Arthur M. Hickox showed his fine apparatus to splendid advantage, using as an object crystals of brucine under polarized light. Dr. Thos. Morfaw showed microscopic engraving on glass and Mollers typen platte. Dr. S. M. Mouser, president of the society, showed objects which attracted much attention—one especially, trichina spiralis, the dreaded parasite which is sometimes obtained from eating raw pork. Dr. F. Rehil exhibited bacillus tuberculosis, supposed to be the germ causing consumption. J. Z. Davis, Professor Thomas Price and F. L. Howard presented exhibits of interest.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Alice, Oct. 13, \$52,784; Moulton, 14, \$99,866; Queen of the Hills, 13, \$1000; Hanauer, 13, \$93,800; Silver Bow, 15, \$23,584; Lexington, 15, \$25,056; Marget Ann, 15, \$32,541; Hanauer, 14, 3270; Stormont, 16, \$28,855; Hanauer, 16, \$33,660; Queen of the Hills, 16, \$11,000; Hanauer, 15, \$33,300. The following shows the bullion product of the different Montana mining companies named, from January 1 to August 31, 1886: Alice, \$771,243; Boston & Montana, \$417,137; Elkhorn, \$120,889; Granite Mountain, \$839,000; Hecla, \$251,303; Helena M. & R. Co., \$240,234; Hope, \$102,456; Lexington, \$607,729; Montana Co., \$1,062,200; Moulton, \$514,966.

 350,793.—KNITTING MACHINE—Frank Wil- comb, S. F.  
 350,794.—KNITTING MACHINE—Frank Wil- comb, S. F.  
 350,795.—KNITTING MACHINE—Frank Wil- comb, S. F.  
 13,720.—TRADE MARK—J. J. Mack & Co., S. F.
- NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

**New York Metal Market.**

Telegraphic advices dated Oct. 21st give the fol- lowing New York prices:

- BORAX—5½¢ @ 6¼¢.  
 BAR SILVER—97.50 per oz.  
 COPPER-LAKE—\$11.25 @ 11.37½.  
 IRON—No. 1, \$17 @ 18.00.  
 LEAD—\$4.85 @ 4.95.  
 QUICKSILVER—54¢ @ 55¢.

The following is the latest by mail from the "New York Metal Exchange Market Report":

- COPPER—Steady, spot closing @ 11.20c. Trans- ferable Notices (Lake) issued at 11.30. Trans- ferable Notices (Chili Bars) issued at 11.15.  
 LEAD—Dull at \$4.25 @ 4.35c spot. Transferable Notices issued at 4.30.  
 TIN—Active at \$22.25 @ 22.30. Transferable No- tices issued at \$22.40.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering ex- tremes of buyers' and sellers' views. All prompt de- livery.—Australian Tin, \$22.60 @ 22.90; Billiton Tin, \$23.00 @ 23.25; Banca Tin, \$23.00 @ 23.50; Baltimore Copper, \$9.75 @ 10.25; Orford Copper, \$10.25 @ 11.00; P. S. C. Copper, \$10.25 @ 11.00; Foreign Lead, \$4.50 @ 4.80; Foreign Spelter, \$4.70 @ 4.75.

MAKER'S PRICES.—At tidewater. 100 ton lots of listed irons (when brand is specified) range nom- inally about as follows: Lehigh, Grade No. 1, \$18.50 @ 19.50; No. 2, \$17.50 @ 18.00; Grey Forge, \$16.00 @ 16.25. Hudson River, Grade No. 1, \$18 @ 19.00; No. 2, \$17.50 @ 18.00; Grey Forge \$15.50 @ 16.00. Southern, Grade No. 1, \$18.00 @ 19.00; No. 2, \$17.00 @ 18.00; Grey Forge \$15 @ 16.

**Don't Fail to Write.**

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some ir- responsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

**THE ROLLER ORE FEEDER**

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

**Golden State and Miners' Iron Works.**

Sole Manufacturers,  
 227 First Street, San Francisco, Cal.

**Acid-Proof Paint.**

Among the meritorious exhibits at the Me- chanics' Fair, to which was awarded a Silver Medal, is the display by the Paraffine Paint Company, whose main office is at 310 California street. The property which this paint pos- sesses of resisting acids and chlorine gas, as well as defying the effect of long submersion in water, makes it of particular value in gold mills using the chlorine gas process, the tanks containing the solution being rendered water- tight and impervious to the acid by its use. It has been adopted, among other places, at the Amador Reduction Works at Sutter Creek, and the Phoenix works at Drytown, Cal., where a variety of substances had been used without success. This paint is also used extensively in woolen mills for coating tanks and iron pipes in contact with acids.

**California Inventors**

AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of Infor- mation. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 252 Market St., San Francisco. Elevator, 12 Front St.

Should consult DEWEY & CO.

AMERICAN

**DIVIDEND NOTICE.**

OFFICE OF THE

**Paradise Valley Mining Company**  
 San Francisco, California.

At a meeting of the Board of Directors of the above- named company, held September 29, 1886, Dividend No. 9, of Twenty Cents (20c.) per share, was declared, pay- able on Thursday, the 30th day of September, 1886, at the office of the company.

W. LETTS OLIVER, Secretary.

OFFICE—No. 328 Montgomery Street, San Francisco, California.

**D. W. STONE, WHO MINED AT MUR-**  
 phy's Camp in 1882 and at Sonora in 1885, will please address G. A. GELIEN, Vallejo, Cal. Important.

**RUPTURE**

RADICALLY CURED BY  
 Dr. Pierce's Great Discovery. Thousands of patients  
 cured AT THEIR HOMES. No experiment! It does the work  
 DRS. PIERCE & SON, 104 Sacra to st., San Francisco, Cal.

**Engraving.** Superior Wood and Metal Engrav- ing, Electrotyping and Stereotyping done at the office of this paper.

**THE FRISBEE-LUCOP MILL,**

**A CENTRIFUGAL ROLLER MILL**  
 —FOR WET OR DRY—

**Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fine- ness in a rapid and economical manner.**

Any method of amalgamation may be applied. At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet. All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco. Certificates as to performance of the Mills, and any information required, furnished on application.

**THE FRISBEE-LUCOP MILL CO.,**  
 Office, 104 & 106 Washington St., NEW YORK.  
 OR PACIFIC IRON WORKS, SAN FRANCISCO.

**SQUARE FLAX PACKING.**

Finest Packing in the world. Trial Samples sent free. Send for circular. Best of ref- erences. Manufactured by W. T. Y. SCHENCK, 256 Market St., San Francisco.

**THE ORIGINAL Roller Ore Feeder.**

This form of Ore Feeder is well adapted for its peculiar work.

In reference to a similar form of "Roller" Feeder, which is being manufactured and offered for sale in this city, and of which a cut appears in this journal, we have to say that the Superintendent of the Bunker Hill Gold Mining Company states that the "Challenge" is far su- perior to the "Roller," he having had both of them operating side by side. We shall be pleased to show this letter, upon application, to any one interested.

We are also manufacturers of the "Challenge" and "Stanford Improved."

Prices furnished by the  
**JOSHUA HENDY MACHINE WORKS,**  
 39 to 51 Fremont St., San Francisco.

**ORE FEEDERS.**

We direct attention to an advertisement, which ap- pears in our journal, of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder, known as the "Templeton Roller," claim that it is su- perior to any other style, and cite those in operation at the "Bunker Hill" mill in Amador county, we expressly contradict the statement, and in substantiation submit a copy of a letter shown to us by a representative of the "Joshua Hendy Machine Works," which speaks for itself

BUNKER HILL GOLD MINING Co.,  
 AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I con- sider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ores to the bat- teries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will sluice right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly,  
 (Signed) N. W. CROCKER, Supt.

**LIFE SCHOLARSHIP, - \$75.00**  
 Full Business Course.

**SIX MONTHS' COMBINED COURSE, \$75.**

Including the Business Course, Academic Course, Mod- ern Languages, Telegraphy, Shorthand, Type-Writing, etc. Ladies admitted into all Departments. Day and Even- ing Sessions during the entire year.  
 CALL OR SEND FOR CIRCULARS.

**American Exchange Hotel,**  
 SANSOME STREET.

Opposite Wells, Fargo & Co.'s Express, one door from Bank of California, SAN FRANCISCO.

This Hotel is in the very center of the business portion of the city. The traveling public will find this to be the most convenient as well as the most comfortable and respectable Family Hotel in the city.

Board and Room, \$1.00, \$1.25 and \$1.50  
 PER DAY, ACCORDING TO ROOM.

Hot and Cold Baths Free. None but most obliging white labor employed. Free Coach to and from the Hotel.

MONTGOMERY BROS., Proprietors.

**HOOD'S FOUNDRY COKE.**

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

**BALFOUR, GUTHRIE & CO.,**

## PRICE, FIVE HUNDRED AND FIFTY DOLLARS

(\$550.00).

**THE**  
"TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

**RANKIN, BRAYTON & CO.,**  
 BUILDERS OF  
**MINING MACHINERY.**

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

### WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

### BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE OF CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

## IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

**BEST SOFT LAKE SUPERIOR COPPER USED.**

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.**

**E. G. DENNISTON, Proprietor.**

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

Centrifugal Roller Quartz Mill.

## Tin Ores.

Tin ore has long been known to exist in the Temescal range, San Bernardino county, California, and considerable money has been spent in prospecting. It is a region of granitic rocks, and tinstone occurs in many places, but chiefly at the Cajalca, where a shaft has been sunk following an irregular vein or mass of amorphous cassiterite of a brown or black color. The tin ore is disseminated in small quantity in small lodes and veins. The region, although affording tin oxide in many places over a considerable area, has never realized the hopeful expectations of those who have made efforts to work it. Several other places in the State have been said to show tin, but garnet is often mistaken for this ore, and no tin in quantity has been so far produced here. Under the cheaper conditions of supplies, labor, transportation, etc., it would seem high time to do some thorough prospecting of the San Bernardino tin fields.

Tin ore has been found in several places in the granitic region of Montana and Idaho, particularly in the Rocky mountains, at the headwaters of the Missouri and in the western drainage, including the streams flowing from the Bitter Root range, especially in the Snake and Salmon and their affluents.

Small quantities of tin ore have been found in New Jersey, Virginia (in several counties), Georgia, Alabama, Texas, and Missouri. By far the best deposits so far found in this country are those in the Black Hills of Dakota. The mines are in the central portion of the Black Hills, a few miles east of Harney Peak, near the dividing range of the region. The Etta, the principal mine, is on an isolated granitic hill rising about 250 feet above the valley, and at an elevation of 4500 feet above sea level. The granitic masses are very coarsely crystallized, and deposits of quartz, feldspar and mica are found. The quarrying for mica on the Etta claim brought the tin ore to notice. Since the discovery of tin at the Etta, it has been found in other similar granitic outcrops, especially at the Bob Ingersoll and Monarch claims, each of which has been worked for mica. The massive tin ore found in the Etta claim was a close association with quartz, feldspar (both orthoclase and albite), and a remarkably large variety of spodumene. There is, in addition, the granular form of the ore, in small crystalline grains, disseminated in the massive micaceous albite rock, which penetrates or is inclosed in the coarse granite irregularly. The ore in the Etta is massive, in bunches with spodumene, quartz or feldspar; or granular or disseminated on a micaceous aggregate or greisen. The area of the tin region of the Black Hills is being constantly extended. Some stream tin is also found. The mines are being worked vigorously.

A NUMBER of discoveries of coal veins have been made recently in various parts of Oregon.

## African Gold Fields.

Considerable attention is now being attracted to the gold fields in South Africa, and in other columns of this number of the PRESS we give a detailed description of the De Kaap and other regions in that country. This will be read with interest by miners, since it gives an intelligent account of the different mines. We were shown, a short time since, a number of specimens from the African mines, which were brought here by Mr. Gardner F. Williams, the well-known mining engineer, who spent last year in the gold and diamond fields of Africa. He, however, does not give any very rose-colored view of the gold mines there, and has condemned some of the properties on which large amounts had been expended. Some of the companies have employed people to lay out and conduct their works who were totally in-

## Two Good Camps.

A prospector who has been out all summer in Idaho and Montana and traveled over considerable rough country, writes us that he was in one camp on Horse creek and Owl creek, Lemhi Co., Idaho, which promises well for the future. There are large bodies of galena ore and some brittle silver. The ore is "smelting" and the ledges large, but with low-grade ore. There is plenty of timber and water. There are no roads to the camp, though one could be made from Bitter Root valley. The trail is 75 miles long. It is a good camp for capitalists, but not so for a poor man. There are 40 locations in the camp and plenty of timber along the trail.

Another good camp is at the Sweathouse mines, Missoula Co., Montana. The ores are high-grade gray copper and ruby silver. A

## A Small Quartz Mill.

There are several small mills in the market, some of which crush considerable rock, but are not good gold-savers. And some are cheaper than stamp mills in first cost, but are of such mechanical construction that the wear on them is great. The mill, a representation of which is shown on this page, is a patented one invented by a practical miner, and has been used by him and others successfully, though until now it has never been properly constructed or brought to the attention of the mining community.

The mill itself is so simple, as the cut shows, that the whole thing can be readily understood at a glance. It is claimed to combine the advantages of the regular stamp both as a crusher and gold-saver, while the cost is so reasonable that it is within the reach of all, and the expense of setting is nothing.

There is no part of this mill that can get out of order, and no chance for wear except on the shoes and dies; and these being large and made of hard metal will last a long time. All parts of the machine are simple and strong.

The operation is a reciprocating one, requiring very little power, for gravitation does half the work, the effect being to throw the weight of the boss (1200 lbs.) in unison with the force of the reciprocating power alternately and separately on each shoe, creating sufficient agitation to expel

the pulp as fast as it is reduced, while the gold is retained in the mortar in amalgam.

The result is substantially the same as obtained in the regular stamp battery, which is known to be the best gold-saver. Messrs. Tatum & Bowen, of this city, the manufacturers, not desiring to overstate the capacity of the machine, place it at six tons in 24 hours through a No. 40 screen. The weight is about 3000 pounds and about four-horse power is required to run it.

MASTER IN CHANCERY S. C. HOUGHTON leaves for Plumas county next week to make a survey to determine certain boundary lines of the Sierra-Butte Mining Co.'s claim. There are several tracts in dispute before the U. S. Circuit Court. A number of the attorneys in the case will accompany Mr. Houghton.

THE Wallapai (Arizona) Tribune says: Mexicans are taking a great deal of gold out of the old placers near old Greenwood, this county. They have sunk a shaft to bedrock in the gravel, and found a great deal of coarse gold in the bottom. In three weeks, over \$1600 were taken out by a few workmen.

TURTON & KNOX, of Sacramento, have taken a contract to build the Westside & Mendocino Railroad from the town of Willows, Colusa county, through Round valley, Mendocino county, and to the head of Eel river.

JAMES' PATENT RECIPROCATING QUARTZ MILL.

experienced in gold mining, and the result has been large outlay on ground too poor to prove remunerative.

All accounts agree that the country is not one to which miners without means should go. Expenses of travel are great, and no "poor man's diggings" have been found. In gold quartz there, as elsewhere, capital is necessary to conduct operations. The routes to the mines are laid down in the article on pages 278 and 279, but people who have been thinking of going there should seriously consider the chances before starting. No doubt Mr. Williams, who is now in this city, would be glad to give any information on the subject to those who may call upon him.

EDWARD EDDY, of Omaha, and owner of extensive smelting works at Denver, has found a most active demand in London for first-class mining properties, especially where gold is to be had, and the holders of such properties are passing through New York and going to London to effect their sales, several very large ones having been made there during the past few weeks.

GOLD is not now being coined at the Mint, in obedience to orders from the Treasury Department. Silver coinage has been resumed, however, and by the end of the month \$300,000 worth of that precious metal will be turned into dimes and dollars.

wagon can be driven to the mines on the foothills of the Bitter Root valley. There is plenty of wood and water. The Pleasant View mine is owned by Captain Higgins, of Missoula—the banker—and Mr. McCormick, of Stevensville. Our correspondent predicts that this district will be a lively camp next summer.

THE MONO MINE.—The suit of Thomas Holt vs. John Bliss has been transferred from the Superior Court of this city to the United States Circuit Court. The action is brought to obtain possession of the property of the Mono Lake Hydraulic Mining Company. The plaintiff states that in 1882 the property was mortgaged for \$45,241.60. The mortgage was foreclosed in 1885. The premises were sold for \$45,585.44 in January, 1886, and the plaintiff claims to have been the highest bidder. But the defendant (Bliss) claims to own an interest and title in the premises, sold under a sale made by the sheriff on January 22, 1884, under an execution issued by the Superior Court for San Francisco on a judgment recorded in said court on December 19, 1883, in favor of George Leviston vs. the Mono Lake Hydraulic Mining Company, and under redemption made by one Joseph Wilson on January 7, 1885. It is now prayed that judgment be entered for the plaintiff in the present suit.

A NEW machine is being tried in Coos Co., Or., for separating gold from black sand,

## CORRESPONDENCE.

We admit, unaltered, opinions of correspondents.—Eds.

## Zinc Assay.

(Written for the MINING AND SCIENTIFIC PRESS  
by C. H. AARON.)

It is a hobby of mine to dispense with the use of hydrogen sulphide and ammonium sulphide in common assaying. Especially is this desirable in the assay of zinc, for, as every chemist knows, the zinc sulphide is a troublesome substance to handle. It is true that the volumetric methods avoid the necessity of settling, filtering and washing the zinc sulphide, which in some of them is not even produced, yet, in the case of complex ores they require the use of hydrogen sulphide for removal of other metals; moreover, the volumetric methods are only advantageous where zinc assays are tolerably frequent.

In the West it is seldom if ever necessary to assay zinc ores proper, but only to determine the proportion of zinc in our ores of gold, silver and lead, on account of its effect on the working expense, and therefore the selling price of those ores. As hydrogen sulphide is a troublesome and offensive reagent, requiring special appliances, and ammonium and sodium sulphides are liable to decomposition if long kept, while the separation of metals as sulphides is an operation requiring considerable care and skill, I have thought it desirable to devise a gravimetric method in which the formation of sulphides should be avoided, in which only stable reagents should be used, and in which special apparatus should be needless, while at the same time the method should be applicable to ores of considerable complexity.

After many failures, I have succeeded, not indeed in discovering any new reaction, but in applying what I believe to be a new combination of known reactions to the purpose required. If my process or a better one as regards the object in view is already known, my excuse for offering this description of it must be the comparative isolation of my present position which prevents my being as well posted as is desirable.

The ore may contain, besides zinc, the following elements, in combination with each other or with sulphur or oxygen: Fe, Mn, Cu, Ag, Pb, Hg, As, Sb, Sn, Cr, Al, Mg, Ca, Ba, Sr, Si (to which may doubtless be added Bi, Te, Se, and probably P. and Mo).

For the assay I prefer to take 36.5 grains, or an aliquot part or simple multiple of that quantity, according to the supposed richness of the ore and the delicacy of the balance in use. My reason for this preference is that the compound finally got for weighing is the zinc ammonium phosphate, which contains 36.49 per cent of zinc; so that, if 36.5 grains of the substance be taken, the weight of the final product, in grains, is equal to the percentage of zinc in the substance. With ordinary ores, half the quantity named would be ample, while with a rich ore one-tenth would suffice, and the weight of the product got would have to be multiplied in the ratio in which the standard quantity was divided. The same system may be adapted to gramme weights; for instance, if we take 365 mgs., the weight of the product in mgs. divided by 10 is the percentage of zinc in the ore.

One advantage of the determination as zinc ammonium phosphate is the high molecular weight of that compound, which enables one to work conveniently on small quantities of substance; another is that it can be used in the presence of ammonium salts, and the precipitate is collected and washed with quite as much facility as the carbonate, while not requiring to be ignited. This method of final determination is not confined to the process which I am now about to describe, but may be used with any process in which the zinc is got in solution as sulphate or chloride (doubtless also nitrate), free from earths and otherwise fit for precipitation as carbonate, except that, as above noted, the ammonium salts are no impediment.

Having weighed a suitable quantity of the powdered and dried ore, proceed as follows:

Digest in a boiling mixture of nitric, hydrochloric and sulphuric acids; let the nitric be in excess of the hydrochloric, and boil down with sulphuric until the other two are expelled, the heavy fume of the sulphuric acid is seen, and not much of the latter remains. Add some water; again boil, and, after the lapse of a few minutes to allow the soluble sulphates to dissolve, and still boiling, add solution of sodium thiosulphate as long as it makes a dark precipitate; this throws the copper down, lead, silver, antimony, tin, barium, strontium, having been converted into insoluble forms by the acid treatment.

Filter and wash. Heat the liquid to boiling and add crystals of potassium chlorate until the turbidity which is at first produced disappears, and a slight odor of chlorine is perceptible (it may be necessary to add a few drops of sulphuric or hydrochloric acid). To the clear liquid add ammonia in large excess, from three to five grains of ammonium carbonate, and,

after a few minutes, solution of sodium phosphate by drops as long as it seems to increase the turbidity, and a few drops more. The ammonia precipitates iron and alumina, and mercury; the carbonate throws down any alumina and lime that may have remained dissolved, also a portion of manganese if there is much of that; the sodium phosphate completes the separation of manganese and magnesia. As to whether the arsenic is removed or not depends on its state of oxidation and its proportion to the iron present; the question is unimportant. We have now to get rid of the chromium; this is effected by boiling for 10 minutes, after which filter, and wash slightly. Redissolve the residue by pouring slightly diluted sulphuric or hydrochloric acid upon it in the filter, receiving the solution in a clean vessel. Treat this solution exactly as before with ammonia, etc., finally boiling for 10 minutes. The object of this double treatment is to recover some zinc which goes down with the iron, etc. Filter through the same filter and into the same vessel as before, and wash thoroughly, first with ammonia and then with water. To the solution add a few drops of sodium phosphate solution, and let it stand a short time; this is to insure the complete removal of manganese and magnesia, so that, if a precipitate forms, you must filter again; but if enough phosphate was used before, there will now be no precipitate. To the clear liquid add sulphuric or hydrochloric acid, which may at first be strong, but later must be dilute, stirring meantime, until the reaction is faintly acid. If, as is probable, there should be a slight excess of sodium phosphate in the liquid, a white precipitate will form when the neutral point is approached, and this is a useful indication; in any case, as soon as blue litmus paper shows a slight purple tint when dipped in the liquid, add sodium phosphate as long as it precipitates, and then a slight excess. Now heat nearly to boiling until the precipitate curdles and settles, leaving the liquid clear. Filter, wash dry on the water-bath and weigh. The filter must be tared or counterpoised, and before washing the precipitate it is best to make sure that all the zinc is down, by adding to the filtrate a few drops of sodium phosphate. If that produces no cloud, divide the liquid in two parts; to the one part add a drop or two of dilute acid. If still there is no cloud, test the other part with a drop or two of dilute ammonia. If a cloud is produced by either test, the precipitation is imperfect and must be completed, and the liquid, after heating, must be again passed through the filter. If the work is properly done, no zinc can be detected in the liquid by means of ammonia and ammonium sulphide. The dried precipitate should be quite white, otherwise it is not pure. It may, however, retain a trace of chromium without serious detriment to the result, as a little zinc will in any case be lost. If magnesia is allowed to remain, it will not betray its presence by any color.

In my experiments I get from 98% to 99% of the taken weight of zinc. More accurate results may be got by proceeding as follows: After removal of copper and boiling the filtrate with potassium chlorate, convert the sulphates into chlorides by adding solution of barium chloride as long as it precipitates; then add moistened barium carbonate in excess and digest cold with frequent stirring for some six hours. This will precipitate the iron, alumina and chromium, also indium if present, which must be filtered out, and on addition of ammonia, ammonium carbonate and sodium phosphate, the lime, magnesia and manganese will precipitate. It is not now absolutely necessary to boil the liquid before filtering, yet it may be better to do so, as that will insure the complete removal of chromium and will cause the filtration to proceed better. After removal of this precipitate by filtering, proceed to determine the zinc as before.

In the absence of copper the treatment with sodium thiosulphate may be omitted, as also the boiling with potassium chlorate. In the absence of chromium, the boiling of the ammoniac solution is not necessary, as the ammonium carbonate will throw down a part of the manganese if there is much of that, and the sodium phosphate will remove the remainder. The process then becomes more simple, as follows:

Digest in three acids as directed, and filter. To the filtrate add ammonia in excess, ammonium carbonate and a little sodium phosphate; keep warm for some time and filter. If the precipitate is in considerable quantity, redissolve and repeat the precipitation in the same way.

Test the filtrate with a little sodium phosphate to see that no lime, magnesia nor manganese remains; if necessary, filter.

Make the liquid faintly acid and determine the zinc as above.

Some writers recommend the conversion of the precipitate of zinc ammonium phosphate into zinc pyrophosphate containing 42.76 per cent of zinc; if this be done, the taken weight of ore should be 42.76 or a multiple or aliquot part of that; but I have tested the conversion to pyro-phosphate and found no difference in the result, hence do not think it worth the trouble; it is effected by heating in a porcelain crucible until the weight is constant.

The dividend recently paid by the Martin White mine, of Nevada, was somewhat of a surprise. The company recently realized \$15,000 from the milling of 1100 tons of low-grade ore. This is the third dividend paid by this mine since May, 1879.

## New Gold Fields.

The De Kaap Mines, South Africa.

South Africa is a country of surprises. It is barely 20 years since the existence of diamonds along the Vaal river became known, and soon after followed the discovery of the Kimberley mines, which in richness and extent have quite eclipsed those of India and Brazil. The yield of precious stones of all kinds and qualities extracted from the diamondiferous earth since that time is estimated to have reached four or five tons weight, of the gross value of £40,000,000. Diamond mining has become one of our settled and permanent industries; underground shafts have supplanted open workings, a population of about 30,000 inhabit the townships at the four mines around Kimberley, and the ordinary expenditure distributed among the community for labor, machinery and material employed in working amounts to no less than £2,000,000 per annum; while from January to July last the amount paid out to shareholders in the dividend-paying companies was over £250,000.

Now, in another part of the country, says a Cape correspondent of the London Times, since the beginning of this year the existence of a great gold-field has been demonstrated beyond doubt; a series of auriferous quartz-reefs and lodes having been discovered and developed, some of them yielding as rich returns of the precious metal as have been found in any part of the world.

## This Auriferous Tract,

Generally termed the De Kaap Gold-fields, is situated on the eastern side of the Transvaal, where the uplands of the Drakensburg mountains slope off in a succession of terraces and broken hills and valleys to the lower range of the Lebombo, about 120 miles from Delagoa bay. The greater part of it is within the territory of the South African Republic, but it extends over the western and southern border into the adjoining native territory of Swaziland. The Crocodile river to the north, and the Komati river to the south, nearly encircle the area at present attracting attention. Midway between them the Kaap river, with its tributary, the Queen's river, flows through the picturesque Kaap valley, surrounded by an oval of hills, some abruptly rising to 1000 or 2000 feet high. The formation consists chiefly of argillaceous slates and schists, sandstones and conglomerate, in some places disturbed by granite and traversed by quartz-reefs and igneous dykes. The reefs are, for the most part, vertical and run almost due east and west with a southerly inclination. There has been more or less of alluvial ground worked in some of the hills and terraces within the area, but the search for and development of quartz-reefing is the industry on which all on these fields are absorbingly engaged.

## Gold Mining has been Pursued,

For years past, with the usual proportion of success and failure in the district of Leydenburg, immediately north of De Kaap; but it was not until 1883 that attention was drawn to this locality by the discovery of a reef on what is known as the Pioneer Hill. The ground on which the reef was situated formed part of a number of farms, which were the property of Mr. G. P. Moodie, formerly Surveyor-General of the Transvaal, and these were bought by a Natal company, which was at once formed with a capital of £240,000, and a directorate in Maritzburg, who threw open four of these farms to prospectors subject to licenses and royalty, retaining the others for further development. Early in 1884 several other gold-bearing reefs were found on Moodie's ground and also on adjacent Government ground lying to the north and eastward. The latter circumstance led to the Transvaal Government proclaiming the Government lands as a public gold-field in 1885. Messrs. Barber Brothers (from the Cape Colony) then discovered the Umcochiwa reef, and gave their name to the mining township of Barberton, which has sprung up around it.

The discovery of the Umvoti and Central reefs in the immediate vicinity soon followed, and subsequently

## Prospectors Gradually Extended Their Area

For a distance of 10 or 15 miles from Barberton, where the Sheba reef was found by Messrs. Hillary Brothers, and, later on, Messrs. Bray and Griffith hit upon what is known as Bray's Golden Quarry, near the Sheba reef—a huge dyke of quartz, and the quartzite standing out in mass on the hillside, which previous prospectors had passed by, not conceiving it possible to be, what it has since proved, gold-bearing rock of exceeding richness. This property was formed into a company named the Sheba Reef Gold-mining Company, with a capital of £15,000 fully paid up in £1 shares. They were able, after their first crushing, to pay a dividend and acquire some adjoining ground, in all about 10 claims, the capital of the company remaining the same. Later on they alienated six claims, and formed these into a company called the Edwin Bray Gold-mining Company, the shares of which (£25,000) were divided pro rata among the original shareholders. The company also purchased an interest in the Sheba Steam Tramway Company, formed for the transport of the quartz from the hill down to the mills at the river, six miles distant. These shares were also divided pro rata among the original holders. The reef on the Sheba Com-

pany's property is exposed to view, owing to the footwall having given way. It shows to a depth of about 500 feet, and is from 4 to 5 feet in width. Besides this reef the company possesses the before-mentioned Bray's Quarry, from which about 600 to 700 tons or more of quartz have been taken and crushed, giving a yield of 8 ozs. per ton. The tailings from these crushings have been tested, and proved to contain 4 ozs. per ton. The loss is owing to the sulphate of iron, which covers the gold in a thin coating, and prevents the quicksilver on the copper plates from catching the gold. Fifty tons of this ore have been bought, at £25 per ton, by Mr. Crawford, of Newcastle, who has shipped some to London for proper treatment. The quarry shows about 50 feet in width, payable, undefined walls, and about 50 feet deep. No limit has been discovered to the quarry, and the richness of the ore does not vary in going lower.

On the Sheba reef, the Oriental and the Nil Desperandum Companies have a series of claims, and the Standard Company have also some ground; but as yet no discovery has been made like the Quarry. The Oriental (owning 36 claims—each claim on these fields being 150 by 400 feet) have a drive at the low level, about 300 feet from surface, and have thoroughly established the permanence of the reef; the yield by the primitive method of "dollying" being reported equal to 8 ozs. per ton. The Nil Desperandum (Hillary's) have large reefs on their ground—the one is the Sheba proper and the other is a parallel vein of lesser width, but containing good gold. Another company—the Wheel of Fortune—have the reef exposed for nearly 100 feet. It is about 3 feet wide and vertical, with every advantage for mining. The last crushing gave  $4\frac{1}{2}$  ozs. per ton.

Running parallel with the Sheba reef, but on the north side, at the distance of about half a mile, is a piece of ground known as Thomas', the property of two brothers of that name, said to be Cornish miners. While the two brothers were prospecting, one of them was taken ill and sat down at a spot where he saw something glittering before him. He examined the shining substance, and the result was that they sunk a shaft which has yielded some of the very richest ore. It is doubtful whether it is a "reef" or only a "chimney," or fissure, they have found. The brothers, however, made £200 a week by crushing the quartz with a "dolly," the yield giving the magnificent return of from 25 ozs. to 100 ozs. A week or two ago they parted with their property for the sum of £60,000 cash, which was paid them by Messrs. Adler Bros., representing a syndicate of Cape, Natal, and English capitalists.

## While the Richness of the Sheba Hills

Is impressed upon us by facts such as the above, there are numbers of properties on which systematic work is being carried out for their development. The pioneer reef, on the ground of Moodie's Mining and Exploration Company, has been traced through the claims of the Bee Hive, Whitehead, Pioneer, Tiger Trap, and Natalia Companies. In most of the claims the reef has been developed down to the 250-foot level, and varies from 2 to 3 feet, with an average yield of about 2 ozs. per ton. All these companies have machinery erected or in course of erection, and work with water power. Whitehead has 12 gravitation stamps, worked by a turbine. The Pioneer Company have six stamps worked with a Pelton water-wheel. Tiger Trap has five stamps, worked with an overshot water-wheel. Natalia and Bee Hive have ordered machinery from England. The Union Company's block on the Allan reef have also ordered machinery, and have a reef about 3 feet in width, to work which will yield about 2 ozs. per ton. Companies are in course of formation to develop and work the extension of the Allan's reef and Ivy which are adjacent. From Brickhill and Millbourne's claims (the Alpine), according to the royalty paid to Moodie's Company, the yield has equaled 11 ozs. to the ton. The Golden Hill Gold-mining Company have two separate reefs, which, in the present low level drive, have been found to join issue and now form a large lode of from 3 to 4 feet in width—the yield is from 1 to  $1\frac{1}{2}$  oz. per ton, and can be worked with water power. Abbott's reef has been opened up to 150-foot level, and shows 2 to 3 feet, yielding about an ounce or more per ton to be worked with water power. Bredas and Endore reefs are undeveloped; both veins show visible gold freely, and have lately been acquired by the Moodie's Company. The Moodie's Gold-mining and Exploration Company have a 10-stamp Sandycroft mill at work, in Concession creek, which is driven by a turbine water-wheel. Just below its site the Rosetta Company are erecting a 15-stamp battery; they have opened their reef to a level of 100 feet, and have different shafts and tunnels; their ground is being stoped and stacked for milling. The width of the vein varies from 4 to 16 feet and yields from 10 dwts. to  $2\frac{1}{2}$  ozs. per ton. Prellers, Stevens, and other reefs, near Barberton, are in an undeveloped state, but have excellent prospects. There are other parties on equally hopeful ground, higher up the range. The Victoria Company, one of the earliest established, has given a return of 31½ per cent in their dividends on their capital since their formation. They, as well as the Caledonian, have batteries worked by water power. The Sheba Company have purchased the 10-stamp battery erected by Mr. J. C. Rimer. Altogether, there are over a dozen crushing mills at work on the fields, but for the extent of operations, this is very small and in-

adequate. When the means of transport of the quartz from the reefs to the mill is improved, and proper gold-saving machinery introduced, it is fully expected the profits will be considerably increased, as the yield of gold will certainly be greater when subjected to more economical, careful and scientific treatment.

Within the last eight months, during which the export of gold from South Africa is believed to have amounted to about £122,000, the importance of these fields gradually has been thoroughly impressed upon the colonial public. Natal was first in the field furnishing capital to work the various properties prospected; the Cape Colony and Kimberley especially are now investing and co-operating in their development; and from all parts of South Africa men are turning their eyes and hazarding their chances on the glittering possibilities of the Barberton and Sheba reefs.

#### Numerous Mining Companies.

Under the limited liability law of the South African Republic, have already been formed, with an aggregate capital of about three-quarters of a million. Here is a list of these associations already before the public, with the amount of their capital in £l. shares, but new ones are being added to it from month to month:

#### AMOUNT OF CAPITAL IN £1 SHARES.

Victoria .....	£12,000	Nil Desperandum .....	£25,000
Caledonian .....	20,000	New Bonanza .....	4,000
Sheba .....	15,000	Pretoria .....	20,000
Abbots .....	12,000	Rosenda .....	12,000
Barberton .....	15,400	Standard .....	10,000
Middleton .....	15,000	Figer Trap .....	12,000
Kidson .....	18,000	Edwin Bray .....	25,000
Golden Hill .....	3,000	Wheel of Fortune .....	25,000
Rosetta .....	15,000	Pigg's Peak .....	200,000
Central .....	15,000	Oriental .....	60,000
Union .....	20,000	Barberton Prospect .....	12,000
Blue Rock .....	15,000	Victory .....	30,000
Beehive .....	20,000	De Kaap .....	30,000
Colonial .....	60,000	Imperial .....	8,000
Natalia .....	8,000	Alpine .....	25,000

With the formation of companies, scrip-broking soon produced its usual consequences; dabbling in shares suddenly became a feverish passion with a large number of persons, and the scrip of nearly all the companies floated is now at high premiums—some at monstrously inflated prices—out of which a goodly number of the operators have made handsome profits. Fortunately, the banking institutions have given no encouragement nor offered any facilities for carrying on this speculative game; and the classes who have engaged in it are presumably men with available capital dealing with their own means.

#### Climate.

With regard to the climate of De Kaap, it is excellent on the high lands and elevated plateaux throughout the whole year; but after the rainfall of summer, from February to March and April, the lower levels and valleys are malarial. At present the direct passenger and postal route is from Cape Town to Kimberley by railroad, and thence via Pretoria to Barberton by passenger coach. The other route is by Natal; proceeding by rail from the port of Durban to Ladysmith; thence by stage 280 miles to Barberton. This place has now a population of 2000, with hotels, etc.

Besides these De Kaap gold fields, considerable attention has been excited by the more recent discovery by Mr. Struben of another gold field in the heart of the Transvaal, near the capital of the State. The field is about 35 miles south of Pretoria on a plateau forming the water divide of the Transvaal on the Heidleburg side of the Witerwater's Rand. There are some ledges in cement or conglomerate. A number of farms have been declared open to the public by the government, as they are traversed by gold reefs. The yield is from one to one and one-half ounces per ton.

From Bechuanaland there is news of quartz veins with gold near Mafeking. Meanwhile, within the Cape Colony, alluvial gold diggings have been found in the district of Krusna.

It must be borne in mind, however, that no "poorman's diggings" have been found in the country. To get gold, capital and intelligence, with energy and enterprise, must be forthcoming. But there is no doubt that, as after the discovery of the diamond fields, the country is now entering on a new course of prosperity, and that financially, socially and politically, a great future is in store for South Africa.

**IMPORTANT TO MINERS.**—Says the Ouray (Col.) *Solid Muldoon*: The fact that several of our exchanges have inserted two or more claims in one notice of forfeiture, and being in doubt as to the legality of such a notice, we wrote Hon. R. H. Morrison, of Georgetown, upon the subject and received the following:

**D. F. Day**—DEAR SIR: Yours received. The Supreme Court has decided that the affidavit of annual labor may include more than one claim. (McGinnis vs. Egbert, 8 Colo. 41.) I have no doubt that a forfeiture notice may also include more than one claim, but it should be specific and several as to each claim which it includes. The miner has the right to redeem any one lode and let the others go, and it should not be so worded as to apparently impose any condition upon his absolute rights. Instead of anticipating these points it is better, as a rule, to advertise each claim separately.

Yours truly,  
R. H. MORRISON.

WORK is to be resumed at the Mount Cory mine. The shaft is already down 100 feet below the water line, and will now be carried 100 feet lower. An assessment of \$100,000 has just been collected for that purpose.

#### The Great Statue.

The great statue "Liberty Enlightening the World" has been formally presented to the American people and dedicated to its work of sending forth radiance which shall symbolize to the world the light of liberty. The statue is a gift to the greatest Republic of the world from the greatest Republic in Europe—a tribute of honor and esteem to the oldest popular government from a sister nearly a century younger. The gift and its formal acceptance, with all the sentiments involved therein, may be looked upon as constituting one of the greatest events in the history of the world's progress.

On Thursday, October 28th, the formal dedication of the statue took place. The vener-

able De Lesseps, General Grevy, brother of the French President, and Senator Lafayette, great-grandson of the Lafayette whose name will live beside that of Washington, were among those present.

From the many allusions made to the statue in our columns, our readers may be considered informed upon the general facts of the origin of

to confer with Americans concerning his work. On his arrival he was struck with the beauty of New York harbor, and seeing Bedloe's island conceived the idea of a colossal statue which should be much larger than any hitherto erected. As Liberty has reached its highest estate in this country, it seemed right that the statue should represent "Liberty Enlightening the World." This would be a lasting acknowledgment of France's good-will and at the same time light up the harbor at night, embodying a lofty sentiment and conferring a practical benefit.

After he returned home the plan was put into execution, the money raised, and work commenced on the statue. It has occupied eight years of Bartholdi's time and the greater part of his fortune to complete the work.

The engravings on this page will be studied with great interest because the occurrence of the

BARTHOLDI.

the statue and many things about its progress from its inception to its completion. Suffice it to remind them that the money for the statue was collected by small voluntary contributions from the liberty-loving citizens of France. The task of embodying the sentiments of the contributors in fitting form was intrusted to the sculptor, Bartholdi. He came to this country

dedicatory ceremonies makes their appearance timely. There are many standards set up by which to estimate all efforts. Possibly allusions to the immensity of the figure are not the highest tribute which can be paid to it, and yet they are the most easily grasped. The statue is the largest in the world, and higher than any of the colossal statues of antiquity. The Colossus of Rhodes was only 105 feet high; this is 151.5 feet high. The height of the pedestal will be 91 feet and that of the foundation 52.1 feet. In position it will loom up 305 feet above tide-water. Its weight is 440,000 pounds, of which 176,000 pounds are copper and the remainder wrought iron. While it was being built 40 men found standing-room within the head, and men jumped with ease in and out of the tip of the nose. A six-foot man, standing on the level of the lips, just reaches the eyebrow. Ten people can stand with comfort inside the torch and 15 people may sit around its flame. This elevation can be reached by a staircase within the outstretched arm. The width of the eye is 28 inches, the length of the nose 3 feet 9 inches and the forefinger 7 feet 11 inches long.

This imposing statue, higher than the enormous towers of the great Brooklyn bridge or the steeple of Trinity church, which is the loftiest in the city of New York, by its rare artistic proportions, as well as by its stupendous dimensions, will add another to the wonders of the world. A word should be said of its artistic merit. The pose, stride and gesture, with its classic face, are pronounced perfect. The drapery is both massive and fine, and in some parts it is as delicate and silky in effect as if wrought with a fine chisel on the smallest scale. It stands on Bedloe's island (hereafter to be known as Liberty island), in New York harbor. It is one of the most accessible, as well as one of the most pleasant, breathing spots around New York. The solid granite walls of the old fort, which are in good condition, balance well the height of the statue and contrast nicely with the beautiful grass and shade trees with which the island is covered.

The telegraph announced that the exterior of the statue was finished October 14th. Another week was occupied in putting in the apparatus for the electric lights. It was decided to put up eight 6000-candle-power lamps at equal intervals on the balcony about the torch. Reflectors will be placed behind each lamp to intensify the light. The four on the south side, with a combined power of 20,000 candles, will be visible from 30 to 40 miles off. Besides the eight lamps on the torch, there will be four lamps, each of 6000-candle-power, at the base of the pedestal. These will be placed behind the parapets, out of view on the water, for the purpose of lighting the outside of the statue. By obscuring the lights at the base, the outlines of the statue will be clearly visible on the darkest nights.

The day of the dedicatory ceremonies was a general holiday in New York City, having been thus proclaimed by the mayor. Congress appropriated \$56,000 to pay the expenses of unveiling the statue, with the proviso that none of the money should be used for wines or liquors.

Auguste Frederic Bartholdi, the most distinguished living sculptor of colossal statuary, was born at Colmar, in 1833. He started life as a painter, but soon turned his attention to sculpture. At the age of 19 he produced a notable bas-relief of Francesca da Rimini, which won him his first laurels. During the Franco-German war he fought as a volunteer. In 1878 he produced the "Lion of Belfort," a colossal monument to the heroism of a beleaguered garrison, carved in solid rock. In recognition of this brilliant work the Government bestowed on him the Cross of the Legion of Honor. Among his other important work may be mentioned "Vercingetorix," the old Gallic patriot, and the graceful statue of "Lafayette" in Union Square, New York. At the Centennial Exhibition he was awarded the medal for bronze sculpture.

**THE EFFECT OF EARTHQUAKES.**—It is not generally known that the great slide which occurred on the C. S. road in the Cajon pass, on the morning of the 30th ult., was the result of a heavy earthquake. The foreman says that about four o'clock in the morning he was awake by a heavy rumbling and a violent vibration of the earth apparently from east to west. The noise was so loud and so long sustained that it awoke the whole camp. The men turned in again, however, on the cessation of the sound, and did not think, of course, of visiting the big cut, being quite a distance off from it. On going to work in the morning, they found that a disastrous cave had occurred and the railroad bed covered under a miniature Grayback. The side of the mountain from which the cave descended was cracked in various places, the gigantic splits being many of them at right angles to each other. Those great clefts were plainly visible in the moonlight to the writer, when passing, several nights afterward. Superintendent Victor and engineer Perris doubted the truth of the earthquake report at first, but having made a searching investigation among the laborers, they found the statement of the foreman convincingly corroborated, and were themselves convinced that the disastrous slide was the direct effect of an earthquake. Such accidents of course must be borne with resignation, but they are provoking all the same, especially when they apparently come upward from the supposed direction of Sheol. The company had taken every precaution possible; had done everything that skill and money could do to provide against even a possible slide. Swarms of men have been at work for months cutting off the crown of the impending giant banks. But no skill can provide against the ravages of exploding subterranean force. This company has done much for San Bernardino. It will do more still. We therefore feel a disaster occurring to their road as a direct injury to ourselves. But the damage has all been repaired and the trains are now running regularly.—*San Bernardino Courier.*

**THE MANUFACTURERS' ASSOCIATION.**—The Manufacturers' Association is exerting itself to extend its influence and usefulness. At a recent meeting, which was largely attended, a number of amendments to the by-laws, believed to be essential prior to the beginning of the fourth fiscal year, November 1st, were adopted. The following changes were made: First—Reduction of the number of directors from 11 to 7, as experience of all successful organizations show that a small, compact and industrious body is more united and efficient than the larger. Second—The modification of several articles so as to extend the field of membership and create an auxiliary influence from among a large body of citizens who may be directly or collaterally interested in the success of local enterprises, as, for example, owners of property occupied for manufacturing purposes, commission men who handle time products, stockholders in manufacturing corporations, etc., many of whom have shown interest for and disposition to encourage these industries. Third—Reduction of entrance fee to nominal rate of \$5, and quarterly dues to \$3, so as to make the expense of maintenance within co-operation of every one engaged in these industrial pursuits. Life membership was also placed at \$100. The thanks of the association were tendered Senator Stanford and Congressmen Morrow and Felton for their efforts in procuring to the State its share of Government patronage in work and supplies on public institutions.

## TABLE OF CONTENTS.

**EDITORIALS.**—Tin Ores; African Gold Fields; Two Good Camps; A Small Quartz Mill, 277. Passing Events; Subsidies to Mining in New Zealand; Clays; Hydraulic Mines not all Shut Down, 280. Pike's Improved Gold Sluices; The Black Copper Group; Mineral Products of the United States, 281.

**ILLUSTRATIONS.**—James' Patent Reciprocating Quartz Mill, 277. Liberty Enlightening the World; Bartholdi, 279. Pike's Improved Gold Sluice; Fig. 1—Plan of Black Copper Group, Arizona; Fig. 2—Section of Group at Right Angles to Diorite Dyke, 281.

**CORRESPONDENCE.**—Zinc Assay, 278.

**MECHANICAL PROGRESS.**—New Process of Manufacturing Seamless Copper Tubes; A New Process of Welding; Influence of Cold and Strains on Iron and Steel; A Valuable Invention; Compressed Wood for Tooth Gearing and Shuttles; The Wire Age; Locomotive Improvements; Steel Direct from the Ore, 282.

**SCIENTIFIC PROGRESS.**—First Appearance of the Grasses; Influence of Magnetism on Chemical Reaction; New Uses for Potatoes; Important Discovery in Glass; Scientific Poetry; A Curious Sort of Barometer; A Wick for Gaslight; Electrified Bubbles; A New Metal; Origin of Dew, 282.

**ENGINEERING NOTES.**—An Immense Drainage Enterprise; Drainage of the City of Mexico; Another Great Railroad Enterprise; The International Yacht Controversy; An Immense Span, 283.

**USEFUL INFORMATION.**—How to Judge Canned Goods; How to Lay a Tin Roof; A Novel Contrivance to Loosen Keys and Wedges; Shining Black Ink; Antiquity of Hot-air Furnaces; Varnish for Metals; Down Draught in Chimneys; An Ink River; Sympathetic Ink; Iron in Alum; Rapid Weighing, 283.

**GOOD HEALTH.**—A Word to the Wise; The "Noble Forehead" Fallacy; The Science of Drinking; A Remedy for Round Shoulders, 283.

**MINING SUMMARY.**—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 284-85.

**MINING STOCK MARKET.**—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 288.

## Business Announcements.

D. W. Stone Wanted—G. A. Gellen, Vallejo, Cal.  
Assessment Notice—Santa Anita M. & M. Co.  
Assessment Notice—Aultman M. & M. Co.  
Assessment Notice—Acme M. & M. Co.  
Patent Truss—J. G. Henderson, Grizzly Flat, Cal.

## Passing Events.

Interests connected with politics and the coming election attract more attention just now than anything else. In this State the political situation is very much "mixed," there being so many party tickets and independent candidates in the field.

Light rains have fallen in many parts of the State, and in the more mountainous portions the snow has come. In California, with the exception of very few localities, mining is carried on all winter, though outside prospecting operations are more or less stopped, as elsewhere.

Silver continues to advance, much to the delight of silver miners. In fact, not only silver but copper and quicksilver have also gone up. Iron has advanced slightly in the East, but here shows no improvement so far. Lumber on this coast has also advanced slightly, for the first time in many months.

The dedication of the Bartholdi statue, of "Liberty Enlightening the World," in New York harbor, which took place on Thursday, with appropriate ceremonies, is an event of more than ordinary moment, showing, as it does, the sympathy existing between the two great republics of the world.

The mining stock market is very active just now, for the first time in many months, and sales at increased prices bring joy to the heart

of the broker. Not only Comstock but outside mines feel the effect. Ore developments in some of the Comstock mines have brought this about. It is to be hoped that the expectations of the sanguine will be realized.

## Subsidies to Mining in New Zealand.

The gold mines, both alluvial and quartz, of New Zealand, are making an excellent showing, and are apparently increasing their output, after a long depression. Up to the close of the last financial year the total gold yield from the various mining districts in the colony was 10,849,261 ounces, representing a value of £42,566,135; while the separate return for last year gives 233,068 ounces, of the value of £931,628. There are in the colony 11,778 miners altogether, working in gold, coal, etc. The average earnings in the gold fields per miner last year were equal to £80 5s 5d. In quartz mining, comparing the value of gold obtained from such workings against the number of men employed, the average earnings of each amounted to £185 5s 5d.

Of the total value of exports of produce and manufacture last year, the mineral products composed one-fifth. Deducting the value of wool from the total, the mineral product was 39 per cent.

The capital invested in registered companies carrying on gold-mining operations amounts to the nominal sum of £7,089,393, which is the aggregate of 451 companies; the amount of paid-up capital is £1,575,983.

The total quantity of quartz crushed during the past year was 94,016 tons, which yielded 111,432 ounces of gold; while the quantity crushed the previous year was 92,872 tons, producing 88,299 ounces, thus showing a very satisfactory increase.

What to us in this country seems rather a curious feature is the fact that the Government aids the miners in building roads, prospecting, etc. The cost of roads and tracks undertaken by counties in the gold fields last year amounted to £54,137, out of which subsidies paid were £35,630; and the cost of similar works undertaken and wholly paid for by the department of mines was £16,275. So far as the Mines Department is responsible, the total cost of such works constructed and in progress will be, when complete, £150,164. Several roads are being built to open up new mines. From time to time Government aid has been given to prospecting, with the object of developing the mineral wealth of the colony. This assistance has been extended to prospecting associations, companies working at deep levels, and latterly, under regulations made by the Governor-in-Council, based on recommendation to the Minister of Mines by the Gold-fields Committee, to the local bodies, and, under special circumstances, to individual parties engaged in prospecting in outlying districts.

Subsidies in aid of the purchase of diamond drills have been given. The Minister of Mines, however, does not believe in this, and has sent to America to try and find a light and portable machine which can bore 500 feet.

In the last four years the total amount authorized by the Government for the construction of water-races, drainage and tailings channels, roads and tracks, diamond and other drills, and aid to prospecting in the gold fields, has been £244,447, and otherwise paid by way of subsidies the sum of £131,044. Last year the sum authorized for similar works was £76,804. They recognize that roads and trails are very important to open up new districts, and spend a great deal of money in this direction to encourage miners to go to new regions.

The Elkhorn Mining Company, of Montana, paid a dividend of five cents per share, or \$5000, on the 1st, making \$50,000 this year. This is the 27th monthly dividend. It is in contemplation to pay 10 cents per share next year.

The U. S. assay office, at Denver, Colorado, received and purchased last month \$213,500, of which only \$1922 was in silver. The sum of \$192,117 was from the Colorado mines; the rest from Idaho, New Mexico and Wyoming.

The reported discovery of gold at Alpine Station, on the Southern Pacific Railroad, north of Los Angeles, is creating much excitement.

There are now only two men in Meadow Lake mining district, Nevada Co., all others having come out for the winter.

## Clays.

The different varieties of clay found in the United States play quite an important part in our industrial interests, owing to the magnitude of the industries connected with them. In this State, in addition to the clays used in making common brick, there is an abundance suited for making the various kinds of pottery. Porcelain clay has also been found, but not utilized. The useful clays of varying degrees of excellence are known to exist in considerable abundance at the following localities in California, their presence having also been observed at many other places: At Lincoln, Placer Co.; Antioch, Contra Costa Co.; in the vicinity of San Francisco, Oakland, San Jose and Sacramento cities; near Mokelumne Hill, Calaveras county; Calico, San Bernardino county; and at various places in Humboldt, Mendocino, Napa, Sonoma, Tehama, El Dorado, Inyo, Santa Barbara and Los Angeles counties.

We make plenty of the coarser kinds of crockery, tiles, sewerage pipes, etc., but no tableware. We make in California about 250,000,000 bricks annually. There is probably \$1,000,000 invested in the brick-making business in the State. In our potteries a capital of about \$400,000 is employed, and the aggregate yearly value of products is \$375,000.

As showing the value of clay deposits, the following list of articles manufactured from clay in the United States is given:

Building Materials—Common building brick; front building brick (pressed brick, molded in taglio or ornamental brick); hollow brick; glazed brick; roofing tile; flue linings; door-knobs and hardware porcelain; terra-cotta lumber; hollow tile, fire-proofing or castings.

Refractory Materials—Fire-brick; gas retorts; retorts for zinc works and for other metallurgical purposes; glass pots; stove and furnace linings; chemists' and assayers' materials.

Pottery—Stoneware; earthenware (yellow ware, Rockingham ware); granite or ironstone ware; whiteware; porcelain (as part of mixture).

Ornamental Ware—Encaustic tile, for walls or floors; ornamental pottery; ornamental terra cotta.

Miscellaneous—Sewer pipe; drain pipe or drain tile; flower-pots; garden border edging; telegraph insulators; well-tubing; receivers for acids; water filters and coolers; lampstands.

This classification is, of course, arbitrary, for a single article might properly come under two or more of these heads. The catalogue is not complete, but includes all lines of manufacture of any great importance. People who have deposits of clay on their lands should examine them so as to ascertain their value. If the deposit is of any extent, analyses can be made of the material, so that the possibility of its utilization in any particular branch may be determined.

THE PHOTOGRAPHING PROCESS.—The San Francisco Photograving Co., No. 659 Clay street, has issued a handsome "proof-sheet" showing engravings made by their process. Machinery, animals, maps, portraits, etc., are readily represented by this system at a much less cost than woodcuts. Their specialties comprise views of buildings, scenery, curiosities, plants, flowers, paintings; mineral, geological, and other natural specimens; samples of crockery, gas-fixtures, and fancy goods; machinery, implements, new inventions, mathematical and scientific instruments, etc., for trade purposes. Enlarged or reduced facsimiles are readily made. The finished cut made by the photo-engraving process may be used for circulars, newspapers, books, etc., and may be readily duplicated. The cuts shown in the proof-sheet show what good work can be done. Copies will be sent on application, and those desirous of procuring engravings without great expense will do well to examine these samples before ordering cuts on wood.

THE Great Western Quicksilver mine, situated on the line of Sonoma and Lake counties, struck quite a bonanza on Thursday last, 90 flasks of quicksilver being turned out from the retorts in a few days.

THE principal business buildings of Quincy, Plumas county, were destroyed by fire on the 25th inst.

CONCENTRATING WORKS, consisting of long tailings sluices, are to be put up at Camp creek, Idaho.

## Hydraulic Mines not all Shut Down.

A New Field for this Industry Opening in the North.

We observe that some portions of the press abroad, remarking upon the subject of hydraulic mining in California, speak as if they supposed this class of mines had all been closed by legal process. As many people, even in this State, appear to be laboring under a like impression, we deem it important that these mistaken notions should be corrected, inasmuch as we have here a great extent of hydraulic deposits the working of which has not been prohibited by the courts, nor is it ever likely to be. The only mines of this class on which operations have been stopped are those that discharge their tailings into some one of the numerous confluent of the Sacramento or the San Joaquin river. This includes, it is true, the largest and most productive hydraulic mines in the State, being those located along the main gold belt and extending from Tuolumne county north to Plumas. South of Tuolumne county the hydraulic gravel deposits, though in places quite rich, are not extensive nor have they ever been outfitted or worked on a large scale. In the range of mining counties, however, reaching a hundred miles or more to the north, occur many very extensive and valuable beds of hydraulic material, this being the region of the deep banks and the "Dead Rivers" proper. Throughout all this territory hydraulic washing has been restrained, though the miners are not without hopes that, through some modification of the restraining orders, through the more effectual impounding of the mining debris, the employment of hydraulic elevators, and perhaps other equally effective contrivances, they will yet be permitted to resume washing operations, at least in part; nor do they wholly despair of obtaining some relief through the action of Congress and the State Legislature. However this may be, certain it is hydraulic mining is for the present repressed in what were formerly the most important and largely productive localities in California.

Meantime this branch of mining has been gradually extending in the northwestern counties of the State, where the business has not as yet been embargoed, and where, as above remarked, there is no likelihood that it ever will be. In these counties, which consist of Trinity, Humboldt, Siskiyou and Del Norte, there occur along the principal rivers and their tributaries, vast ranges of auriferous gravel under the most favorable conditions for their being successfully handled by the hydraulic process. Though worked in spots and in a limited way for many years, not until recently have these northern mines come into much notoriety. With the interdiction of hydraulic piping further south, this region began to attract additional notice, and it is just now receiving a good deal of attention from mine investors or their agents.

The Klamath, Trinity, Smith and Salmon rivers and their branches constitute the streams along which these auriferous gravel banks are mainly found. While the "Dead Rivers" of the Pliocene epoch are not here present, or at least not so well marked as in Sierra, Butte, Yuba, Nevada, Placer or Tuolumne counties, this same class of deposits exists, but of a later period, carrying usually one or more extremely rich channels, while the entire bed of gravel here is more apt to be auriferous throughout than in the counties last mentioned. Not only so, but there is here an almost entire absence of that indurated material so often met with in the old Pliocene channels, and which it costs so much to disintegrate; nor does the miner in this section encounter any volcanic or other barren matter overlying his claim, often so hard and in such quantity as to prevent its being worked. Water is more abundant in this region than in any other part of the State, short and inexpensive ditches sufficing, as a general thing, to introduce it upon the mines under any needed amount of pressure. The outlet is almost everywhere ample, the most of the mines being situated well above the streams into which they discharge.

Nearly the whole of this country is drained by the Klamath river and its three principal branches, the Trinity, Scott and the Salmon, all of which have numerous confluent, the main Klamath having also many minor tributaries. These various streams are separated by high ridges or by lofty mountains, the latter

carrying on their northerly slopes heavy bodies of snow throughout the year. Hence the copious supply and the long continuance of the water season, few of the streams ever drying up, and the larger being kept at a high stage until late in the summer. Without storage of water most of the hydraulic miners here have enough to continue piping from 8 to 10 months in the year. Through recourse to reservoirs the majority of them might run their claims the year round, there never being enough snow or ice here to seriously interfere with washing operations.

None of the rivers in this northwestern angle of the State are navigable, nor are there any bays, harbors or even estuaries suitable for giving shelter to shipping at their mouths. They run swiftly over rocky beds and debouch directly into the ocean. Such being the case, no amount of sediment sent down them, whether from the mines or otherwise, can do any harm. What little farming land there is along these streams lies, for the most part, above high water. And were it otherwise, the owners and cultivators of these little strips of land would be the last to ask for a closing down of the hydraulic mines, since these alone afford them a market for what they raise. As there can, under these conditions, be no interest, property or calling liable to be injured by the debris discharged from the hydraulic mines, it is not to be expected that any objection will ever be made to this branch of mining in that section of the State.

Satisfied of this, and influenced by the generally favorable conditions that exist there, we are advised that a number of sales of mining properties have lately been made in that region, negotiations for others being in progress. These purchases, made partly on San Francisco and partly on foreign account, were conducted so quietly that not until recently did the fact of their having been consummated reach the ear of the public. At Happy camp, on the Klamath, a hydraulic property sold two years ago to Eastern parties has since reimbursed its owners their entire outlay out of its net earnings, amounting now to about \$60,000 per annum. Three San Francisco parties own a hydraulic mine on Hurdy-Gurdy creek, a branch of Smith river, Del Norte county, and which they have for some time past been running with great success, and yet we must confess that only quite lately did we for the first time hear of the enterprise.

Obviously, there is going to be opened in the country here spoken of a wide field for hydraulic mining, and one in which the business will be carried on with better average results perhaps than in the older districts, since the mines here can not only be outfitted, but afterward operated at much less cost than there. It will be a long time before hydraulic mining becomes wholly an extinct industry in California.

THE STRONGEST WOOD IN AMERICA, according to Professor Sargent, is that of the hickory of the Arkansas region, and the weakest the West Indian birch (*bur seva*). The most elastic is the tamarack, the white or shell-bark hickory standing far below it. The least elastic, and the lowest in specific gravity, is the wood of the *Ficus aurea*. The highest specific gravity, upon which in general depends value as fuel, is attained by the bluewood of Texas.

THE CONGO COUNTRY. — Notwithstanding the glowing accounts which have been published in regard to the splendid opportunities for business, for Europeans, which are presented in the newly-discovered Congo country, Africa, M. de Brazza, the explorer, says that after nine years' experience he has come to the conclusion that the West African territory and the basin of the Congo must be left to be developed by the original inhabitants.

ATTENTION is called to the advertisement in another column of W. A. Goodyear, for many years connected with the California State Geological Survey, and latterly Government Geologist of Salvador. Mr. Goodyear has returned to this coast, intending to settle here again.

THE El Paso Times declares that the "boom" is still booming at Kingston, New Mexico, and that the rich developments and influx of capital there indicate an era of prosperity for that camp.

### Pike's Improved Gold Sluice.

The accompanying illustration shows two sections of Pike's improved sluice for saving fine gold usually lost in mills and placers and the floured quicksilver and amalgam which escapes from silver mills. The sluice is simple in construction, one fixed box, about two feet long, being inserted every six feet in an ordinary tailings sluice. The width of the boxes is such as to carry a moderately fast sluice current about one inch in depth. For silver mills, where the settler discharge is irregular, the boxes should be made two feet wide. The depth of the fixed box at the upper end is about three inches; at the lower end, an inch or an inch and a half. The general pitch or set of the boxes is about an inch to the foot. The bottom of the fixed box is covered with an amalgamated plate, or a thin bath of quicksilver, and over this is another amalgamated

PIKE'S IMPROVED GOLD SLUICE.

plate, about one-half of which is perforated by one-eighth inch holes. An oval-shaped riffle three inches high is placed before the upper perforated plate, another riffle half that height is placed across the center, and still another small one may be placed near the end. Thus the tailings passing through the box receive the regular riffle action and are thrown back on the amalgamated plate, are carried through the

saving of \$6 in 12 hours, without any electrical attachment. Edward Pike, Salt Lake City, Utah, is the patentee.

### The Black Copper Group.

A very interesting series of mining claims in Arizona is shown in Figures 1 and 2, and described by Mr. Wendt in the paper quoted from on the first page of the Press last week. They are known as the Black Copper group, consisting of the Copper Queen, Black Copper, Little Big Bonanza, Gray Copper and Copper Jack claims, all located end to end. They occur in a belt of gneiss rock, cut by a dyke of diorite, occasionally intersected by a subsequent intrusion of trachyte.

The gneiss rock for a width of some 40 feet is cut by innumerable small veins and strings of copper ore, following generally the strike of the gneiss and dipping, a little faster than that

Fig. 1.—PLAN OF BLACK COPPER GROUP, ARIZONA.

Fig. 2.—SECTION OF GROUP AT RIGHT ANGLES TO DIORITE DYKE.

perforations, and another chance for amalgamation is afforded on the plate or quicksilver below before they are carried into the main box again.

The application of electricity to the first section is shown in the engraving, the positive and negative wires being attached to the upper and lower plates respectively. The electric current is completed by the sluice stream which falls between the two plates. By the use of a powerful electric current, which may be furnished from a strong galvanic battery, or preferably from a small plating dynamo, the quicksilver is kept bright and lively, flouzing and sickening is to a great extent prevented, and the finest particles of gold are readily absorbed. The electro-amalgamation in this box is certainly the most simple yet brought into practical use, and the results on free gold are represented to be all that can be desired.

The second section is shown without the electric attachment, and shows a method of obviating any "filling up" when the gangue may be very heavy. This is done by placing a wedge-shaped block at the bottom of the fixed box, as shown in the cut. The cost of construction of this amalgamator is little more than the ordinary sluice, and the Murray (Idaho) Sun mentions one experiment there at the end of a common riffle which showed up a

tion of affairs. The ore in the shaft and on the surface is malachite and chrysocolla. The widest of the seams is only two inches; the whole mass forms a *stockwerk* too poor to pay for working. Down the hill from this system of veins or *stockwerk*, and below the diorite dyke, a vein of ore is found lying almost horizontally in the drift. Analyses prove it to be a typical chrysocolla. This bed of ore is undoubtedly of secondary origin, and derive from the veins up the hill near the diorite. It has been stripped of a number of places, and has been found, by cuts sunk through it, to have a thickness of four feet of pure chrysocolla. The occurrence is remarkable, as showing the formation of a bed of copper ore in very recent times, and in the wash. Some of the ore from one of these blanket deposits has been hauled to the Old Dominion smelter; but its characteristic decrepitation when heated has prevented its use in the blast furnace. The ore will have to be calcined and made into adobes before it can thus be used.

The making of adobes from fine ore, Mr. Wendt remarks, is generally carried out in all the copper districts of the Southwest. The fine ore is either simply put through a pug-mill, with 10 per cent of clay, or it is pressed into cakes in a regular brick machine, air-dried and smelted.

### Mineral Products of the United States.

The value of the mineral products of the United States is increasing annually. The statistics of last year show an increase in value over previous year of \$15,306,616. In 1885 our mineral products were valued at \$428,521,356; in 1884 the value was \$413,214,728. These products, both metallic and non-metallic, comprise a great many substances, and include gold, silver, copper, lead, zinc, coal, petroleum, lime and many other things, all of which are of commercial value. We have many things on this coast not mined elsewhere, and we have many things also which are not yet mined which elsewhere are found profitable to work. California is the largest gold-producer in the United States. It is the only producer of quicksilver, and, with the exception of Nevada, the only producer of borax. Of chrome iron, too, California is the only producer.

It is interesting to note the number of substances of mineral nature now produced in the United States. We append a table from the advance sheets of the third volume of "Mineral Resources of the U. S.," shortly to be issued by the U. S. Geological Survey. It gives the amount of production and the value of the mineral products of the United States in 1885:

METALLIC PRODUCTS IN 1885.		
	Quantity.	Value.
Pig-iron, spot value...long tons	4,044,525	\$64,712,400
Silver, coining value...troy ozs.	39,910,279	51,600,000
Gold, coining value...troy ozs.	1,538,376	31,801,000
Copper, value at N. Y....lbs	170,962,607	18,292,999
Lead, value at N. Y....short tons	129,412	10,469,431
Zinc, value at N. Y....short tons	40,688	3,539,856
Quicksilver, value at S. F. flasks	32,073	979,189
Nickel, value at Philadel'a.lbs.	277,904	191,753
Aluminum, value at " troy ozs.	3,400	2,550
Platinum, value, crude, at N. Y....troy ozs.	250	187
Total.....		\$181,589,365

\*Including copper from imported pyrites.

NON-METALLIC MINERAL PRODUCTS IN 1885 (spot values).

Grand total.....	\$428,521,356

A WRITER in the *Southern Cultivator* says: It is now being declared that the willow is quite as useful for malaria districts as the blue gum, and even more so, and well deserving the name of the anti-fever tree. The malarious shores of the Levant, from which fevers and agues are never absent, have been rendered perfectly healthy by the extensive planting of willow trees.

THE U. S. Mint, at Carson, is again open for business as far as the assay, melting and refining departments are concerned. The coining department will probably start up when bullion deposits are sufficiently large.

THE Santa Rita Land and Mining Company purpose to work the San Xavier mine, Arizona. The lease of Mr. Conlee having expired, the company will continue the work, but probably on a larger scale.

THE Young America Consolidated Mining Company, of Sierra county, paid a dividend of four cents per share, or \$30,000, on the 9th of September, making \$145,000 this year.

## MECHANICAL PROGRESS.

## New Process of Manufacturing Seamless Copper Tubes.

The English correspondent of the *American Manufacturer*, in one of his late letters, says: A new process in tube manufacture which promises to be of much value from an economical and mechanical point of view has recently been introduced into the works of Messrs. Ralph Heaton & Sons, of Birmingham, Eng., for the manufacture of seamless copper tubes. The principle employed is one by which the friction of bodies in contact, which are being moved over each other in one direction, can be greatly reduced. As it is applied to tube mandrils the resistance to a bulb mandril being passed straight forward through a tube can be reduced to about one-sixtieth by revolving it. Most saving in power seems to be effected when the cross motion is about equal to the longitudinal traverse.

## Description of the New Manufacture.

Described briefly, the process is as follows: Round bars or "billets" of metal are fixed firmly in a matrix. The "billet" is then pierced to the required diameter by the mandril, which revolves, and is pressed forward with great force. This is accomplished without taking any metal out of the "billet," the metal being laved or spun aside by the mandril, as it forces its way through. This necessarily elongates the metal, and at one thrust a billet 2 feet 3 inches long is transformed into a "shell tube" four feet long. In this state the shell may be taken to the ordinary draw benches, and finished into tubes of required diameter.

## In the Making of Iron and Steel Welded Tubes

The process has already been in use for a considerable period in several of the large tube manufacturing in this country, but its application to copper tubes is entirely new. The inventor is Mr. J. Robertson, of Glasgow, who claims for it considerable advantages over the processes previously in use. The result of the application of the invention to the making of cold-drawn tubes is that they can be made at less cost than by any mode of casting them.

**A NEW PROCESS OF WELDING.**—Mr. William Anderson, of Erith, recently read a short paper on "The Lafitte Process of Welding Metals" before the British Association. With a view to overcome the difficulties in spreading borax or other fluxing materials over the heated surfaces in making welds, M. Lafitte had invented plates, usually consisting of a very pliable wire gauze, on both sides of which the flux, being highly vitrified, is evenly spread. Paper may be also used as a support. In cases of small surfaces it is often sufficient to form a sheet of the flux and metal filings agglomerated together. The plates are simply placed between the surfaces in place of the powder being sprinkled on, the wire gauze being welded in between the surfaces. A table of tests made was shown on the wall, the results being highly favorable to the system. Mr. Anderson attributed a great part of the success to the much lower temperature at which the welding could be accomplished. Examples of welding by this system were also shown, all of great interest; perhaps the most remarkable was the case of a hammer-head in which a face of tool steel had been welded on to an ordinary hammer-head forging. This hammer had been in ordinary shop use for six months. To weld tool steel to iron is certainly a remarkable achievement, and one that marks an era in the history of the blacksmith's handicraft.

**INFLUENCE OF COLD AND STRAINS ON IRON AND STEEL.**—B. Papkoff gives in the *Russian Mining Journal* an account of an extensive series of experiments on the influence of cold on the strength of iron and steel in various forms and under various kinds of strains, but circumstances obliged him to abandon his intentions after a very few tests had been made. He thinks, however, that the results he was able to obtain are worth being made known, because they seem to point to conclusions totally opposed to those generally received. All the specimens tested were taken from soft steel and iron plates, three samples being cut from each plate. One sample of each group was tested at the ordinary and two at the low temperature. It was found that both the ultimate strength and percentage of elongation increased very sensibly with the decrease of temperature; the author remarks that such a result was to be expected, because the contraction caused by cooling has the effect of bringing the particles of matter closer together, and consequently of intensifying the force of cohesion, but he also observes that a law which may be found general for strains gradually imposed may not apply at all when they assume the nature of shock or of impact.

**A VALUABLE INVENTION.**—Henry Loeser, of Boston, has invented and patented a machine for cutting leather lacings by machinery. Until this invention was brought out leather lacings for shoes, beltings, horse-nettings and the like have been cut by hand, of necessity a slow process, and when the millions of these little necessities annually consumed is taken into account, it will be seen that the work required altogether a very large number of hands. A company has already been formed for operating

these machines, which are said to be producing astonishing results, promising to revolutionize entirely the business heretofore prosecuted by hand. Not only does one of these appliances turn out about 10 times as many lacings as a man could do, and at half the cost, but it utilizes the merest bits of leather, chopping little shreds, almost worthless, into the most perfect laces, turning them out of uniform length and exact proportions. The shavings remaining are manufactured into shoe heels. Already 26 hands are engaged in working the machines thus far put in operation, and there is an unlimited demand for the goods.

**COMPRESSED WOOD FOR TOOTH GEARING AND SHUTTLES.**—The *London Engineer* describes the compression of beech and other woods by means of hydraulic presses, under the patent of Robert Pickles, of Bromley, England, who makes this wood a specialty for shuttles and for gearing. The compression of the wood improves its wear-resisting qualities to a degree that would be deemed impossible. The wood is first sawn into sizes necessary for making shuttles or cogs and naturally dried. It is then put under a pressure of about 15 tons per square inch, in a rectangular space in the press, holding six shuttle blocks, three side by side and two deep. Above is a metal block made so as to fit the space in the ram. The depth of the blocks before compression is 2½ inches, which is reduced to 1½ inches. The woods generally used for this purpose are beech, cornel and persimmon. The grain is very close and the weight of compressed beech is considerably greater than that of boxwood, and when compared with uncompressed beech, it is remarkably heavier. In regard to the wear of the wood for cogs it is stated that it will last a long time, and run very easily.

**THE WIRE AGE.**—We have had the stone age, the bronze age, the iron age, and it is likely the future annalist will describe this period of American history as the wire age. In no part of the economy of daily life are we separated from wire. Sleeping, we repose on wire mattresses. Eating, we see foods that have passed through sieves, and which are sheltered from the flies by wire-covers. Calling, we pull wires to ring curled-wire gongs. Traveling, we are conveyed by cable or electric railways, hoisted by elevators hung on wires and hurried over wire bridges. We announce our coming by telegraph or telephone wires, we talk by wires, and we thread our way by night through streets lighted by means of electric wires. Across the prairies of the west are stretched thousands of miles of barbed wire fences, against which dumb brutes protest, cowboys swear and draw the knife, and lawyers, judges and reporters whet their intellectual blades. Our clocks are set by wires, our watches run by wires, our books are stitched with wires, our pictures hung on wires, and our politics managed by wire-pullers.

**LOCOMOTIVE IMPROVEMENTS.**—Precisely what form the locomotive of the future will take it would be unwise to predict, but there are many evidences that the largest locomotives have nearly or quite reached the limits of size and capacity possible with the present plans of construction. In this connection it may be stated that a novel and ingenious device for ejecting water from the cylinder of a locomotive has recently been invented by William McKenzie, general foreman of the New York, Pennsylvania & Ohio Railroad machine shop, in Meadville. The steam ports on either side of the locomotive are connected with a small pipe, to which is attached an automatic valve directly back of the saddle. When the locomotive is under steam pressure this valve remains closed, and opens the moment the pressure is shut off, thus allowing every drop of water that has accumulated in the ports to escape.

**STEEL DIRECT FROM THE ORE.**—Considerable interest is awakened in experiments now proceeding in Pittsburg, which seem to prove that excellent steel can be made directly from iron ore, by mixing in small pieces with 20 per cent of Rhode Island graphite, reduced in an ordinary heating furnace to a spongy mass; the phosphorus and other impurities flowing off with the slag, and the mass being ready to be drawn in two hours. Specimens have been hammered into knife blades, developing fine qualities. —*Pittsburg Times*.

**A NEW FORM OF SCREW-DRIVER** has been devised, which by simply pushing on the handle revolves and readily drives home any small screw. In drawing a screw the device is so "set" that the tool may be used as an ordinary screw-driver—the same in all heavy work. It will be seen that the use of this tool does away with much of the tiresome turning of the hand and twisting of the wrist, the work of driving the screw being accomplished by simply pushing.

AMERICA now makes one-fifth of the iron and one-fourth of the steel of the world and is second only to Great Britain. In steel, America will probably lead the world in 1890. We already lead the world in Bessemer steel. In 1870, we made only 40,000 tons. In 1882 we made 1,500,000 tons. —*Power and Transmission (Mishawaka, Ind.)*

THERE are about 690 iron furnaces in the United States. These turned out, in 1885, over 5,000,000 tons of pig iron.

## SCIENTIFIC PROGRESS.

## First Appearance of the Grasses.

At the meeting of the Geologists' Association, held at London, April 2, 1886, J. Starkie Gardner discussed the points bearing on the geological period at which grasses first began to assume a preponderating position in vegetation. Their value and importance at the present day were first sketched, and it was remarked that they occupy, under cultivation, one-third of the entire area of Europe, inclusive of lakes and mountains. There are over 3000 species fitted to occupy most diverse stations and to overcome nearly every kind of competition, under no matter what conditions, with the result that about 95 per cent of the plants growing in ordinary meadow land are grasses.

The conclusion arrived at was that there was no great development of grasses until toward the close of the Eocene, no definite remains being associated with any of the older Eocene floras of temperate latitudes. A number of facts were brought forth to show that grasses could by no possibility have failed to become associated with the remains of other plants in beds deposited under such conditions as those of the Eocene, had they existed in any profusion then; while, further to support this argument, it was stated that the very similar Oligocene and Miocene beds all over Europe are crowded with them. Further, it was shown that the dentition of all the early Eocene herbivora was adapted for crushing fruits, snapping twigs, and grubbing roots, rather than for browsing on such food as grass; so that the evolution of true graminivora must be postdated to the appearance of the grass itself.

## The Geological History of Insects.

At the same meeting, the geological history of the whole class of insects was reviewed, with the object of supporting the conclusion arrived at as to the post mid-Eocene date of grass. Older remains of grass may, however, occur in the last series of Tertiary deposits in Spitzbergen, but as yet their age has not been accurately correlated. Finally, it was shown that the introduction of an aggressive type in vast numbers, of different habits, to pre-existing vegetation, exerted an influence upon terrestrial life altogether without parallel, and for the first time rendered possible the development of a meadow and prairie vegetation distinct from that of marsh, scrub, and forest, with all the attendant forms of animal and vegetable life to which such vegetation is indispensable.

**INFLUENCE OF MAGNETISM ON CHEMICAL REACTION.**—Mr. E. L. Nichols, in the *Journal of the Chemical Society*, describes a set of experiments with aqua regia, nitric acid, hydrochloric acid and sulphuric acid to illustrate the phenomenon that when finely divided iron is placed in a magnetic field of considerable intensity and exposed to the action of the acid, the chemical reaction differs in several respects from that which occurs under ordinary circumstances. With aqua regia, it was found that the speed of reaction is greater in the magnetic field than without, and that the heat of chemical union is much greater. With nitric acid, the effect of the magnet was to greatly increase the speed, reducing the average time from eight minutes to less than one minute. With sulphuric acid, the reaction was uniform and complete, and apparently of the same chemical character within and without the fluid. The magnet was found, however, to increase the speed of reaction and to decrease the amount of heat produced. A series of measurements was made with nitric acid, in which powdered copper was substituted for iron. The reaction in the field was found to be identical with that which occurred when the magnet was not in action.

**NEW USES FOR POTATOES.**—Two new uses for potatoes have recently been discovered, one of which is for the production of sugar, the other for the production of alcohol. A Lyons sugar manufacturer has devised a process whereby the potato is treated in much the same manner as the sugar beet. Hitherto only glucose has been extracted from the potato, but it appears that, by means of the electric current, not only glucose, but also saccharose, may be obtained therefrom. Satisfactory results having been obtained from trials made in the Azores, on the failure of the orange crop, to utilize sweet potatoes for the production of flour and spirit, a French chemist, connected with the French Antilles, M. Ralu, has lately taken out patents for improvements in these two new industries. The latter seems likely to obtain large proportions. The sweet potato of Martinique yields 15 litres of alcohol at 100 degrees per 100 kilos weight of roots, and it is probable that the produce of other islands and of the Southern continent of America will yield about the same quantity. Ordinary potatoes only yield about 3 to 4 litres.

**IMPORTANT DISCOVERY IN GLASS.**—Berlin papers copy from the *Germania* an account of an important discovery in glass manufacture made by Friedrich Siemens, of Dresden. He has succeeded in casting glass in the same way as metal is cast, and obtaining an article corresponding to cast metal. This cast glass is hard, not dearer in production than cast iron, and has the advantage of transparency, so that all flaws can be detected before it is applied to practical use. It will be much less exposed

to injury from atmospheric influences than iron. The process of production is not difficult, the chief feature being rapid cooling. Experiments are being just now carried out at the Siemens glass foundry, at Dresden, with the purpose of ascertaining to what industrial uses the new material can be applied. Its hardness and resistance are so great that it is thought possible it may be used as a substitute for iron in the manufacture of rails for railroad use. Experiments are now being made in that direction.

**SCIENTIFIC POETRY.**—The natural rate of respiration is from 16 to 24 breaths per minute, the average being 20; and Dr. Oliver Wendell Holmes has explained the popularity of the eight-syllable verse by the fact that it follows the natural rhythm of respiration more exactly than any other. Experiments with the poetry of Scott, Longfellow and Tennyson show that an average of 20 lines will be read in a minute, so that one respiration will suffice for each line. The articulation is so easy, in fact, that it is liable to run into a sing-song. The 12-syllable line, on the other hand, as in Drayton's "Polyolbion," is pronounced almost intolerable on account of its unphysiological construction. From this it follows that, while the poets disregard science in many ways with impunity, nothing in poetry nor in vocal music is likely to win favor that is not calculated with strict reference to the respiratory functions.

**A CURIOUS SORT OF BAROMETER.**—A scientific journal speaks of a curious sort of barometer in use in the canton of Geneva, Switzerland, where some dried-up wells are employed by the natives to forecast the weather probabilities. These wells are tightly closed at the top by means of a cover, in the center of which an orifice, about an inch in diameter, is made. When the air pressure outside diminishes, on the approach of a storm, the air in the well escapes, blows a whistle in connection with the orifice, and in this way gives notice of the storm's approach. If, on the contrary, the pressure increases, a different sound is produced by the entry of the air into the well, and the probability of fine weather is announced.

**A WICK FOR GASLIGHT.**—We have already made reference to the introduction of a new invention which, it is claimed by gas engineers, will revolutionize the present system of gas lighting. It is the invention of Dr. Auer, of the chemical laboratory of the Vienna University. Briefly described, the invention may be said to consist in rendering a cottonwick incombustible by impregnating it with a metallic liquid. Thus treated, the wick, instead of burning, merely glows, emitting a radiance not unlike that of the electric light. The whole process is very simple, and the great advantage of the invention is that it may be applied to any gas-burner.

**ELECTRIFIED BUBBLES.**—At the Royal College of Greenwich, England, soap bubbles were blown of a cylindrical form and in a vertical position between two concentric platinum rings which served as electrodes. When the bubbles are left to themselves they exhibit a series of colors in horizontal band, which gradually enlarge and descend; a black band soon appears toward the top and also extends downward. Electric currents tend to transport the liquid to the negative pole, thus retarding the motion of the bands if the negative electrode is at the top, and accelerating it if the negative electrode is at the bottom.

**A NEW METAL.**—A new metal, called by the inventor, Albert Assman, of Rahway, N. J., "assayme," is produced by a special treatment of tin. It has all the good qualities of the latter, can be pressed into any shape, or cast into statuary, or used for plateware of any description. A beautiful bronze color can be given to the metal, or any shade from bronze to a silver color; and as it does not in the least corrode, it is especially valuable as a silver solder. It melts at a temperature of 432 degrees, or 18 degrees less than tin.

**THE SWIFTEST BIRD** on the wing is the frigate bird, a sort of nautical bird of prey. Sailors believe that it can start with the peep of dawn from the coast of Africa, and, following the trade winds, land on the American coast before sunset. It can undoubtedly fly more than 200 miles an hour, but we do not know of any trustworthy record of the speed of which it is capable.

**ORIGIN OF DEW.**—It is common to hear people speak of dew falling; it does not fall—it rises, as one might say. Dew forms on vegetation precisely as the moisture forms on the surface of an ice-pitcher in a warm room. Dew is the deposition of moisture in the atmosphere on the cooler surface of the earth.

**WIND PRESSURE** is generally supposed to increase as the square of the velocity when the opposing surface is at right angles to the direction of the wind, and in such cases Smeaton's rule is to divide the square of the velocity in miles per hour by 200; the quotient is the pressure in pounds per square foot.

**WONDERFUL PROGRESS** is being made in microscopical science, the president of the British Microscopical Society recently pointing out that results are now attained which mathematicians five years ago declared to be impossible.

## ENGINEERING NOTES.

## An Immense Drainage Enterprise.

The Russian Government is engaged in one of the most extensive drainage enterprises ever undertaken in any portion of the world. The location is what is known as the Pinsk marshes, in the southwest of Russia, near the borders of Galicia. This region is so extensive as to secure special designation on the ordinary map of Europe, and, in point of area, is very much larger than Ireland. They have become famous in Russian history as a refuge of all manner of romantic characters, and have remained an irreclaimable wilderness up to within the last few years. In 1870 the Russian Government first took in hand seriously the abolition of this wild expanse, owing to being perpetually more or less submerged and covered with a jungle growth of forest, preventing not only communication between the Russian districts on either side, but also between Russia and Austro-Germany. A large staff of engineering officers and several thousand troops were draughted into the region, and these have been engaged upon the undertaking since. Up to the present time about 4,000,000 acres have been reclaimed by means of the construction of several thousand miles of ditches and of canals so broad as to be navigable for barges of several hundred tons burden. Just now the engineers are drawing up the program for next year, which comprises the drainage of 350,000 acres by means of the construction of 120 miles more of ditches and canals. Of the 4,000,000 acres already reclaimed, 600,000 acres consisted of sheer bog, which has been converted into good meadow land; 900,000 acres of "forest tangle," which have been prepared for timber purposes by cutting down the underwood and thinning the trees; 500,000 acres of good forest land—forest oases in the midst of the marshes—hitherto inaccessible, but which have been connected more or less by navigable canals, and thereby with the distant markets; and finally 2,000,000 acres have been thrown open to cultivation, 120,000 acres of which have already been actually occupied. Besides making the canals and ditches, the engineers have built 179 bridges, bored 577 wells from 20 to 80 feet deep, and have made a survey of 20,000 square miles of country hitherto unmapped. When their task is finished, Russia will have effaced from the map of Europe one of the oldest and toughest bits of savage nature on the continent. From an engineering, geological and scientific point of view, generally, the work is one of special interest.

**DRAINAGE OF THE CITY OF MEXICO.**—The City of Mexico, though several thousand feet above sea level, is flat and hemmed in by mountains and a shallow lake, which latter has received all its sewage up to this time. The lake is filthy and is rapidly filling up, and on several occasions of late has threatened to overflow the city. Efforts have been made for several years to secure a proper drainage for this sheet of water, and various engineers have been consulted in the matter. Works are now being constructed under the direction of Robert S. Mayol, engineer of the City of Mexico. The sewage and surplus waters of the lake will be conveyed in a canal 30 miles to a tunnel, which is now being pierced six miles through the base of a mountain, the ground on the other side being much lower than the city. The whole cost will be \$6,000,000. The city is supplied with an abundance of pure water by means of those aqueducts which conduct the water from the mountains.

**ANOTHER GREAT RAILROAD ENTERPRISE.**—The grand scheme of a railroad from the ocean, at Charleston, to the Lakes, is once more talked of. Perhaps the best assurance of the good faith of the projectors of this important railway enterprise is contained in the fact that Col. Frank Coxe, now a resident of North Carolina, has been elected president of the company. Col. Coxe possesses large business capacity, owns valuable landed and coal interests in North Carolina and Pennsylvania, was formerly the successful president of the Commercial Bank, of Charlotte, N. C., is a member of the wealthy firm of Coxe Brothers & Co., extensive coal miners in Pennsylvania, and is now the vice-president of the Western North Carolina Railroad.

**THE INTERNATIONAL YACHT CONTROVERSY.**—A veteran naval officer suggests that the relative merits of the sloop and cutter type will not be settled until one of our sloops conquers in English waters. He says the performances of cutters in the rough seas and thrashing winds of the British channel and narrow seas are really wonderful, and confirm him in the belief that they are the best rough-weather boats he has ever seen in nearly 40 years' service in all quarters of the globe.

**AN IMMENSE SPAN.**—The Sakkur bridge, now being constructed in India, by an English firm of bridge builders, consists of a single span of 790 feet between abutments, 173 feet to top of bridge timbers. It is constructed on the cantilever principle, and spans the river Indus at the Sakkur. It is 100 feet wide, and is designed for both a railway and for common travel.

The Napa county quicksilver mines sent down 349 flasks in September.

## USEFUL INFORMATION.

## How to Judge Canned Goods.

A hint now about tinned goods, meat especially. Note, when about to purchase, the condition of the tin; if bulged outward, don't have it, even as a gift! We will explain the process of canning to give weight to our warning.

The meat is packed in tins while raw, then sealed and cooked in an outer vessel of boiling water, with sometimes the addition of a chemical to raise the temperature. When cooked, the can is pierced, and, as soon as the air and steam have been expelled, it is soldered. Experts know when it is ready for soldering; a moment too soon, and the mischief is done, because if the air is left in, the tin bulges, and the meat will not be good. On the contrary, if the tin has sunk, it is an infallible sign of goodness; it proves a vacuum, which is natural, as the meat shrinks when no air is left in the tin.

Some may say, what matter if air be left in the tin? Simply this: Nitrogen, an element of air, imparts to bodies with which it comes in contact a tendency to change and decay.

Often on opening a tin of preserved goods, people are heard to say, "the air is escaping," instead of which, the slight hissing sound is the result of the air rushing in, another proof that there was a vacuum. Well, we go so far as to say that, assuming the outward sign of goodness above referred to; a label bearing the name of a good exporter or importer, and also a reliable venter of the article, whether meat, fish, milk, soup or vegetable, the chances are a million to one against any being injured, much less poisoned, by tinned goods.

Another caution, though: Always look out for any little globules of solder that sometimes find their way inside the tin; and take care, especially in the case of salmon and lobster, to empty the contents as soon as opened into an earthenware vessel. This is necessary for everything except milk.—*Cassell's Magazine.*

**HOW TO LAY A TIN ROOF.**—I notice by communications in your valuable paper that a diversity of opinion exists in regard to how a flat seam tin roof should be laid. The only substantial way, I think, is never to use tin larger than 14x20, and clip the corners sufficiently so that the tin will look on well. Turn an edge three-eighths of an inch and commence at the eave so that the water will run over the seams. Use tin nails with large heads, and hammer down well and smoothly, using five nails to the sheet. Use dilute muriatic acid, and solder well with half-and-half solder—never poorer. If the roof has over 4 inches fall to 10 feet, never lay it down flat, but always with a standing seam. When the pitch is less than 4 inches in 10 feet, lay down a flat seam. I believe all my brother tanners will agree with me.—*American Artisan.*

**A NOVEL CONTRIVANCE TO LOOSEN KEYS AND WEDGES.**—An Eastport engineer has been in the habit of using a novel contrivance to loosen keys and wedges on large pieces of machinery in steamboats when the space around the machinery was too contracted to work with ease. He made a small mortar, carrying an elongated bolt, which struck the key head without entirely leaving the gun, which was perforated at the sides, well forward, with holes through which, after the bolt had passed, the charge escaped. The force required was regulated by the quantity of powder used. The apparatus proved highly successful, and recently, in taking out and putting in the *New Brunswick's* shaft, it was loaded and discharged about 100 times. By its aid several days were saved in doing the work on that steamer.

**SHINING BLACK INK.**—The best shining black ink, used for mourning paper, and the manufacture of which has up to the present time been kept a secret by the makers, may be prepared, according to the *Papier Zeitung*, of lampblack, borax and shellac. The ink is made as follows: In one liter of hot water 60 grains of borax are dissolved, and to this solution three times the quantity of shellac is added. After this mixture has been properly dissolved, the necessary quantity of lampblack is added, the whole being constantly stirred. Should the luster not be satisfactory, more shellac is added.

**ANTIQUITY OF HOT-AIR FURNACES.**—The younger Pliny, writing to one of his friends about one of his country seats, mentions among other things that next to the smaller drawing-room there is a semi-circular room with windows arranged so as to get the light of the sun all day. He says: "Out of this is a bedroom which can be warmed with hot air." He also refers to the "bath with its cooling room and its hot room." As Pliny, Jr., lived A. D. 62-116, we may assume that hot-air furnaces are no new thing.

**VARNISH FOR METALS.**—A green transparent varnish for metals may be made by grinding a small quantity of finely-powdered chromate of potash, and adding a sufficient quantity of copal varnish thinned with turpentine.

**DOWN DRAUGHT IN CHIMNEYS.**—The difficulty that is experienced in some chimneys

with a strong down draught is said to have been entirely obviated by an English device. It consists of a number of grooved rings placed over each other with spaces between, and made of metal or clay. The grooves are so shaped that when the wind strikes them it is so deflected that it draws air up the chimney, and in this way effectually prevents down draught.

**AN INK RIVER.**—In Algeria, there is a small stream which the chemistry of nature has turned into true ink. It is formed by the union of two rivulets, one of which is very strongly impregnated with iron, while the other, meandering through a peat marsh, imbibes gallic acid. Letters have been written with this compound of iron and gallic acid, which unite to form the little river.

**SYMPATHETIC INK.**—An ordinary solution of gum camphor in whisky is said to be a permanent and excellent sympathetic ink. The writing must be done very rapidly, as the first letters of a word have disappeared by the time the last are written. Dipping the paper in water brings it out distinctly, and it becomes invisible again when the paper is dried. It can be brought out repeatedly without affecting its vividness.

**IRON IN ALUM.**—In order to ascertain whether alum is free from iron, prepare a solution of the alum to be tested and add to it a few drops of a saturated solution of ferrocyanide of potassium. If the solution remains clear and unchanged, there is no iron present in the alum. If iron is present it will be shown by a blue coloration of the liquid.

**FIRES FROM BURNING OIL** are inextinguishable with water, but may readily be smothered by throwing flour on the burning oil. If clothing be set on fire by spilling oil or by the bursting of a lamp, a handful of flour thrown on immediately may be the means of quenching the flames and thus saving life.

**RAPID WEIGHING.**—A method of weighing freight cars while in rapid motion has been contrived by the use of an electrical apparatus applied to the scales.

The gathering of "witch hazel," so called, is becoming a recognized industry in Southern Vermont. It is bought for medicinal purposes at \$3 a ton.

The bridge of Ayr, immortalized by Burns, and 650 years old, is to be demolished.

## GOOD HEALTH.

## A Word to the Wise.

[Written for the PRESS by JEWELL.]

For the foolish will not heed my words; they are wise in their own estimation already. This is the season when sickness prevails, because the people do not take the precaution to keep warm. A sudden change in the temperature demands a change in the clothing also, so as to keep up a normal action of the skin. Fires should be kept also in sitting-rooms, and no member of the family be allowed to sit with cold feet or to go to bed chilled. If the pores of the skin are allowed to become closed, making "goose flesh," as the old saying is, there is likely to be a determination of blood to the lungs or to the bowels, causing an attack of pneumonia or bilious fever, or other sickness, which could have been avoided by care and warmth. Then, too, when a cold snap comes, after weeks of warm weather, and all are used to the breathing of pure, fresh air, if no fires are started to warm the living-room every door and window is of necessity closed, and all are obliged to breathe confined, unoxygenized air, thus vitiating the blood and so weakening the lung tissues, making them less able to resist disease germs that are floating in the atmosphere ready to be absorbed by just such organizations as described. Mothers should look to their young children, especially those liable to throat-ailings and croup. See that they are warmly clad and go to bed with warm feet, and are happy, not cross or peevish, which is a sign of ailing. If they are going to school, see that their lunches are composed of solid, wholesome food; cake and pie are bad food to study on. Sweet bread and butter, with a taste of jam or jelly, eggs, or some cold meat or oysters for a change, are all easily digested, greatly enjoyed and easily prepared. Adding an apple or pear or grapes to the bill of fare gives the meal a hearty relish if it is cold, supplying good brain food and requiring but a simple supper of bread and milk perhaps at early bedtime. Children should never be allowed to eat later than five or half-past at night, and always a light meal. Any parent or guardian can test the truth of this by trying to sleep with a child after it has been eating a late, hearty supper.

It is the duty of every teacher, school trustee or parent to see that there is a stove in the schoolroom, ready for a fire on cold days. All danger of sickness is thus averted, by keeping the room agreeably warm, and having the door or windows open. No child old enough to go to school is too young to understand a few of the simple laws of their being necessary for health, and all teachers, parents, or guardians are culpable if they are not thus instructed. Indeed it is a grave mistake of our State Nor-

mal schools that there is no "Chair of Hygiene." What wonder that so many of the brightest and best of the classes receive their closing honors and diplomas, either physical wrecks of their former selves, or else go home to die of diseases the seeds of which were most surely implanted in their systems during the years they were so earnestly striving for the pearl of great price—an education—and losing their life in its attainment?

Is this necessary, think you? Parents, are you willing to sacrifice your girls and boys on the altar of an education? Do you not believe God's physical laws equally as important and binding upon us as His moral laws? Who is to be the one to demand of the faculty that the students entrusted to their care be instructed in all that pertains to their physical welfare?

Physiology does not teach it; anatomy does not teach these laws. Hygiene alone, practically studied and obeyed, will reach these living questions.

Los Gatos.

**THE "NOBLE FOREHEAD" FALLACY.**—It is popularly supposed that the high forehead is essential to a good brain, and intellectual superiority is usually associated with the conception of a "two-storied brow." Dr. Wm. H. Mays ably combats this idea in the *Western Lancet*. He says: "The size of the forehead depends much on the line of growth of the hair that limits it. A man may have what is called a low forehead; but if the hair could be removed to the height of four or five inches, the same individual would present as fine a specimen of the traditional 'noble forehead' as could be wished, a perfect 'dome of thought,' particularly if the frontal sinuses happened to be large or protuberant. Again, a low forehead has ever been held a sign of beauty in woman, and has certainly never been regarded as an impeachment of her mental capacity. The truth is, the front part of the brain has very little to do with the intellectual process. It is the posterior lobes of the brain with which the higher faculties of the mind are associated. Gower assigns to the frontal lobes, excepting their lower and hinder portions, a negative position as regards psychical importance. Only man possesses posterior or occipital lobes; they are the latest achievements in the long line of cerebral development. In the higher apes they may be found in a very rudimentary condition; the lower mammals possess frontal or anterior lobes only. In the lower savages, and in congenital idiots, the occipital lobes are often ill developed, approaching the brute type, giving a flattened appearance to the back of the head. In the Stockton asylum are several interesting idiots, some of whom, while possessing quite respectable foreheads, show a striking deficiency of back head. The neck and back of the head are in one line, and it is worth remarking what a foolish appearance such a contour gives an individual. When you see a lack of the rounded sweep or projection of the back of the head above the neck, you will find with it a low order of intellect. The idea that a high forehead is, taken alone, the index of mental superiority is as baseless as any of the exploded propositions of phrenology, with which pseudo-science it deserves to be classed.

**THE SCIENCE OF DRINKING.**—Consul Tanner, of Chemnitz, reports to the Secretary of State that the beer production of Germany in 1885 was 1,100,000,000 gallons, enough to form a lake more than one mile square and six and a half feet deep, or it would make a running stream as large as some of our rivers. He says the consumption of intoxicants in Germany per head is four times as great as in the United States, yet there are a thousand hopeless drunkards in the United States to ten in Germany. The difference arises largely, if not entirely, he says, from the manner of drinking in vogue in the two countries. "This science of drinking," he writes, "consists simply in the tardiness of drinking. All drinks are taken sip by sip, half of three quarters of an hour being consumed for a glass of beer. This is so simple that one is liable to ridicule for laying stress upon it, and yet on this one point hinges, in my opinion, a question of vast importance to Americans. By this manner of drinking the blood is aroused to greater activity in so gradual a manner that there is no violent derangement of the animal economy. By slow drinking the German accomplishes the object of drinking, and gives his animal economy a chance to say, 'hold enough,' which only slow drinking will do." Mr. Tanner says that since his arrival in Germany he has to see his first glass of water drunk.

**A REMEDY FOR ROUND SHOULDERS.**—A correspondent writes as follows to the *New York Tribune*: More than 30 years ago I acquired the habit of being round-shouldered. In trying to find a remedy, the following plan, which grew out of my knowledge of anatomy, came in sight: Hook the fingers of the hands together; raise the elbows as high as the shoulders and pull like a shoemaker. The muscles about the shoulder-blades, to keep them in place, are thus strengthened and in a short time enabled to fulfill their proper office. When lying on the back, press the head on the pillow so as to raise the chest up from the bed on which you are reclining. This strengthens the muscles which should hold the head erect. When standing or sitting where the head can press against something solid, repeat the operation. By a little thought at other times to use these muscles, the difficulty may be overcome.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**KENNEDY MILL.**—Amador *Sentinel*, Oct. 20: The Kennedy mill is now running 32 stamps and the new machinery works to the perfect satisfaction of all interested.

**KENNEDY.**—Amador *Ledger*, Oct. 23: The new 40-stamp mill just completed at this mine, has been running pretty steadily all the week. But 35 stamps can be run at present, owing to the inadequacy of the water supply. The pipe crossing the Oneida valley will not carry sufficient water to run the 40 stamps. About 100 inches is all that can be obtained at present, whereas it will take 120 or 130 inches to run the full works. To obviate this difficulty an additional pipe will probably be laid after awhile across the Oneida valley. The mill works as well as could be expected. All new machinery of such magnitude requires more or less fixing before it is got into perfect running order. The mine continues to look well, and there is any amount of rock to work upon. There are between 60 and 70 men employed about mine and mill. When in regular running order, it is thought the works will give steady employment to about 60 men.

**MISCELLANEOUS.**—The Quartz Mountain mill has commenced operations, with a large amount of rock ready for crushing. A new 10-stamp mill is in course of construction at Lower Rancheria; machinery and lumber nearly all on the ground. The water-power hoisting works at the McKay mine in Hunt's gulch are in successful operation.

**SUTTER CREEK.**—One of the best safeguards against the overflow of Sutter creek in flood times is being erected by Knight & Co. It is in the form of a bulkhead on the banks of the creek just above the foundry. The bank is badly washed, and in time of flood the water would pour into Eureka street, and overflow a considerable portion of the town. The bulkhead is made of the heaviest slabs, well loaded down with rocks, and when finished, the town will be comparatively secure from high water. Knight & Co. have completed the job of roofing the foundry with iron. It is one of the finest roofs to be found in the State. They have also embellished the entire foundry with a coat of paint. J. R. Tregloan, superintendent of the South Spring Hill, has accomplished a very skillful and delicate piece of work in the way of mining. He has made an upraise of 400 feet, and has run a tunnel 250 feet long to intersect. He did the surveying himself and it has proved satisfactory in every way. The upraise is intended for ventilation, and also as a means of escape to the miners in case of accident.

## Butte.

**THE GOLDEN EAGLE.**—Chico *Enterprise*, Oct. 22: This mine is situated two miles west of Paradise, in Butte county. The ore that is obtained has long been known to contain gold, but it was so combined that heretofore all efforts to separate it had baffled the skill of the most proficient assayists. By a new process called the Frisby, which was recently discovered, it has been found possible to extract the gold in a pure state from the sulphurets in which it was bound up. The mine is now a complete success, and the company who have charge of it are receiving rich returns. Very extensive works are already in operation, and it is the intention to put up a 20-stamp mill soon, as the one now used has not sufficient capacity. There are other such mines as this in the county, which have heretofore been considered valueless because the gold could not be extracted from the native ore they yield. This new process introduced so successfully at the Golden Eagle will undoubtedly lead to the opening up of these other mines.

## Calaveras.

**SHEEP RANCH.**—Calaveras *Prospect*, Oct. 22: For months past, J. B. Haggan and W. H. Clary, comprising a company owning the Pioche mine, west of town, have been pushing a tunnel in search of a quartz vein. Their labors were recently rewarded by the discovery of an excellent lode of good-paying ore. The vein is evidently the extension of the famous Sheep Ranch mine, the rock being precisely the same in character and richness. The tunnel is now in 500 feet, and the work is still being diligently prosecuted. Being a tunnel claim, it can be worked to every practicable advantage. In the near future, it is hoped, glowing accounts can be given of this property. Upon its development depends much of the welfare of our people and the longevity of our village. E. W. Forrest & Co., of the All Hope mine, near Cave City, continue to feel highly encouraged over their very flattering prospects. Good ore is being extracted from their shaft, which is at present being sunk within their tunnel. Excessive water is feared during the coming winter months, so that operations may be temporarily suspended. The company contemplates the early erection of an arastra, and arrangements for the purchase of cog gearing have already been made.

**RATHGEB.**—The Rathgeb brothers have purchased the Brenoli and Frazier ranches and the Georgia ditch. They have now a clear water-way and have about completed a large ditch to the Union mine. There is, at present, 150 men employed on the improvements at the Union mine. The water used in turbine wheels at the new mill will have a 174-foot fall.

## El Dorado.

**BLUE ROCK.**—Georgetown *Gazette*, Oct. 23: The Flynn Brothers and George Reau, of the Blue Rock mine, owing to scarcity of water, have resumed work on their quartz lode a short distance up the canyon, which they have not worked for seven years, and from which they took out 90 ounces. The quartz will be hauled to their mill (1/4 mile) and crushed.

## Inyo.

**A GOOD MINE.**—Register, Oct. 24: Reub. Spear is the owner of a mine in the Inyo range, situated about one and one-half miles from Lone Pine station. P. Caffrey has this mine under lease, and is working four or five men. He two weeks ago struck 22 inches of ore, which has a working value of 150 oz. of silver per ton, and 45 per cent lead. With this

showing Caffrey, for the last two weeks, has been averaging about \$50 per man, and hopes to continue to do well while his lease lasts, which expires Jan. 1st.

**NOTES.**—Prescott *Courier*, Oct. 22: Mr. Bryson and other miners, of Black Canyon creek, 45 miles south of Prescott, will make shipments of ore this month. N. Ellis has examined the New Era mine, and is satisfied with it. It is about four miles east of the mouth of Black Canyon creek, and carries considerable gold. There is a five-stamp mill on the ground. Jack McDonnell and other miners of Dorris camp are taking out silver ore for shipment. Messrs. Linn and Rodenburg came in yesterday from Bradshaw, with samples of gold and silver material from ledges. Messrs. T. J. Nolan and J. B. Farish took a look at some Groom creek ledges yesterday. Specimens from the Middleton mine, Big Bug district, will soon be on exhibition at Bones' ore rooms. Gentlemen who came here with Gov. Tritle will, we learn, examine the mineral resources of this section, with a view of putting in sampling and general reduction works.

**RUNNING STEADILY.**—Wood River *Times*, Oct. 22: The new mill at the Bannock Mining Co., at Era, which was completed recently at a cost of \$80,000, was given a trial run last week in the presence of all the owners, and worked to their entire satisfaction. It is now running steadily, and Captain Owens and his crew of millwrights have gone.

## Los Angeles.

**MARBLE.**—Los Angeles *Tribune*, Oct. 22: Some time ago a party having a large lime contract with the railroad company, while prospecting for limestone, discovered a large body of pure marble. Experts pronounce it superior to Italian marble, as samples submitted to ex-Governor Stanford for examination as to its fitness for his Leland Stanford, Jr. university buildings have stood every test by acid or otherwise, and the question of adopting this stone for those buildings is receiving serious consideration. The company is incorporated under the mining laws of California and the area located embraces 320 acres. The quarries are three miles from Victor station, and the fact that the California Southern Railroad Co. have concluded to construct a switch from their main line to the quarries testifies to their confidence in the enterprise. Marble of 11 different shades of color—from purest white to almost black—has been discovered—all of finest quality and taking the highest polish.

**ANAHEIM OIL WELLS.**—Anaheim *Gazette*, Oct. 23: Truckloads of black, sticky-looking casks filled with crude petroleum from the oil wells to the railroad station, and truckloads of well pipe, machinery and empty casks from the depot bound to the wells, are frequent sights on our streets, and evidence of something being done at the wells just north of Anaheim. What that something is, and its importance, seems to be but slightly understood. The work has been conducted quietly but diligently, and with such success as to satisfy the projectors that they will strike it big. The McFarland-Stewart Oil Co. is now drilling night and day on land owned by the Chandler Oil Mining Co. Their well is now down to the depth of 500 feet in fine pebble sand, yielding light oil. Heavy oil has been obtained for a considerable distance above. This well is one of four to be drilled by this company to the depth of 1500 feet. The Chandler & Maxwell Co. is sinking a well one-half mile east of the McFarland-Stewart well, which has reached a depth of 325 feet, with 11-inch casing to the bottom. Work has been temporarily suspended on this well, owing to a defective boiler, but will be resumed on Monday next with everything on the ground for a deep well. The Puente wells are but three miles west in the same belt, and are producing 120 barrels of fine oil per day. A pipe line connects these wells with Puente station, seven miles distant, which delivers the oil on the cars by simply turning a faucet. The sixth well is now being put down. The gentlemen now engaged upon the Anaheim wells having the necessary experience, financial ability and determination to succeed, will undoubtedly get what they are after. Oil is there, and they are bound to have it. A pipe line, one of the attendant necessities of the enterprise, we are assured will be laid as soon as required, and any day may bring the expected flow of oil to the surface.

## Mariposa.

**DOING WELL.**—Mariposa *Gazette*, Oct. 23: The Red Cloud mine, which is situated some 12 or 15 miles above Coulterville, in Mariposa county, we are pleased to learn is doing well, and is fast growing in importance. Every few days we hear of a fine body of ore being struck, that the vein is from 10 to 15 feet thick, and that the whole body of ore is being crushed. They have a 20-stamp mill with steam power, and plenty of wood in the vicinity. It is said they have a very lively camp over there, some 10 or 12 dwelling-houses, two or three boarding-houses, one store, two saloons, election precinct established there, expect soon to have a postoffice, a school, a church, etc. Mr. Carter, the superintendent, is erecting a fine home for himself and family, and it is located on a commanding position near the works. The mine has come to stay, and gets better as it goes down. Another shaft of 100 feet will start sinking in a few days. Alonzo Dexter, we believe it is, has taken a contract to furnish wood for the mill for one year. It can't be said but what at least one mine on the north side of the river, in the vicinity, is prosperous.

## Mono.

**THE STANDARD CON.**—Bodie *Miner*, Oct. 25: Ore shipped to mill, 324 tons. Ore bodies in mine looking well. Bulwer Standard and Standard mills running steadily.

**THE BODIE.**—West crosscut from south upraise on 700 is extended 14 feet. South drift on 800 is extended 24 feet. East crosscut from south drift on 800 is extended six feet.

**THE MONO.**—Taking out rich ore below the 700.

**THE BULWER CON.**—Report for week ending Oct. 24, 1886: Crushing 55 tons daily; the average pulp assay is \$29.65. Everything in mill and mine is running satisfactorily. There were employed 25 miners.

**THE DUDLEY.**—The south drift 700 is extended 12 feet.

## Nevada.

**KENTUCKY FLAT QUARTZ.**—Foothill *Tidings*, Oct. 22: To-day a load of quartz from Kentucky Flat,

Rough and Ready township, went through town to Rodgers' mill, where a trial crushing will be made. The ore looked very well, and Rodgers will see if it pays. The ledge is a good big one and the location is near the Beesley ranch. No name has yet been given to the ledge, but if it pays there will be a christening.

**HORSETOOTH MINE.**—*Tidings*, Oct. 20: We saw some quartz going through town to-day, and bound for Riley's custom mill. The rock was from the Horsetooth ledge, which is situated in the east part of Rough and Ready township, not far from Grass Valley township boundary line. The ledge is about 18 inches in thickness, and the rock shows some free gold. The shaft is down only 40 feet.

**EXCITEMENT IN SILVER.**—Nevada *Transcript*, Oct. 24: There is considerable excitement over recent developments at the Central mine, about a mile and a half nearly south of Banner mountain, in this district. In September, 1885, the Fowler brothers and others bonded it as a gold claim. They ran a tunnel in on the ledge a distance of 900 feet, giving backs of 500 feet, and found that it varied from 1 to 10 feet in thickness. Having erected a gold mill, they suddenly discovered the ore to be exceedingly rich in ruby silver, and to give only from \$3 to \$5 in gold as the maximum depth to which it has been developed was attained. Assays for silver give from \$40 to \$130 a ton in that metal. The stockholders, who have expended something like \$11,000 in money and labor, now find their financial means exhausted and are unable to erect by themselves the necessary machinery for silver saving; but other parties have taken a deep interest in the property and it is probable that capital will soon be forthcoming with which to sink a shaft and buy the necessary machinery. J. D. Channell, of this city, James Gluyas, of Grass Valley, and other experienced silver miners have within the past week examined the property, and they pronounce it "another Comstock." They are of the opinion that a very rich and extensive silver mine can be opened there.

**PAID WELL.**—Nevada *Herald*, Oct. 20: D. R. McKillican & Co. have sold six tons of sulphurets and tailings, from their quartz mine on the Middle Yuba river, to the Selby Smelting Co., of S. F. The sum realized was \$14,500. This is certainly a splendid showing and most encouraging to the owners of the mine, which is situated near Orleans Flat. The mill now in use is not very complete. A new mill and hoisting works, with all the improved appliances, will shortly be erected. When Mr. McKillican went below to dispose of the sulphurets, his partners expressed the belief that they would have to declare an Irish dividend, but after the sale they were surprised to learn that it would be a dividend of the other kind. The money realized, exclusive of all expenses, is sufficient to pay for the new works that are to be put up.

## Placer.

**FOREST HILL.**—Cor. Placer *Argus*, Oct. 20: The Live Oak mine, near Forest Hill, has moved its works over to the Brushy Canyon side, and will tap their present works through a tunnel about 1700 feet in length. The tunnel is the old Dutch Washington, which is in a distance of 1200 feet, thus leaving only several hundred feet to run. Ground is being cleared and timbers hewn for a 10-stamp mill which is soon to be built.

## Shasta.

**IGO.**—Cor. Shasta *Courier*, Oct. 22: Capt. E. H. Atkins has bought Robinson & Cooper's interest in the Chico mine and mill. He is now arranging for the erection of a Russell furnace. Messrs. Bennett & Little have the two Duncan concentrators formerly at the Chico in place at the Continental mill, and are ready to start crushing ore as soon as the water supply permits. The shaft is bailed out, and more ore will soon be added to that already out. Assessment work is being done on the Chicago, Confidence and some other claims. D. Enbanks & Sons have their arastra about ready to start, and expect a successful winter's run. Smith & Everet have found a body of good gold ore on a ledge south of the Continental mill. E. L. Ballou's arastra is running on Manzanita ore. The Meek arastra is running on Hubbard & Shirland's Atlantic ore. The mine is looking well. Robinson & Cooper are taking out some ore at the Central. O. Engle and H. Dunham are doing some work on their Kanaka gold ledge. The Hardscrabble Co. is preparing for its winter's run.

## Sierra.

**THE YOUNG ITALY.**—Sierra *Tribune*, Oct. 22: Work was begun last Monday on the Young Italy mine, which is located above the Cleveland. The claim is owned by Messrs. Sam Stevenson, Chas. Quirollo, John Corolla and Jack Lagamorcino. They have a 4-foot ledge which prospects well.

**YOUNG AMERICA.**—The company is still driving the new tunnel ahead on the other side of the upper Sardine lake.

**RED ROCK.**—Mountain *Messenger*, Oct. 23: Mr. W. M. Towle, from Red Rock, was in town this week. Red Rock is a small mining camp, situated on the west side of the Mojte Cristo ridge, comprising the ground, some 500 acres, lying between the famous old mining camp of Monte Cristo, where two million dollars of gold has been taken out, and the Shamrock mine, at Fir Cap, which has yielded over \$400,000. His tunnel is about midway between the two places, and is running in on an apparent outbreak from the ridge that carries some gold. The outlook is good for the development of another of Sierra's valuable mines. The Wide Awake Co. have given out a contract to run 200 feet of tunnel at their mine on Craycroft Hill. The portable steam sawmill for the Empire mine at Gold Valley passed up a few days ago. The company is putting on all the men it can get, in order to get things fixed so it can work this winter. We hear that 40,000 brick are in kiln, ready to burn. Mr. Hill is again running his arastra night and day.

## NEVADA.

## Washoe District.

**CON. CALIFORNIA AND VIRGINIA.**—Work is being rapidly pushed on the 1300, 1400, 1500, 1650, 1750, 1850 and 1950 levels in Con. California and Virginia ground, the battery assays from the ore being extracted on these different levels during the past week averaging \$30 to the ton.

**ALTA.**—Virginia *Enterprise*, Oct. 23: The winze is now down 40 feet, and at the present time

is altogether out of ore, owing to its dip, as it is being driven down on an angle of 45 degrees. It is, however, in good working ground. The upraise from crosscut No. 1 is up about 48 feet from the 725 level, and is in quartz giving low assays. It looks very favorable in the upraise for ore at a future date.

**OCCIDENTAL.**—The old workings are still being retimbered west of the main tunnel line. The upraise has been advanced about 20 feet. In Gold Hill the Yellow Jacket, Kentucky, Crown Point and Belcher are taking out and shipping the usual amount of ore, with no change in the different workings of the mines.

**BENTON CON.**—They are running south on the Keystone drift and in very hard rock. There is no material change from the last report. The Lady Washington drift is out 112 feet and is in vein formation giving occasional good assays, there being rich bunches and streaks of ore in the face of the drift.

**SIERRA NEVADA.**—On the 520 level, west crosscut No. 4 started at a point 160 feet south from west crosscut No. 3 from the north lateral drift, was advanced about 20 feet; total length, about 120 feet. West crosscut No. 5 is still being advanced.

**CHOLLAR.**—There are about 30 men at work in the old Chollar shaft, engaged in repairing drifts and cleaning up generally. Work will soon be commenced and prospecting done for the ore that must have been left in early days.

**OSBISTON SHAFT.**—All work in the Osbiston shaft has been stopped. The pumps are still running on the 2500 level. Work will not be renewed until it is proven whether the water from the Combination will affect the shaft.

**SAVAGE.**—The drift on the 600 level is running south to connect with the old Savage shaft, there being no change in the character of the ground. The drift is in 430 feet south from the Savage north line.

**HALE AND NORCROSS.**—All work has been stopped for the present. It is expected that work will soon be commenced in the upper levels, conducted through the old Hale and Norcross shaft.

**BEST AND BELCHER.**—The main northeast drift on the 600 level of Best and Belcher is being still continued, with no change from the last report. All work in the southeast drift has been discontinued.

**GOULD AND CURRY.**—The station on the 425 level in the Bonner shaft has been cleaned out and retimbered. The main west drift from the station has been reopened and retimbered a distance of 400 feet.

**UNION CON.**—West crosscut No. 1, on the 700 level, and the joint Mexican and Union west crosscut at the south line, are being pushed rapidly ahead.

**UTAH.**—The station on the 472 level has been completed. The west crosscut has been advanced 54 feet; total length, 150 feet.

**OPHIR.**—Repairs and retimbering are still going ahead on the 1465 level.

## Aurora District.

**PROSPECTS.**—Walker Lake *Bulletin*, Oct. 20: Mr. Alfred E. Ann, managing director of the Consolidated Esmeralda, passed through Hawthorne, last Friday, on his way to England. Under the management of A. E. Ann and R. R. Colcord, the general superintendent, the prospects of the company are very much improved. Samples taken from the Durand assay over \$2000 per ton. The vein is tapped in two different places, 180 feet apart, and in the deepest winze, drifting has commenced north and south, all in rich ore. The appearance now indicates an enormously rich mine which will cause some excitement in the old town of Aurora. The ore is being hauled to the mill and crushing will commence Nov. 1st. The purchase-money has all been paid and the deeds duly recorded here.

## Belmont District.

**ORE.**—Belmont *Courier*, Oct. 23: Ernst & Esser's team pulled out for Eureka, on Monday, laden with ore belonging to Deputy Sheriff John N. Griffin. This ore was taken from the Highbridge mine, East Belmont, and is sent to Eureka for reduction.

## Dun Glen District.

**THE GOLDEN CHARIOT.**—Silver *State*, Oct. 20: The new mill recently erected by Thomas & Hendra on the Golden Chariot mine, at Dun Glen, is running steadily and successfully under the superintendency of C. S. Leonard, an experienced millman, who thoroughly understands gold amalgamation. The mine is looking splendidly, the vein being between four and five feet thick.

**ENCOURAGING.**—Silver *State*, Oct. 24: Reports from the Dun Glen gold mines are very encouraging. The Ross mine is looking better than for some time past, and the mill is running steadily. The Golden Chariot mill, recently erected by Thomas & Hendra, is doing excellent work under the supervision of C. S. Leonard, and is turning out gold bars pretty rapidly.

## Garfield District.

**A GOOD PROFIT.**—Carson *Index*, Oct. 20: Chas. H. Rutison, of Garfield Mining District, has sold a quantity of ore to the new Reno Reduction Works, and says he is more than satisfied. His ore is worth about \$300 per ton. He got \$16 per ton more for it than if he had sold to Joe Douglas at Dayton; \$33 more than if sold in San Francisco, and \$25 to \$30 more than it would bring at Denver. At the latter place the working charge is \$15, at Reno \$14, while both work the ore up to 95 per cent. At San Francisco they only work it up to 90 per cent and charge \$20 for working. At Dayton they calculate on about the same figures.

## Eureka District.

**A GOOD SHOWING.**—Eureka *Sentinel*, Oct. 23: Notwithstanding the cry of dull times heard from many of our business men, the mines of Eureka District continue their output of ore in good shape. The number of producing properties form a favorable comparison with any district on the coast, if the quantity produced does not. This latter feature is due, in no small degree, to the few men that are employed in mining here, not one of the properties aside from the Richmond, Eureka Con. and Dunderberg, employing over a dozen miners, and in most cases but two or three each. No reliable information can be obtained of the productions of the two first-named mines, but judging from the trains of ore

oftentimes seen coming down from them, they are by no means exhausted to the water levels, below which little prospecting work has ever been done. The Eureka Con. Company has of late months done considerable work of a practical character, of which more will be said hereafter. Among the improvements added to their smelting plant recently is a new refinery, and yesterday the company made its first shipment of refined bullion (three bars, valued at \$5095.44) through Wells, Fargo & Co.'s express. A week ago, the four owners of the Silver Connor mine, on Prospect Mountain, declared a dividend of \$250 each, and a shipment of 60 tons of ore was sent down from the property on Thursday last to the Richmond reduction works. This, together with what ore is on the dump, is sufficient to warrant another like division of net profits next month. The ore works from \$50 to \$100 a ton, most of which is gold. The Jackson mine, the stock of which is listed on the San Francisco Board, has on its dump over 50 tons of rich ore that assays higher in gold than silver ready for shipment. This company declared on Wednesday last a dividend of 10 cents a share on its capital stock, and judging from information at hand, another like disbursement will be made before many weeks. From Superintendent Powell, the *Sentinel* learned yesterday that a new body of ore was, the other day, discovered on the third level of the mine, by miners working for day's pay. About all the ore produced from the property during the past year has been by tributaries. It was only a few weeks ago that the management decided to prospect new ground at their own expense and risk, and it must be encouraging to have their efforts and judgment rewarded in so short a time. About a dozen miners, in all, are employed in the property. During the past week, the Dunderberg Company shipped from their mines on Prospect Mountain, to the Eureka Con. reduction works, 30 tons of ore. From the Macon City, on Adams Hill, 1 ton was sent down; from the Bullock, on McCoy Hill, 2 tons; the Summit, on Prospect Mountain, 1½ tons; Eureka Tunnel, same section, 4½ tons; Lord Byron, 8 tons; Geddes and Bertrand, Secret Canyon, 3 tons; North Star, on the range immediately west of Prospect Mountain, 3 tons. During the same period, shipments were made to the Richmond reduction works, from mines on Adams Hill, as follows: Silver Lick (rich ore), 23 tons; Members, 9 tons; Oriental and Belmont, 47 tons; Bullwhacker, 18 tons. From the Hamburg mine, on Prospect Mountain, a shipment of 33 tons was made, and from the Geddes and Bertrand, Secret Canyon, 48 tons. From the White Pine mine near Hamilton, 4½ tons were shipped to the Richmond works, and from the Featherstone property in Robinson Canyon, 12 tons to the Eureka Con. works. Everything considered, the above is a good showing for the mines of this district. Several tributaries are said to be holding back their ore, in anticipation of better prices for silver and lead, neither of which metals is selling for what they should. With silver at even \$1.20, and lead at 5 cents, a prosperous era would soon follow, for there would be more active operations inaugurated.

**ANOTHER SILVER CONNOR DIVIDEND.**—Eureka *Sentinel*, Oct. 17: Another shipment of ore of 61 tons was made the other day from the Silver Connor mine on Prospect Mountain to the Richmond smelters that worked \$41 in silver and \$59 in gold to the ton. As has been stated in these columns, the property is owned by four citizens, and yesterday they decided to declare a dividend of \$250 each. They have at their mine ready for shipment 40 tons more of the same kind of ore, which insures them another dividend equally as large next month. At present there are but four miners at work in the property.

#### Mount Rose District.

**SUPT. McCURDY'S REPORT.**—*Silver State*, Oct. 20: Milling ore, 120 tons, 920 pounds; delivered to the mills. Average assay value, per ton, 48.69 oz. silver; 0.30 oz. gold. Mill run 191½ hours; worked 118 tons. Mill-work—Three Huntington centrifugal roller mills; six Triumph concentrators. Number of men on pay-roll, 132. No change in appearance of the mine at different points of working to report for the week past. Everything in and about the mill and mine moving along smoothly.

#### Ophir District.

**BULLION.**—Belmont *Courier*, Oct. 23: The Chicago Mining and Reduction Co.'s bullion output from their Ophir mining property continues steady.

#### Patterson District.

**COMING TO THE FRONT.**—*Pioche Record*, Oct. 20: Old Patterson District is again coming to the front. Ed. L. Robertson and others interested in mining property there, we learn, are having a quartz mill brought into the district. All who have seen the mining property owned by these parties speak very highly of it. All water rights, etc., were secured several months ago.

#### Pioche District.

**MEECH PROCESS.**—*Pioche Record*, Oct. 20: A plant for the new leaching process arrived in Bullionville on last Sunday. It is called the "Meech Process." It is hoped that this new method will prove a success and it is said that a thorough test of the tailings was made before the plant was shipped. If this plant will do what it is said it will, it will not be of pecuniary benefit only to the stockholders, but to the people of the county at large.

#### Tuscarora District.

**BELLE ISLE.**—*Times-Review*, Oct. 22: Belle Isle and Navajo joint crosscut, 150-foot level, has been extended 27 feet during the past week; total length from west vein 402 feet. The formation shows no material change.

**NAVAGO.**—No. 1 winze, east vein, 350-foot level, has been sunk 8 feet; total depth, 36 feet. The vein is carrying down a fair grade of ore. Cutting out for No. 1 winze, same level on west vein, has been completed, and sinking commenced. Have commenced cutting out for a winze on the east lateral vein, same level. The vein at this point is showing some very high-grade ore. Crosscut east, 150-foot level, has been extended 20 feet. South drift, west vein, same level, extended 12 feet. Good progress has been made with the work at all other points.

**NORTH BELLE ISLE.**—Main gangway drift on the 150-foot level has been extended to the line, and the Nevada Queen Co. takes the work at this point and continues the drive on north. No. 1 winze has been sunk 7 feet the past week, and the large width of high-grade ore continues on down. South drift from No. 1 crosscut has been connected with north

drift No. 2 crosscut, as they did not meet on end lines, as the latter was driven in the hanging wall of the vein and the former in the foot wall portion of the vein exposing about 20 feet in width of the vein. Work has been suspended in the south drift from No. 2 crosscut, as it is in this drift that No. 2 winze has been started. The station has been cut out and sinking commenced. The winze has been started down in a good width of first-class ore. Intermediate crosscut between Nos. 2 and 3 crosscuts has been extended a total distance of 59 feet. The vein at this point shows a width of 8 feet of fair-grade milling ore. The main gangway north from 300-foot level has been extended a total distance of 125 feet; progress the past week 14 feet. To-day the force in the face of this drift has been doubled and reduced to eight-hour shifts, in hopes of making a rapid drive, to the line between the North Belle Isle and the Nevada Queen. Good progress is being made with the work on the ore road, orehouse and all work in and about the mine.

#### Tybo District.

**FINE ORE.**—Belmont *Courier*, Oct. 23: Some very fine ore has been encountered in Luse's mine, Tybo, and the find is showing every indication of proving extensive. All that is needed to make Tybo a large bullion producer again is capital to properly open and develop its mines.

#### ARIZONA.

**NEW DISCOVERY.**—Mohave *Miner*, Oct. 17: Messrs. Holloway, Moses and Trembath are working vigorously on their new discovery, and are taking out quite a quantity of ore. There is everything in the appearance of their claim, as they go down to warrant the belief that they have struck it rich.

**SORTING.**—J. J. Hyde has now five men employed in sorting the Keystone dump. There has been only one shipment of ore made since the work began; but this, having made a paying return, encourages the prosecution of the enterprise. If anybody was ever sincere in wishing success to an undertaking, we are in wishing it for this one.

**THE SILVER KING.**—Tucson *Citizen*, Oct. 24: Mr. W. B. Pierce is here from the Silver King. He says there is little being done in mining circles there outside of the King, which is working a force of 140 men and making regular shipments of bullion to the value of about \$80,000 monthly. A winze has been sunk from the 700 to the 800-foot level, which is all in ore varying from \$50 to \$10,000 per ton, the low grade largely predominating, however. He says there is no truth in the rumor that the 800-foot level is destitute of mineral; that there is very little of the sparkling silver found above but plenty of low grade, less handsome ore. There is no semblance of a ledge, the entire mine appearing as an immense blow-out without regularity and character. The King Co. now owns the Bilk mine which they are re-timbering preparatory to resuming operations this winter. By many this mine is esteemed second only to the King. The Woodpecker, which lies 14 miles to the southeast, is at present working but a small force of men, pending the arrival of machinery which is expected the coming month. Mr. E. O. Kennedy is the superintendent, and expresses great faith in the ultimate importance of the camp. Mr. Pierce left for the East this morning.

#### COLORADO.

**NEW STRIKE AT CARIBOU.**—Boulder *Herald*, Oct. 22: One hundred and ten sacks of ore were received to-day at Potter's agency, from the Eureka mine, near Caribou, being about two miles north-west on the southern slope of Bald Mountain. This mine is owned by W. H. Barber, George Lytle and R. K. Thayer, the first two owning a quarter interest each and the latter a half interest. It is not a new find, only new working on an old find. It must be the value of the find was not recognized years ago, for when working on it began lately, at the depth of 10 feet ore was found which went as high as 800 ounces to the ton. The sacked ore as run through the mill has yielded from 68 to 130 ounces silver to the ton. It is peculiar ore, too, as it is soft and can be shoveled out without any hard work. Blasting is not necessary. The shaft is now 30 feet deep, the pay streak 30 inches wide, and two men daily raise 50 sacks of the good ore. There is considerable ruby silver in the ore. A tunnel is now being run by two shafts further down the hill, so as to be ready for the miners when the cold winter weather comes on. The finding of this rich mine has had a beneficial effect on that section. It shows that ore can be found even off Caribou and Idaho Hills, for the Eureka is two miles off. The consequence is that there is to-day more prospecting done in the neighborhood of Caribou than there has been since the exciting days of the first discovery of the Caribou mine.

#### DAKOTA.

**THE TERRY'S PEAK MINES.**—*Tribune*, Oct. 20: The Terry's Peak mining region is full of rich mines, and new ones are being found constantly. Many prospectors own claims in that region who have been driving tunnels and sinking shafts for the past 8 or 9 years, and had, until a short time ago, developed but little. Not a few of them did not know the value of their property until quite recently. They had sunk their shafts and driven long tunnels in the slate rock, ignoring the flat quartzite which caps nearly every ridge in the vicinity of Terry's Peak, thinking it was barren rock; some thought it was granite. They have learned recently that the flat ledge of quartzite, which was disdained because it was flat more than for any other reason, contains large bodies of rich gold ore—that is rich enough to ship to Omaha, and return a handsome profit to the owner. The ore bodies, without exception, occur in direct connection with a yellowish-gray porphyritic rock, though there are numerous instances of such a contact of quartzite and porphyry where there is little or no ore. The known extent of this mineral district is being daily extended. There are a number of streams which head at the foot of Terry's Peak, and every ridge, without a single exception, is capped with the Cambrian quartzite, carrying ore bodies. The area of the district, thus far only partially opened, is fully 2000 acres. Of course, a large portion of this is taken up with gulches and barren ground. Probably one-half of the area is included in gulches, and of the remainder, probably not more than one-tenth is underlain with ore, but even this is something enormous. Presuming the

ore bodies to have an average thickness of four feet, it would indicate upward of a million and a half tons of ore, much of which will average over \$50. In the present state of development, it is impossible to make even an approximate estimate, but we believe that district to be one of the richest in the world. It is but from three to five miles distance from Lead City, and many of our best citizens are interested there. The working of these bonanzas will furnish employment for several hundred miners, and will place in circulation hundreds of thousands of dollars.

#### IDAHO.

**LOCAL NOTES.**—*Idaho Statesman*, Oct. 19: Jake Reeser, of Rocky Bar, has sold his one-third interest in the Vishnu mine to E. C. Thompson. Barclay & Winder recently had eight tons of Vishnu ore crushed which yielded them nearly \$3000. The Minnie Moore mine shipped 700 tons of ore last month, and it is expected to ship 1000 tons this month. It is claimed that there is \$2,000,000 worth of ore in sight in the Minnie Moore mine near Bellevue, Wood river. The ore runs from \$125 to \$160 per ton. Discoveries of high-grade, free-milling ore, in large quantities, have recently been made in Deadwood by Boise City persons. Assays run into the hundreds. Placer mining in Southern Idaho has nearly ceased for this year, except a few claims on Snake river and a few claims in Boise county run by Chinamen. The season has been a fair one and an average yield of dust has rewarded the miners. Sheep Mountain is coming to the front as a camp rich in silver deposits. A number of big ledges have been discovered and located in that district this summer. Assays run all the way from \$100 up into the thousands. Work on the Gold Hill mill, Quartzburg, is being rapidly pushed forward, and in a little while there will be no remaining evidences of the late fire, except to see a better mill in the place of the old one. Harry Bahr left some samples of ore at this office, taken from recent discovery in Deadwood. Some of his ore assays \$800, and his ledge is 30 feet wide. We congratulate Harry on his good fortune and hope he may yet be numbered among the bonanza kings. From the amount of mining supplies going into Flint we judge a busy camp will be maintained there all winter. Considerable capital has been invested there during this year, and the investors evidently do not intend that their investments shall be idle capital. All doubts about the richness and permanency of the Shoshone county mines (Cœur d'Alene) have been removed. This season's work and developments indicate that deposits of great richness cover a vast extent of country and that scarcely a commencement has been made, all of which goes to prove that Idaho as a whole contains more mining ground than any of her sister Territories. Although no report was made to Assayer Wild last year in regard to the production of precious metals in Idaho county, the claim is made for that county that it is the third largest producing county in the Territory. We think the claim is erroneous, though a good deal of gold is produced every year. Assayer Wild is now in Idaho county gathering statistics for his report for the production of 1886. Work in many of the quartz mines in Alturas, Lemhi and Custer counties will cease this month for the season. In the districts lying high up in the mountains snow falls so deep that it is impossible to get in and out to the mines, and unless special arrangements are made operations have to cease during the winter months. In some of the best paying mines, however, every arrangement has been made for the comfort and safety of the miners, and work will be prosecuted all winter.

#### MONTANA.

**VIRGINIA CITY.**—Butte *Miner*, Oct. 23: The New York & Montana Mining and Milling Co. are successfully treating the different ores that are brought to them. At the present time they are sinking on their own property, the Alameda mine, and have time to do some custom work. They have just made a contract to treat 100 tons of ore from the Prospect mine, with the privilege of as many more tons, up to 100, as the owners of the mine may see fit to furnish. This mine is one mile west of Virginia City, and is owned by George Layton and S. B. Rice. There is probably more development work done on it than on any other mine in that vicinity. About 1200 feet of tunnels have been run on the ledge and some stoping has been done. The ledge matter varies from 5 to 15 feet in width, and a large number of samples taken by a party who was experting, the mine averaged between \$30 and \$40 per ton. In the lower level of the mine a shaft was sunk to a depth of 110 feet to water level and this develops the mine from top to bottom, 500 feet, and throws an immense body of ore in sight. Above the water level a portion of this ore is free milling, but the richest is refractory, and will require roasting to successfully treat it. There are many other mines here with more or less developments and fair prospects. The placers are all worked by bedrock flumes and although the water supply has been short the usual amount of dust has been extracted. From a reliable informant I learn that each 100 feet of old Alder gulch, notwithstanding the fact that it has been repeatedly worked over, still yields \$7000 in bankable dust and proves the fact that it is a good property to hold fast to and work. There are a dozen bedrock flume companies working at different points with good results.

#### OREGON.

**QUARTZ AND PLACER.**—Jacksonville *Times*, Oct. 22: Everything is in readiness for a good water supply at the Sterling Co.'s mine. The Portland Reduction Works are up and the machinery is being placed in position. Some very good quartz has been struck in Grob & Brändel's mine on Jackson creek. The California Co. have suspended operations on their ditch near Kerbyville for this season. The Wagner Creek Mining Co.'s quartz mill still lies idle, and when it will be started again is not known. Work continues day and night at the Hope ledge on Wagner creek, which is proving remunerative. John Miller is rigging his hydraulic claim on Farmer's flat for winter and expects to make a better run than ever. Capt. Ankeny says he will operate the Blue Gravel hydraulic mines on Galice creek during the coming season. J. N. Casteel has sublet the contract of digging C. C. Beekman's tunnel on Jackson creek to a miner from abroad.

Blalock Bros. have purchased a lot of pipe and will work their diggings on Pleasant creek in the most improved style. There is considerable activity in quartz mining in the Wagner creek district, some excellent ledges having been struck there. L. D. Brown & Co.'s new quartz mill, which is situated about two miles from Gold Hill, commenced to crush quartz this week. Wm. Bybee has purchased Isaac Skeeter's interest in his mines in Waldo precinct, but they will be operated next season by Mr. S. Burrage & Pomeroy have commenced tunneling into their iron mine near Rock Point, and will do considerable prospecting there at once. Wm. Hurst and E. T. Bartlett, of Ashland, who have been prospecting the placers of Cottonwood creek, Cal., report excellent discoveries. Klippel, Howard & Co. will commence sluicing at their diggings on Applegate in a short time, having run a ditch to them from the Applegate. Bybee & Hall's placer mines on Canyon creek, Josephine county, are in readiness and will be operated on a large scale during the coming season. The Sterling Mining Co. is negotiating for the purchase of Saltmarsh & Co.'s mines near Sterlingville, and we learn that a sale has been effected. G. B. Caldwell & Son have already started their hydraulic in the Steamboat district, having plenty of water, and will make an extended run. Preparations for the mining season continue unabated, and should there be plenty of rain, more gold will be taken out during the coming winter than for several past. Simmons, Decker & Co., who recently purchased Desselles & Connell's mines on Scotch gulch, Josephine county, are enlarging the ditch which carries the water. Klippel, Baume & Co.'s new quartz mill on Shively gulch is about ready to commence operations. It is a first-class one and will, no doubt, be of great benefit to this section. The Wines mines in Jump-off-Joe district are being fitted up with hydraulic pipe and giant by Cornelius & Co., the new proprietors. They will commence operations soon. C. W. Cornelius, of Portland, has purchased an interest in L. D. Brown's quartz mill and contract, and is on the ground, in company with Messrs. Braden & Haskell, who are also interested. The mineral exhibit of Baker county continues to be one of the most attractive features of the Mechanics' Fair, and is opening the eyes of capitalists to the fact that there is something else in Oregon besides wheat. It is reported that another strike has been made not far from the residence of Jos. Douden, on Rogue river, which is said to equal the far-famed Gold Hill discovery in richness. We have been unable to ascertain the full particulars as yet. John Wright, Fred. Bloch and Jack Hepburn, of Union, who returned from the Pine creek mines last week, have numerous specimens of quartz that are literally loaded with gold, the sight of which will make an ordinary man's eyes open very wide.

#### NEW MEXICO.

**HERMOSA.**—Black Range, Oct. 22: The Palomas Chief made a shipment of ore this week. Geo. Leaming has commenced assessment work on the Atlantic Cable. The Eagle is looking well and is producing shipping ore. Frank Reavis will commence work on the Small Hopes, which adjoins the Argonaut. J. C. McCoy is taking out and sacking ore which runs from 160 to 360 ounces from his Big Tree mine. A new strike has been made on the Argonaut Con. mine. The new strike consists of the two kinds of ore, one a chloride ore and the other galena containing brittle silver. This new ore is thought to run about 500 ounces to the ton.

#### UTAH.

**REVIEW.**—Salt Lake *Tribune*, Oct. 22: The week has seen the oncoming of the autumn storms, which appear to have materially checked the movements of the metals. The special event of the week has been the successful starting of the Hannock mill, on Lava creek, Idaho, the stock of the company being mainly held in Salt Lake City. The receipts in this city for the week ending October 20th, inclusive, were: Of bullion, \$60,580.67; of ore, \$25,574.72; a total of \$86,155.37. For the previous week the receipts were \$188,181.66, of which \$127,475.55 was in bullion and \$60,655.11 was in ore. The output of the Ontario for the week was 16,001.81 fine ounces of bullion; no ore sales. The Daily produced eight bars of fine bullion during the week, 9735.70 ounces. Base bullion receipts for the week were valued at \$16,400; fine bars, \$14,215.67; gold bars, \$8000. The Hanauer smelter produced during the week \$19,080 in bullion. The Stormont sent up during the week \$2885 in silver bars. Ore sales during the week: By Wells, Fargo & Co., \$1375; by McCormick & Co., \$17,990, including \$4530 Queen of the Hills and \$4460 Crescent; and \$6209.72 by T. R. Jones & Co.

**ORE AND BULLION SHIPMENTS.**—During the week the Crescent shipped 500,105 pounds of concentrates, and 120,000 pounds of first-class ore. For the week ended yesterday the Mackintosh sampler received 424,890 pounds of Ontario ore, 60,780 pounds of Daly, 85,820 pounds of Sampson and 21,640 pounds of Apex ore; total, 593,130 pounds. The output of Daly bullion from the Marsac mill for the week was seven bars, containing 6743 fine ounces of silver. The Ontario bullion product for the week was 24 fine bars, containing 16,001.81 ounces of silver.

**PARK NOTES.**—*Record*, Oct. 23: The Apex is shipping ore again. John O'Donovan and others are pushing work on the Silver Key group near the Apex, with very good results. On Scott Hill, Mr. Kennelly is pushing development work, principally by driving a tunnel into one of his claims from Iron Canyon. The batteries at the Ontario mill are undergoing repairs, mainly by having new stems, shoes and dies put in. The mill is running as usual and better results will be forthcoming. The grading of the hill on the Crescent company's ground is finished and in the spring the \$30,000 hoisting works will be erected. The tramway brings down about 100 tons of ore a day, and that and the concentrator will be kept running till Dec. 1st, if weather permits. Jas. M. Kennelly is working 13 men on the Kennelly group, between the Anchor and Daly, and five on his Scott Hill group. The tunnel on the Great Basin is in about 130 feet and development work is being prosecuted on the Marshall, Marshall No. 2, Great Basin No. 2, Helen, Little Edith and Minnehaha claims also. Work will be prosecuted all winter on these claims, and Mr. Kennelly says he intends erecting steam hoisting works on his property next spring.

## Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveat filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

### Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

### Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communi-

cations and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

### Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

### Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

### DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and Pacific Rural Press, 252 Market Street. Elevator, 12 Front St., S. F.

## Practical Hydraulics.

By P. M. RANDALL.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

### Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated: General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulae Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated, and Expressed in Formulae and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, \$2.00, post-paid. Sold by DEWEY & Co., Publishers, 252 Market St., San Francisco.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

## HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

**No. 1 (XX) is the Strongest Explosive Known.**

**No. 2 is superior to any powder of that grade.**

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - - San Francisco, Cal.

Will attend to business in connection with mines in So-  
nora or Arizona.

WM. D. JOHNSTON,  
ASSAYER AND ANALYTICAL CHEMIST.  
514 Kearny Street,  
SAN FRANCISCO, - CALIFORNIA  
ASSAYING TAUGHT.

Personal attention insures Correct Returns.

W. A. GOODYEAR,  
Civil and Mining Engineer  
MINING EXPERT and GEOLOGIST.  
Address care of Dewey & Co., 252 Market Street, San  
Francisco, Cal.

JOHN TAYLOR & CO.,  
IMPORTERS AND DEALERS IN  
ASSAYERS' MATERIALS, MINE  
AND MILL SUPPLIES,  
CHEMICAL APPARATUS AND CHEMICALS, DRUG  
GISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco

We would call the attention of Assayers, Chemists,  
Mining Companies, Milling Companies, Prospectors, etc.,  
to our full stock of Balances, Furnaces, Muffles, Crucibles,  
Scorifiers, etc., including, also, a full stock of  
Chemicals.

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast, we feel  
confident from our experience we can well suit the de-  
mand for these goods, both as to quality and price. Our  
New Illustrated Catalogue, with prices, will be sent on  
application.

Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application. Agents for the Patent  
Plumbago Crucible Co., London, England. Also for E.  
G. DENNISTON'S Silver Plated Amalgam Plates. The  
plates of this well-known manufacturer are thoroughly  
reliable, and full weight of Silver guaranteed. Orders  
taken at his lowest prices.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 28 STEVENSON STREET,

Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1869

Ores worked by any Process.  
Ores Sampled.  
Assaying in all its Branches.  
Analyses of Ores, Minerals, Waters, etc.  
Working Tests (practical) Made.  
Plans and Specifications furnished for the  
most suitable Process for Working Ores.  
Special attention paid to Examinations of  
Mines; Plans and Reports furnished.  
C. A. LUCKHARDT & CO.,  
(Formerly Huhn & Luckhardt, )  
Mining Engineers and Metallurgists.

South 10th St., Philadelphia. Branch Of-  
fices—47 Rose St., New York, and 40 La Salle  
St., Chicago. Agent for the Pacific Coast—  
Joseph H. Dorety, 529 Commercial St., S. F.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and  
high heads are utilized, and are guaranteed to give more power with less water than  
any other wheel made. Being placed on horizontal shaft, the power is transmitted  
direct to shafting by belts, dispensing with gearing.  
Estimates furnished on application for wheels specially built and adapted in  
capacity to suit any particular case.  
Further information can be obtained of this form of construction, as well as the  
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,  
by applying to the manufacturers.

COAL MINES OF THE WESTERN  
COAST.

A few copies of this work, the only one ever published  
eating of Pacific Coast Coal Mining, have been obtained,  
and are for sale at this office for \$2.50 per copy. It was  
written by W. A. Goodyear, Mining and Civil Engineer,  
formerly of the California State Geological Survey.

A Good Opportunity for a Ma-  
chinist.

A variety of good Tools, Patterns, etc., with business  
for sale cheap by a party retiring from business. A  
splendid opportunity for an enterprising mechanic.  
Address A. B. O., care of this paper.

THE RUSSELL PROCESS COMPY.

NEW YORK OFFICE, 18 BROADWAY  
Room 709.

## THE CONSUMERS' COMPANY. VULCAN B B AND AJAX.

The Best LOW GRADE EXPLOSIVES in the Market.  
SUPERIOR TO BLACK OR JUDSON POWDER.

Vulcan Nos. 1, 2 and 3,  
The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank  
Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

**VULCAN POWDER CO.**  
218 California Street, San Francisco, Cal.

## THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

**GIANT POWDER or DYNAMITE,**  
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and  
GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blast-  
ing Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and  
saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

**BANDMANN, NIELSEN & CO.**

CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO, CAL.

## THOMAS PRICE'S ASSAY OFFICE, CHEMICAL LABORATORY,

BULLION ROOMS and ORE FLOORS,  
524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed  
of in the Open Market to the Highest Bidder.

The Jackson and Powell-street Railroad Company has given the Pacific Rolling Mills an order for \$50,000 worth of rails and girders for the road.

## New York Metal Market.

Telegraphic advices dated Oct. 27th give the following New York prices:

BORAX—5 1/2 @ 6 1/2 c.  
COPPER—LAKE—\$11.25 @ 11.37 1/2.  
IRON—No. 1, \$17 @ 18.00.  
LEAD—\$4.85 @ 4.95.  
QUICKSILVER—54 @ 55c.

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Steady, spot closing @ 11.40 @ 11.75c. Transferable Notices (Lake) issued at 11.50. Transferable Notices (Chili Bars) issued at 14.41 5/8. LEAD—Dull at \$4.05 @ 4.20c spot. Transferable Notices issued at \$4.12 1/2. TIN—Quiet at \$22.15 @ 22.30. Transferable Notices issued at \$22.05.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$22.00 @ 22.75; Billiton Tin, \$23.00 @ 23.25; Banca Tin, \$23.00 @ 23.50; Baltimore Copper, \$10.20 @ 10.50; Orford Copper, \$10.25 @ 10.75; P. S. C. Copper, \$10.25 @ 11.00; Foreign Lead, \$4.35 @ 4.60; Foreign Spelter, \$4.85 @ 4.90.

MAKER'S PRICES—At tidewater, 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$18.50 @ 19.50; No. 2, \$17.50 @ 18.00; Grey Forge, \$16.00 @ 16.25. Hudson River, Grade No. 1, \$18 @ 19.00; No. 2, \$17.50 @ 18.00; Grey Forge \$15.50 @ 16.00. Southern, Grade No. 1, \$18.00 @ 19.00; No. 2, \$17.00 @ 18.00; Grey Forge \$15 @ 16.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.  
G. W. INGALLS—Arizona.  
E. L. RICHARDS—San Diego Co.  
R. G. HUSTON—Montana.  
GEO. McDOWELL—Fresno and Tulare Cos.  
O. F. BERGMAN—Tehama and Colusa Cos.  
J. H. SMITH—Plumas and Sierra Cos.  
J. C. SWEENEY—Sonoma and Mendocino Cos.

CAPT. JAMES B. EADS has been purchasing mining machinery in Denver, Colorado, for El Bancos Mining Co., Durango, Mexico.

## List of U. S. Patents for Pacific Coast Inventors.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 252 Market St., S. F.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING OCTOBER 19, 1886.

- 351,087.—SPRAYING NOZZLE—John Bean, Los Gatos, Cal.  
351,088.—SPRAYING PUMP—John Bean, Los Gatos, Cal.  
351,154.—PLOW—J. A. Bilz, Pleasanton, Cal.  
351,092.—CLOTH WINDER—A. Brown, Mendocino, Cal.  
351,309.—PRINTING PRESS GAGE—F. F. Byington, Oakland, Cal.  
351,102.—PANTS HANGER—A. Fieger, Portland, Or.  
351,104.—HAY PRESS—E. Gallagher, Bodie, Cal.  
351,028.—GANG HOE—F. T. Gilbert, Walla Walla, W. T.  
351,105.—SYRINGE BOTTLE—N. S. Hamlin, Marysville, Cal.  
351,266.—BLOTTER—A. S. Johnson, Sprague, W. T.  
351,062.—WASHING MACHINE—B. F. Mathews, San Bernardino, Cal.  
351,119.—GATE—M. C. Meeker, Occidental, Cal.  
351,337.—GATE—C. E. Plumley, Byron, Cal.  
351,209.—TELEPHONE—Paul Seiler, S. F.  
351,350.—VEHICLE RUNNING GEAR—John Zeek, Canby, Or.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LIFTING-JACK.—Melvin C. Meeker, Occidental, Sonoma Co. No. 350,597. Dated Oct. 12, 1886. This is a jack such as is used for lifting and logging purposes. The object is to provide a simple and effective jack, in the operation of which but a small exercise of power is required, and this patented construction of devices accomplishes this.

GATE.—Chas. E. Plumley, Byron, Contra Costa Co. No. 351,337. Dated Oct. 19, 1886. The invention relates to that class of gates which are adapted to be readily opened or closed by the traveler without alighting from his vehicle. By peculiar construction and combination of devices the inventor provides a simple and readily operating gate of this class.

SYRINGE BOTTLE.—N. S. Hamlin, Marysville, No. 351,105. Dated Oct. 19, 1886. This new syringe bottle consists in a bottle having a neck-opening in its side and a removable elastic band covering said opening and encircling the bottle. The object is to provide a bottle the neck-opening of which can be easily and tightly closed by means of an elastic band, and which is also readily removable for the insertion of the point of the syringe.

PLOW.—John A. Bilz, Pleasanton, Alameda Co. No. 351,154. Dated Oct. 19, 1886. This is an improvement in gang plows. The object is to provide a plow which is specially adapted for use in orchards and vineyards, where the plowing must be done close to the trees and yet not injure them. A peculiar bend in the beam enables the inventor to place two plows on a single beam, and by coupling the whiffletree the center draft can still be obtained, no matter how close the plow may be running to the trees or vines.

GATE.—Melom C. Meeker, Occidental, Sonoma Co. No. 351,119. Dated Oct. 19, 1886. This is a gate which is opened or closed by the traveler without having to get out of his wagon. The invention consists in the peculiar bearing-plate or casting adapted to be readily bolted to the bottom of the gate, near its hinge end, the bent lever pivoted to the casting and guided and limited thereby, the operating levers in the roadway and their connections with the pivoted bent lever, the connections between said bent lever and the gate-latch, and the arrangement of the latch itself and its construction, whereby it is caught and released. These attachments can be easily and effectively applied to any gate.

HAY PRESS.—Eugene Gallagher, Bodie, Mono Co., assignor of one-half to Morten Anderson. No. 351,104. Dated Oct. 19, 1886. The invention relates to that class of baling presses in which a reciprocating follower works within a single double-ended chamber whereby a bale is pressed upon each stroke of the follower, the feeding of one bale taking place during the completion of the other. The invention consists in the chamber having a discharge at each end, the reciprocating follower in said chamber, the novel means for operating the follower, the arrangement of feed and discharge doors and their fastenings, the means for automatically passing the bales and releasing them, and various details of construction.

WRENCH.—Wm. J. Palleam, Chico, assignor of one-half to Allen Henry and A. M. Barley. No. 350,602. Dated Oct. 12, 1886. This is a wrench specially adapted for adjusting the nuts

on the teeth of thrashing cylinders. The invention consists in a short stock for entering the cylinder, a handled shank pivoted in said stock and projecting outwardly between the cylinder-bars, a socketed piece or jaw pivoted on the stock for engaging the nut from within, gears by which the rotation of the shank is transmitted to the socketed piece or jaw, a clamp on the stock for engaging one of the cylinder-bars, and holding the stock steady, and a jaw or holder on the shank for engaging the tooth and keeping it from turning. This device will tighten or loosen nuts, securing teeth of a thrashing cylinder without having to reverse the cylinder.

LOUR-CHEST.—Joseph Ozenberger, Middletown, Lake Co., assignor of one-half to R. H. Sanders. No. 350,600. Dated Oct. 12, 1886. This flour-chest consists in a casing having within its back portion, and arranged vertically, a flour compartment, and in its front portion an endless traveling elevator communicating at its lower end with the lower end of the flour compartment, a sifter into which the elevator discharges, a removable bread-board closing the upper front portion of the casing, a suitable arrangement of shelves in the lower front portion of the casing, and a small drawer-sieve, together with mechanism for operating the elevator and sifter, and various details of construction. The object is to provide a flour-chest the parts of which are so arranged that the greatest convenience can be obtained in the use of the chest.

It is stated that in Butte, Montana, a new railroad company has been started with sufficient capital to build lines to all the principal mining camps.

D. W. Stone,

Who mined at Murphy's Camp in 1882 and at Sonora in 1885, will please address, G. A. GELIEN, VALLEJO, CAL.; very important.

## Assessment Notices.

Acme Mill and Mining Company.—Location of principal place of business, San Francisco, Cal. Location of works, Volcano Mining District, Amador County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 25th day of October, 1886, an assessment (No. 9) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Sec'y. Office—Room 4, 309 California St., San Francisco, Cal.

Aultman Mill and Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Georgetown Mining District, El Dorado County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 26th day of October, 1886, an assessment (No. 3) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Sec'y. Office—Room 4, 309 California St., San Francisco, Cal.

Santa Anita Mill and Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Nevada County, Cal.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 26th day of October, 1886, an assessment (No. 10) of one and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Sec'y. Office—Room 4, 309 California St., San Francisco, Cal.

## HENDERSON'S PATENT TRUSS

Comfortable and Reliable.

This simple truss can be worn without inconvenience, and gives all the comfort to the wearer that can be obtained from a perfect-fitting, pliable apparatus. The pad is soft and yielding, and on account of its peculiar construction and the connections of its securing bands, cannot get out of place. It will remain in place no matter what position the wearer may assume. The engraving shows the construction of the appliance. It is simplicity itself, and is comfortable and reliable. Address, JESSE G. HENDERSON, Grizzly Flat, El Dorado Co., Cal.

HEALD'S BUSINESS COLLEGE, 24 Post St. S. F. Send for Circular.

## Books on Assaying.

By C. H. AARON.

## PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

## Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Chugging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 252 Market street, San Francisco.

## PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

## Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & Co., Publishers, No. 252 Market St., S. F.

## Testing and Working Silver Ores.

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protoclauride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patches' process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroebe's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by DEWEY & Co., Publishers, 252 Market St.

## Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 154 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit by an author whose reputation is unsurpassed in his specialty. PRICE, \$3, cloth, postage free. Sold by DEWEY & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F.

## American Exchange Hotel, SANSOME STREET.

Opposite Wells, Fargo & Co.'s Express, one door from Bank of California, SAN FRANCISCO.

This Hotel is in the very center of the business portion of the city. The traveling public will find this to be the most convenient as well as the most comfortable and respectable Family Hotel in the city.

Board and Room, \$1.00, \$1.25 and \$1.50 PER DAY, ACCORDING TO ROOM.

Hot and Cold Baths Free. None but most obliging white labor employed. Free Coach to and from the Hotel.

MONTGOMERY BROS., Proprietors.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

**MINING MACHINERY.**

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

### WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

### BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE OF CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

## A New Concentrator.

We saw in operation this week, in this city, a new concentrating appliance devised by W. C. Stiles, who is known also as the inventor of quartz-crushing machinery and similar appliances for mining purposes. The new concentrator is quite simple in construction and operation. It is built on the well-known principle that when a vessel containing gold, sulphurets, quicksilver, etc., is shaken, the heavier valuable material will settle and the sands and gangue will come to the surface. As the heavier material settles the lighter sands are carried off by flowing water. The concentrator is an inclined surface having at stated intervals transverse depressions with long downward incline and short upward incline. This makes a series of inclined planes. Each of these has a pitch of one-half inch in one foot toward the head, where it is met by an incline six inches long, one and one-half inches in height. This incline is the beginning of another of one foot, pitching one-half inch toward the head, as before. Then follows another, and so on, there being from 4 to 10 inclines as best suits the concentration.

The table is given an end shake, and brings up with a jar or shock. The material if constantly jarred would settle very hard. To avoid this there is an automatic rake or series of levers traveling up and down the entire length of the vibrating table. When the levers are going toward the upper end they are plunged into the sands in the different inclines, and when going back or down the table, they are raised out so as not to touch the material. When they are on the inclines that pitch to the upper end they nearly touch the bottom. After reaching the six-inch inclines the rake rises, dragging a portion of the concentrated material up to plane No. 2 and so on to No. 3 and No. 4 up to the topmost riffle, where the concentrates are carried off into a box. The tailings pass off at the lower end. Trials are now being made with the machine to prove its efficiency, and so far the results are satisfactory to the inventor.

THE Rio Tinto Company reports to its shareholders that its "total delivery of pyrites for the year will be about 350,000 tons, or the same as in 1885. The production of copper at the mines is fully maintained at last year's rate, and, owing to the improvements in the working, the cost price has been further reduced. The continuous fall of copper, the price of which has been considerably below last year's average, has, however, swallowed up more than the results of economy and cheaper production."

## Robinson District, Nevada.

Robinson district, White Pine county, Nevada, is not a new camp, having been originally opened many years since. It has, however, been in idleness a long time, though efforts are now being made to work some of the mines again. The location is said to be a pleasant one, and the claims can be worked the year round. Wood is abundant at \$3 per cord, and charcoal is 15 cents per bushel. The Hamilton and Eureka stages pass through the neighbor-

paying proposition. Efforts are now being made in this city to raise capital for reduction works in the camp and the prosecution of developments in the claim.

A MINING EXPERT'S FEE.—A complaint has been filed in the Superior Court in which Chas. Kaufman alleges that in May, 1880, Frank F. Obiston and Isaac M. Taylor employed him as a mining engineer to examine and make his report on a certain property situated in Gold Mountain Mining District, in Nevada, known

THE NATIONAL ROCKER QUARTZ MILL.

## Another New Quartz Mill.

A representative of the MINING AND SCIENTIFIC PRESS witnessed this week a trial of the new "National Rocker" quartz mill, manufactured by Marshutz & Cantrell, of the National Iron Works in this city. The mill was invented by Stephen Kendall, who got up the one-stamp mill several years ago. We give an engraving of the new machine on this page. It is quite simple in construction, as may be seen. The mortar is semi-circular and rests on rack bars on the timbers, so that it will, when in motion, maintain its relative position with the lever. Secured to its bottom, outside, is a lever, which is connected by a rod to the crank, so that motion may be given, by a steam engine or other suitable power.

Inside the mortar, which is fitted with removable dies, is a large roller, this roller having a circular slot in its center. A central rib fits in this slot so that the roller cannot slide from side to side, but is kept in direct line with the movement of the mortar.

The mortar has a double discharge, there being screens in each side.

The mortar is given a rocking motion and as it rocks the roller moves back and forth over the shoes, going first up one side and then up the other, and in its passage back and forth it crushes the quartz which is beneath it. There is no time when the roller is not in contact with the quartz in the shoes, so that it is doing its work all the time.

The natural swash of the water in the battery serves to keep the screens clear, and the mill is said to save a very large percentage of

the gold in the mortar. One of these machines with all iron work complete, including counter shaft, boxes, pully, crank and connecting rod, weighs 5300 lbs; and the cost of the same capacity is said to be less than one-third of stamps. The wear is only in the shoes and dies. Comparatively little power serves to operate this rocking mill.

At the trials this week in this city before a number of mining men, several lots of hard, clear quartz were crushed. One lot of 500 pounds went through in 25 minutes; another of 500 pounds in 31 minutes; another of 1000 pounds was crushed in a little less than an hour, ordinary gold ore screens being used.

We are informed that a mill of this kind will crush from 10 to 15 tons per day. One has been in operation at Angels' Camp, Calaveras county, for some little time, and has been visited by hundreds of miners, who speak of it with commendation. It is specially adapted for miners who have mines they are working themselves, on account of its comparatively small cost and the small power required to run it. The price complete, without frame, is \$500.

ing valley three times a week. The postoffice, at Ely, is three miles distant. The roads to Eureka are good.

We are informed by a miner who has recently spent some little time in the district that there are several claims which show bodies of mineral assaying from \$10 to \$500 per ton. The ore carries lead, silver and gold, and there is also some copper. The low-grade lead ores carrying silver are the most attractive. Ores assayed from the Ontario mine run from 37 to 66 per cent lead, and from \$8.24 to 40 ounces silver per ton, with some little gold. A proposition is now being made to put up a crusher, mill, concentrator, etc., capable of treating 100 tons of ore per day. The Ontario, Arthur, Great Western, West Altman and Roadside mines are mentioned as promising ones, but a water-jacket smelter is needed for some of the ores.

In 1873, when the camp was better known than now, the Ontario was valued at \$500,000, but under the then existing conditions it did not pay. Now, however, with increased knowledge of working the ore, and better facilities, the mine is represented as being a good

as the Stewart mine, they agreeing to pay him for such examination the sum of \$2500. In accordance with this agreement, Kaufman examined and reported upon the mine, and in September, 1880, the defendants sold the property to George D. Roberts for \$40,000. Since then, Kaufman says, defendants have refused to pay him the commission, wherefore he sues to recover \$3500, with interest thereon at seven per cent per annum from the 30th of September, 1880.

SHIPMENTS of specie from San Francisco by sea from January 1st to November 1st were \$16,135,200 against \$16,670,800 during the same period last year. Of this year's shipments nearly half, or \$7,535,000, went to China. Last year over half, or \$10,450,000, went to China.

THE Amador Canal Company's supply of water at the Blue Lakes fell short of the demand this year, the lakes being drained some time since. Considerable work will be put on the lakes next summer to increase their capacity.

## CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

## Float Gold.

EDITORS PRESS:—The laws that regulate metallic solutions, suspensions and chemical combinations, if examined, point to certain phenomena highly interesting and important.

These laws go to show that when precipitants are used to throw down a metal in solution, there is sufficient force left to form suspension compounds.

Research of modern investigations has proved in actual practice, guided by these theoretical considerations, the importance of these laws that lead to the solution of the float metal question. It is also now considered that solutions, suspensions and chemical combinations are manifestations of the same force and definite chemical compounds; such being the case, it is not difficult to arrive at some definite conclusions highly important to the chemical arts. This has already been done with results which promise to terminate the great wastage of the precious metal now floating away in many mining operations.

To effect this, some agent possessing a stronger attraction for the metals than water was required. This quality was found—possessed in the hydrocarbons and also the saponified oleaginous bodies; the first has strong reducing properties; the latter highly basic. To render the matter clear for practical purposes, an example is cited which will also help to explain the principles involved.

Water carrying gold and silver in suspension is deprived of its silicious and earthy matter as far as possible. A small quantity of any of the saponified oils or fats are allowed to mingle with it, which will coagulate. This decomposition causes a change of base; the metallic fatty matter separates and is taken up by passing the water containing the coagulum through a bath of the hydrocarbons or petroleum, which retains the metal, and is then refined in the ordinary way to obtain the gold and silver.

There are in operation a number of filters placed at the tail-end of jewelry factories, saving gold and silver that otherwise would have been lost; in these cases the saponified matter already exists and the mechanical arrangements are quite simple.

In conclusion it may be stated that this patented process has the following advantages: Gold and silver are withdrawn from water containing one cent in 25 gallons, which pays when in quantities, as the cost of manipulation is quite small; it also suggests that the great waste now going on in our large mining operations may be prevented, and much of our national wealth saved.

The above question has occupied the attention of mining metallurgists a long time; they have demonstrated by actual assay the heavy loss of float gold in our streams, while silver and quicksilver share the same fate. It must be borne in mind, in cases above cited, that quicksilver totally fails to act, while the new agent continues the operation by increase of force. Many of the hydrocarbons act far more energetically by withdrawing gold from its solutions than when precipitants are used.

JOHN TUNBRIDGE.

Newark, N. J.

FINE SILVER MARKET IN OCTOBER.—There was a good demand for fine silver last month at the leading centers, which are San Francisco, New York and London. The market was generally a rising one. The changes at London were called as follows:

October 1.....44 3/16d	October 21.....45 3/16d
October 6.....44 10/16	October 22.....45 4/16
October 7.....44 11/16	October 23.....45 5/16
October 14.....44 15/16	October 25.....45 7/16
October 18.....45 2/16	October 26.....45 8/16
October 14.....45 4/16	October 27.....45 11/16
October 19.....45 1/16	October 28.....45 12/16
October 20.....45 2/16	October 29.....45 14/16

The appreciation for the month amounts to 13d per ounce. In July the price declined from 45gd to 42d. This was the lowest price known for 50 years or more. In August there was an advance of 3d, and in September a further advance of 2d. This has now been followed by a further advance of 13d in October, making a net gain of 34d from the lowest price last July. Of course, some of this gain is due to the increased demand incident to the approaching end of the year, when balances are settled. On the 3d the price was 46d.

DISTRIBUTION OF RAILROADS.—If the average reader were to be asked to name that State of the Union which can show the longest railroad mileage, he would in all probability designate New York or Pennsylvania. But he would be mistaken. Of all the States, Illinois heads the list with 18,904 miles of railway, while far behind come Pennsylvania with 7,767 miles, Iowa with 7,503, New York with 7,385 miles, and Ohio with 7,327 miles. Texas comes next with 6,687 miles. Of all others, Indiana and Michigan alone have over 5,000 miles, while Wisconsin, Missouri, Kansas and Minnesota have over 4,000, and Georgia and California have over 3,000.

THE LEGISLATURE OF THE STATE OF SONORA, Mexico, has exempted from all municipal taxation any ice factories that are or may be established within the State.

## The Minting of Gold and Silver.\*

NUMBER I.

(By ALBERT WILLIAMS, JR.)

A description of the means by which gold and silver are refined and made into coin forms a natural sequence to the description of the mining and metallurgical methods. The following notes are designed to present merely a brief outline of the subject for the benefit of readers who may be unfamiliar with it. An exhaustive treatise on modern practice is much to be desired, but such a dissertation does not come within the scope of the census work. Two mints were selected for examination—that at Carson, Nevada, and that at San Francisco, California. The processes employed at these two establishments are, in the main, identical, though conducted upon an altogether different scale; and to avoid wearisome repetition of details the description of the system at the San Francisco mint is confined, so far as practicable, to the salient divergencies from the methods pursued at the smaller mint. Both mints now part by sulphuric acid, the nitric-acid process (formerly in exclusive use at the San Francisco mint) having been in large part supplanted by the cheaper sulphuric-acid process. In each case the officers extended every facility for inspection, and to them, and to all the employees, the writer is indebted for many courtesies.

United States Mint at Carson, Ormsby County, Nevada.

The Carson mint, though much smaller and having far less working capacity than the similar establishments at San Francisco and Philadelphia, is nevertheless a fully-equipped mint, capable of meeting all ordinary requirements, and performing its work in an excellent manner. It was projected with a view of facilitating the minting of bullion from the Comstock mines, but for reasons unconnected with the simple question of proximity the greater part of the Comstock product has been treated at the San Francisco mint. The Carson mint having but slight, if any, advantages over its San Francisco rival in point of transportation from other mining districts, has, therefore, except during exceptional periods of activity, been limited in its operations to even less than its actual capacity, and at times has been shut down for months. This was the case during a large part of the census year. The examination was made in January, 1881.

## Location and Railroad Connections.

The site of the mint comprises a block on the west side of C street, Carson, one block south from the station of the Virginia & Truckee railroad. The mines of the Comstock and neighboring groups are distant from 20 to 25 miles, while the mills along the Carson river are at nearer intervals. From Virginia City to Carson by rail the distance is 21.1 miles. At Reno, 31.1 miles distant by rail from Carson, the Virginia & Truckee railroad connects with the Central Pacific railroad, thus bringing the mint into communication with the mining districts within reach of the latter road.

## The Building.

The main building, designed by Mr. A. B. Mullett, then supervising architect of the Treasury Department, was completed in January, 1870, at a total cost of \$160,000. It consists of two stories and a basement, the first floor being 15 feet high and the second story 14 feet. The area covered is 90 feet 6 inches by 59 feet 10 inches. The basement contains the annealing-room, cutting-room, grinding-room, hydraulic presses, drying furnaces, Chili mills, vaults, storerooms and closets, and through it run the counter-shafts, with the pulleys driving the machinery on the first floor. The engine and boiler rooms are immediately in the rear and on the basement level. On the first floor are the weighing-room, deposit-melting and ingot-melting furnaces, ingot-rolls, whitening-room, coining presses, machine-shop, offices of the cashier, coiner, and melter and refiner, and vaults. The second story is occupied by the superintendent's, assayer's and chief clerk's offices, the laboratory, assay-room, humid assay-room, refinery and adjusting rooms.

The walls are a rough-dressed freestone from the quarry of the Nevada State Penitentiary, 1½ miles distant—a handsome building-stone, which is said to become indurated by exposure. Granite quarried ¾ miles from the site is used for the stairs. The shutters are of iron.

An extension in the rear of the main building, of the same general construction and appearance as the latter, and designed to contain the refinery (which was hampered for want of room in its original position), was unfinished at the date of examination. The first appropriation of \$8500 having been exhausted, a further sum of \$5000 would be required to complete this extension. There are five vaults in the main building provided with combination locks.

## Machinery, Etc.

The machinery, appliances and fittings, which will be described somewhat in detail, are of recent type throughout, and are well adapted to their several purposes. Their total cost, including alterations and repairs, is stated to have been, in round numbers, \$100,000.

\*From the census report on the "Statistics and Technology of the Precious Metals," by S. F. Emmons and G. F. Becker, special agents. The description of the mints and the processes applies to the year 1881, at which time the mints were examined.

## Cost.

The total cost of construction and equipment of the mint, inclusive of the additional appropriation required, was:

Main building.....	\$160,000
Extension.....	8,500
To complete extension.....	5,000
Machinery, fittings, etc.....	100,000
Total.....	\$273,500

This may be assumed as representing the cost of a first-class mint of moderate capacity.

## Organization.

The work of the mint is, for convenience and as a precaution against loss or error, divided among four distinct departments, which are designated as: *a*, the general department, under the immediate and special charge of the superintendent; *b*, the assayer's department; *c*, the melter and refiner; and, *d*, the coiner. These form separate corps, working independently, but accounting to each other. Over the whole the superintendent has, of course, supervision.

## Mint Terms.

Gold bullion and dust are deposited, and returns made to the depositors in coin after minting, the gold coinage being free. Silver bullion is purchased at the market price, governed by the daily London quotations, with allowance for variation in exchange. The bullion purchased is 0.500 fine and over, at the discretion of the superintendent. Although the Carson mint has been described as a complete one, there are still a few slight improvements which might be advantageously added. Among these are: *a*, A reverberatory cupel furnace, for treating bullion containing a large proportion of lead. At present (1881) the mint is carrying over from year to year bars which cannot be termed base, but which cannot be profitably refined by the sulphuric-acid process. As an average example of this class of bullion, the assay determination of bar No. 92, cast in 1879, is appended: Gold, 0.021; silver, 0.535; lead, 0.444. *b*, Dust-chambers, or condensing-flues connected with the main stack. Although the loss of precious metal is small, it could be still further reduced by these means. *c*, Improved sulphuric acid condensers in the refinery.

In describing the operations of the mint in detail, the natural sequence of the several manipulations will be observed, so far as is practicable, beginning with the receipt of the precious metals in their crude state, and then following them through the processes of melting, refining into mint-fine metal, alloying to the coin standard, casting the coin metal into ingots, rolling the ingots to the required thickness, annealing, cutting into planchets, adjusting to proper weight, milling, whitening, and finally minting into standard coin. Besides these processes, the checks against loss, the driving power, the amount of work done, value of supplies consumed and labor expended, with subsidiary details, will also be considered.

## Weighing-Room.

The gold deposits, silver purchases and re-torted amalgam are here received and weighed in the crude state. The weights, in connection with the assay of samples from the deposit-melting room, form a basis for action by the superintendent. This room is on the first floor, at the left of the main entrance, and is in charge of the weigh clerk and assistant weigh clerk, who form the total force. It is included in the general department, which is responsible for all bullion until the latter is formally transmitted to the melter and refiner and accepted by him in the ingot-melting room.

Scales.—The weighing is done on a large pair of Troemner bullion scales, made expressly for the mint. Their capacity is from 0.01 ounce to 6000 ounces. The center knife-edge is chilled steel or agate bearings, and the knife-edges at each end of the beam are agate on agate. There are no beam riders. Adjustment for wear and tear is secured by filing or removing rings of copper wire, which are hung on pendants.

## Deposit-Melting Room.

From the weighing-room the crude bullion goes to the deposit-melting room, where it is melted and samples are taken for the assayer. This room is on the first floor at the middle of the south side of the main building, is 18 feet 3 inches by 14 feet 10 inches in size, and is in charge of the deposit melter and his assistant. It is included in the superintendent's special department.

Furnaces.—There are three melting furnaces in the room of the same general type. Two of these have heavy cast-iron shells, frames and doors, and are lined with fire-brick; they are 18 inches square, inside measurement, 16 inches deep in front, and 30 inches deep at the back, with level grates. The iron sliding doors at the top are sharply inclined, sloping downward from the back. The flue from each is 7 by 9 inches, and leads to the main stack. The smaller furnace is similar in construction, but has a sheet-iron shell. It is 13 inches square, 16 inches deep in front, and 27 inches deep in the rear, and its flue, 5 by 6 inches, leads to a separate small chimney. The grate-bars of each furnace are 1 inch wide, with spaces of five-eighths of an inch intervening.

Fuel.—If several melts are to be made in succession, Lehigh anthracite and nut-pine charcoal mixed are used. For a single melt the fire is made of charcoal only.

Crucibles.—Graphite, French clay and sand crucibles are used. The series of sizes of graphite crucibles employed includes Nos. 8, 12, 20, 35, 90, 100 and 150. With bullion of the average fineness received, the working ca-

capacity of each size is as follows, the weight of the crude charge, exclusive of flux, being given:

	Ounces.
No. 8 crucible.....	200
No. 12 crucible.....	250 to 300
No. 20 crucible.....	400
No. 35 crucible.....	1,300
No. 90 crucible.....	2,000 to 2,500
No. 100 crucible.....	3,500
No. 150 crucible.....	6,000

These figures are for charges conveniently melted in crucibles of the respective sizes, and do not represent the extreme holding capacity. It should also be observed that the several working capacities are not in direct ratio with the series of designating numbers. The life of graphite crucibles varies from 15 to 20 melts, according to the character of the bullion treated. If there is much lead in the bullion, the crucibles are more rapidly corroded than if an equivalent percentage of other base metal were present. The stirrers are of the same material as the crucibles—graphite and clay mixed. Sand crucibles of small size are employed for melting assay grains belonging to each deposit or purchase, and are broken after having been once used. The French crucibles are second-hand ones from the assay department, and are used, merely as a matter of economy, for the same purpose as the sand crucibles. Like the latter, they are destroyed after one firing.

Loss of weight in melting.—With fairly clean bars the loss of weight ranges from five to fourteen one-hundredths of one per cent, and with well-retorted amalgam the loss is from one-half of one per cent to one per cent.

Fluxes.—The fluxes added to the charge of crude bullion in the melting pots are: *a*, Borax, invariably. *b*, Sodium bicarbonate, if retorted amalgam is being melted. *c*, Potassium nitrate, if iron or carbonaceous matter is present in the bullion. *d*, Bone-ash, to thicken the slag so that it may be easily skimmed off. *e*, Phosphorus, in quantities not exceeding one-half ounce to a melt of 1800 ounces, in case the bullion contains much copper. *f*, Corrosive sublimate, with bullion containing much lead or antimony.

With fine bars the surface of the melt is protected from the air and volatilization of silver prevented, should the melt become overheated, by sprinkling upon it powdered charcoal sifted through a No. 60 screen.

Molds.—The crude metal sent from the deposit-melting room to the refinery is cast into bars of a peculiar shape termed "shoe-bars." The shoe-bar mold is a parallelogram slightly contracted at each end and having two transverse ribs or semi-partitions, which rise to a little more than one-half the thickness of the metal cast, thus producing a bar which is deeply indented transversely in two places and can readily be broken into three nearly equal portions, for convenience and greater rapidity in dissolving. The molds are 15 inches long, 3½ inches wide at the center, and 1¾ inches deep (interior dimensions). With bullion obtaining 40 per cent in value of gold, the shoe-bars average 200 ounces in weight. The range is from 170 to 220 ounces. Smaller rectangular molds are used for casting assay bars and small quantities of bullion.

Sampling.—The deposit melter takes two samples of each gold deposit or silver purchase. With gold deposits diagonal corner chips are taken from the bar, the chips together weighing forty one-hundredths of an ounce. If the gold melt is large, making several shoe-bars, a pair of diagonal corner chips are taken from the first and from the last bar of the melt.

With small melts of silver or dore metal two dips are taken directly from the melting pot and granulated, the two granulation samples weighing from twenty to sixty one-hundredths of an ounce. In case of large melts of silver or dore metal granulations are taken from the top and the bottom of the charge by dipping 200 ounces from the melting pot, pouring off all but a few ounces from the dipping cup, and granulating 1½ ounces in cold water. The pair of granulation samples sent to the assayer weigh from twenty to sixty one-hundredths of an ounce.

In each instance a careful system of designating the samples and stamping the corresponding bars is observed, so that the assay determinations in connection with the weights give exact data for the guidance of the superintendent and the melter and refiner.

SODA WORKS AT OWEN LAKE.—A force of 35 men and 5 teams are employed in excavating vats for the evaporation of the waters of Owen lake for the production of soda. These vats now cover an area of over 10 acres. About 75 tons of crude soda have crystallized this season, although it is not considered that even a commencement has yet been made. These cakes or crystals, taken from the bottom of the vats, are said to go 90 per cent soda. This material has yet to be "furnaced" before it is in a marketable condition. By another season a furnace for this purpose will be built on the ground. This evaporation process cannot be advantageously carried on during the winter months. The work of preparing vats is to be pushed right along until the entire shore of the lake is lined with them. While the enterprise is yet in its infancy, it has, in all its departments, advanced beyond the experimental stage and may be set down as an established enterprise, and one certain to prove of material importance to the business interests of Inyo county.—*Virginia Chronicle*.

MORTAR and paint may be removed from window glass with hot, sharp vinegar.

## California Savings Banks.

The Bank Commissioners on Silver in this State.

The report of the Bank Commissioners of the State of California, W. F. White, W. W. Moreland and A. W. Potts, is an exhaustive and complete statement of the condition of every bank in the State, a report of 420 pages, neatly printed and handsomely bound.

Their report shows that 22 savings banks in the State under their charge hold in their keeping \$63,000,000, almost wholly the hard earnings of the working people, while the deposits in the 74 commercial banks reach only about \$40,500,000. The present law requires that each bank shall be examined twice a year. This the commission finds to be utterly impossible, for in some cases where the banks do a large business it takes a whole week to critically examine all the details of the business. They give a detailed description of how they conduct an examination.

They say: We discourage the loaning of money to flouring mills, lumber mills, and all sorts of enterprises, such as fruit-canning corporations and the like, without demanding ample security for the money loaned. And it is a curious fact that so far our advice in this respect, when disregarded, has always resulted in a loss to the bank, sometimes sweeping away its whole reserve, and in some instances even impairing its capital as well. We do all we can to discourage and prevent the officers and directors of banks from loaning the bank's money to each other. The practice is bad in itself and liable to abuse that is almost criminal. We sometimes find officers and directors of a bank partners in some extensive enterprise of great apparent usefulness to the locality in which the bank is doing business, influencing the board of directors of the bank to make large loans to this favorite enterprise without requiring security that is absolutely and beyond all doubt good. This is all wrong, and generally ends in disaster to the bank. Nine out of every ten banks that fail do so from abuse in this direction, and the stockholders of a bank cannot be too watchful of the action of their officers and directors in this respect.

It may be of interest to state that in our examinations, as a rule, we now find much more currency than formerly in the banks. This is particularly so in the southern counties of the State. The marked change in this respect is undoubtedly owing to a large Eastern emigration that for the last four years has been flowing into those counties.

The prejudice in California against the use of paper money is still very strong, but undoubtedly modified.

The silver standard dollar seems every day to increase in popularity in our State. The country banks find the unabated demand for it hard to meet. Most of them receive from \$1000 to \$3000 a week from the sub-treasury in San Francisco, the expense of the transfer being paid by the General Government. This rapidly goes into circulation and disappears no one knows where, as it never returns to the banks. It seems to remain among the people as a necessary medium of trade. We find, by our investigation on this point, that it does not return to the city through the agencies of the country merchant, for they do not pay their bills in San Francisco in silver. They seldom send a dollar of silver to the city, either to liquidate their debts or purchase new goods. All this is done by drafts on the city banks, or with gold and currency sent through the postoffice or express. The only two avenues by which the silver dollar seems to find its way back to the city are through the settlements made by the country postoffices with the main postoffice in San Francisco, and the settlements made with various railroad stations throughout the State and the head office in San Francisco. But through these avenues cannot be traced one-fifth of the amount constantly streaming into the interior of the State through the local country banks.

There never was a proposition so unanimously unpopular with the people of California as that proposing to stop the coinage of the silver dollar.

The fight so bitterly waged by Eastern money-dealers against silver has had the effect in our State of keeping our large city banks in a constant state of alarm, lest they might be caught with a depreciated currency in their vaults. The consequence is that, though disapproving of this anti-silver crusade, they are yet forced, as it were, to take part in it in a quiet way, by avoiding silver as much as it is possible. It seems plain that if the anti-silver war in the Eastern States was decidedly discouraged by our Government, it would soon cease, and there would be but little further trouble in the continued coinage of silver.

MECHANICS' INSTITUTE.—The Board of Trustees of the Mechanics' Institute met last week, P. B. Cornwall presiding. The time of the meeting was occupied in hearing the reports of the different committees in connection with the recent industrial exhibition. The report of the Committee on Finance showed that the receipts from all sources amounted to \$45,064.62, and the expenditures to \$23,539.85, leaving a balance of \$21,524.77. The reports will be embodied in the published report of the fair.

## Honduras Mines.

A reporter of the Eureka Sentinel has had an interesting conversation with Frank Robbins, formerly superintendent of the Eureka Con. and other mining properties in that district, concerning Honduras, Central America. Mr. Robbins is superintendent of some valuable mines in that country belonging to a New York syndicate of capitalists, and having come to San Francisco to purchase machinery, he decided on a visit of a couple of days to his old stamping-grounds on the Range. The following information gleaned from Mr. Robbins' remarks will undoubtedly prove of interest: The population of Honduras is about 400,000; the two principal towns are Tegucigalpa (meaning Silver mountain), the capital, populated by some 12,000 people, and Camagua, with probably 10,000. The latter was until recent years the capital of the Republic, and both contain many handsome churches, universities, residences and other structures. The ports on the Caribbean sea, or north coast, are Puerto Cortez and Truxillo, both of which have fine harbors. Two lines of steamers run to these ports from New Orleans. On the south coast there is but one port, which is on the Bay of Fonseca. It is at the island Isla del Tigre, and is named Amapala. Supplies from San Francisco, Panama and Germany are transferred from vessels at Amapala to barges that run up the Bay of Fonseca to the two principal landing places, San Lorenzo and La Brea. From there they are transported by teams or pack animals, according to the season and condition of the roads, to Tegucigalpa, a distance of 75 miles, and other interior towns. From the north coast inland for about 60 miles, and from the Bay of Fonseca, on the south, a probable distance of 10 miles, the country is rather flat, hot, and full of mosquitoes. Beautiful orchards of tropical fruits of all kinds are to be found there, also tropical grains, such as coffee. The mountains ascend gradually from the plains and are covered with pines and vegetation. In many respects they remind the traveler of portions of the Sierras on the California side. The valleys and plateaus at an altitude are very productive, and will grow anything, from potatoes to pineapples. The climate there is healthful and equable, the thermometer ranging the year around from 75 to 85° in the shade. There are two seasons only, the wet and the dry. The former commences about the 1st of May and continues until the latter part of October. The rains fall in heavy showers, and generally during afternoons.

The syndicate Mr. Robbins represents holds valuable concessions from the Government, in order to encourage their large operations. Quite a number of foreigners are operating there extensively with improved machinery, but the majority of the mines are owned and worked by natives, whose processes are not so crude as they are small. Many of the companies are paying good dividends, but no definite results of the amounts produced annually can be learned. The archives of the country show that before it became a Republic in 1821, the royalty of one-fifth of the production paid to the King of Spain aggregated up into billions of dollars. An immense and grand cathedral in Tegucigalpa was built entirely at the expense of a priest from the proceeds of a mine that he, individually, owned.

While the soil of the country is very productive and in many places excellent for grazing, the chief interest thus far is mining. The principal sections where this industry is carried on are Yora, Santa Barbara and Orlandio, where gold quartz ledges and placers predominate, and at Comayagua, Tegucigalpa and Pariso are found gold, silver, copper and lead. The country is generally of a volcanic character, and ledges and veins of all sizes and richness are found.

The accommodations for traveling through the Republic are poor, but Mr. Robbins says before long a railroad will be constructed from Puerto Cortez on the north coast to the Bay of Fonseca on the south that will connect as closely as possible with the richest interior sections of the country through which it passes. He does not advise impecunious miners or other classes to go there at present, unless it be to enter a guaranteed position. All such, he says, are fortunate, for he believes the country has a great future. There is every indication of it.

THE RAILROAD TO OREGON.—The railroad workers are gradually pushing the work along from Strawberry valley, where the track will be completed, to the new town of Sisson, to-day or to-morrow. If three weeks more of good weather prevails, the track will be completed to Butteville, and by New Year's it will be finished to the vicinity of Yreka, as work can be carried on rapidly after reaching Butteville. The road will run across the Edson ranch, and may yet come through Yreka, if our citizens will make an effort to secure the main line. Our farmers, stock-raisers and producers generally in this county will no doubt be able to sell a large amount of grain, hay and all kinds of home products to the railroad this winter and next summer, while the railroad work progresses. A great quantity of produce has already been hauled to railroad camps during the past summer, and even during last winter, but from now on to completion at Oregon boundary, there is no reason why all the farm supplies cannot be furnished by Siskiyou county.—Yreka Journal.

## Sacramento's Railroad Shops.

The railroad shops now present a busy scene. Work necessary for the extension of the California & Oregon railroad and other lines by the Southern Pacific Company has given to the shops a lively appearance. In every department all the machinery is in full running order. More men are working now than have been since the great lay-off two years ago, when hundreds of employees were let out. It is estimated that over 2000 persons are employed by the Southern Pacific Company in Sacramento.

The most interesting part of the railroad works is the shops in which iron is manufactured into various forms. Old scrap iron, which has accumulated over the different lines of the company, is shipped to the works and stacked into a large pile. The old iron is assorted and cut up to make one length, after which it is packed on boards and then taken into the different smelters, where it is made into bars.

In the rolling mills every furnace is in full blast, and these are kept going all day and night. In this department over 35 tons of iron are worked over daily. Fish and angle plates are being turned out in large quantities. Nuts and spikes are in great demand, and they are also being turned out as fast as the machines can do it. Over 14,000 pounds of spikes and nuts are made daily, which are packed into boxes of 100 pounds each, all ready for shipping. The demand for spikes and nuts is so great that it is estimated that there is enough work ahead to last for a year. "Unless new machines are put up," said a roller, "we will never catch up."

The foundry is crowded with work, a great deal of which is the molding of bridge frames. The blacksmith shops present a very different scene to what they did a few months ago. The shops, besides being crowded with work, are also crowded with blacksmiths. Every anvil and steam hammer is being used in making iron bridge frames and other work.

The noise in the boiler-shops makes old-time music. New boilers, tanks and smokestacks are being turned out. The employees of this department have been "doing extra time" to keep up with the press of work.

The large machine-shop, like the rest of the shops, is kept going in full operation. There is plenty of work in this department—so much so that "night times" are often used. The shop has the reputation of turning out the finest and largest locomotives in the world. For some weeks Master Mechanic Stevens has had his attention attracted to the building of two large powerful passenger locomotives. These engines will probably be given a trial trip in a few days, and it is said that when they get in running order they will be the fastest locomotives in the United States. The success of building locomotives by the Southern Pacific Company has encouraged them to keep on. This, of course, will require the services of many more mechanics.

A new cylinder will be put in the ferry-boat Oakland as soon as the vast piece of mechanism, which is now in the machine-shop, is made ready.

A Stockton fire engine sent to this shop for overhauling has been made nearly new.

Every stall is occupied by locomotives receiving repairs.

The making and repairing of passenger and freight cars is keeping hundreds of men busy.—Sacramento Bee.

## The Kimberley Gold Fields.

A correspondent of the Sydney Herald, writing from McPhee creek, on July 21, gives a gloomy view of the Kimberley gold fields. He was sent out by the Herald to make a careful estimate of the diggings, and from his observations and the testimony of experienced miners, he pronounces the diggings a failure. The following are the most interesting points in the letter:

This is the main camp in the center of what are named the "Kimberley Gold Fields." There were about 70 men and 100 horses camped there; Samuel Johnson, one of the men recently speared by the blacks, was also there. I had a personal interview with him, and the information I obtained from him has since been verified by personal observation, and also from conversation with at least 100 miners, many of whom have been on the field for months, others for weeks, and others again for only a few days; but all are unanimous in pronouncing the diggings a gigantic failure. Mr. Johnson has been on the field, which embraces an area of some hundreds of miles, between seven and eight months. He states that he, with four others, came overland from Port Darwin with a thoroughly complete outfit and 30 horses. His party commenced prospecting as soon as they struck the Ord river, and have been hard at it ever since. As they have experienced both the wet and the dry seasons, Mr. Johnson ought to be able to speak with some authority. He stated that he had no hesitation in pronouncing the diggings a failure.

All the gold hitherto got has been obtained by gully raking, which is very "patchy." Sinking is useless, as it is impossible to get down more than a couple of feet. No quartz reefs have been found as yet, and the gold ap-

pears to come from "mullocky" leaders. I do not assert that there is no gold in the district, for something like 2000 ounces must have been unearthed. But it must be remembered that the parties who have got the bulk of this came here well equipped with horses and provisions, and prepared to prospect the country in all directions. They have completely worked out all the good gullies, and although many of those who arrived in the various steamers at the Gulf are still working, very little gold is being got—not sufficient to give men rations.

Several men have been killed by blacks, and fully 20 men have been missing, for weeks past. They went out prospecting in different directions, in parties of two and three, with provisions sufficient to last them only a few days. They have never been heard of since, and it is feared that they have either lost themselves and perished in the bush, or have been murdered by the blacks.

## The Coinage.

Report of the Director of the Mint.

James P. Kimball, Director of the Mint, has submitted to the Secretary of the Treasury his annual report for the fiscal year ended June 30, 1886. While the volume of work executed at the mints during the year was greater, he says, than that of the previous year, the total expenditures were less by \$197,089. The coinage of gold during the year amounted to \$34,077,380, against \$24,861,123 in the previous year. The silver coinage amounted to \$30,022,347, against \$28,848,505 in the preceding year. Of the coinage of the year, \$29,838,905 consisted of silver dollars, and the remainder of subsidiary coin. In addition to the gold and silver coinage, minor coins were struck off of the value of \$17,377.65.

The total coinage was 38,844,662 pieces, of the value of \$64,117,105. In addition to the coinage, the value of gold and silver bars manufactured during the year amounted to \$27,268,032.

At the date of the act authorizing the coinage of the standard dollar, February 28, 1878, the London price of the silver dollar was 55 pence, equal to \$1.20 per ounce, at which price the intrinsic value of the silver dollar was .935. At no time since has the price of silver reached 55 pence, the tendency having been steadily downward, with occasional temporary advances. During the past year the decline has been very marked. On July 1, 1885, the price of silver in London was 49½ pence British standard, equal to \$1.07 9-10 per ounce fine, while on June 30, 1886, the price was 44 1-16 pence, equal to 97 9-10 cents per ounce fine. Since the close of the fiscal year there has been a further decline until July 31, 1886, the price of silver reached 42 pence, equivalent to 92 cents per ounce fine, which was the lowest price ever reached. At the latter price the bullion value of the silver dollar is 71 2-10 cents. The price has since advanced until on October 20th it was 45 1-16 pence, equivalent to 93½ cents per ounce.

The value of the gold and silver wasted in the operative department of the mints during the year was \$19,206. The value of gold bullion imported into the United States during the year was \$40,730,458; exported, \$27,565,090. The import of gold coin to the United States was \$16,669,891; exported, \$15,440,991. The imported silver bullion during the year amounted to \$4,151,438; exported, \$10,780,656, of which \$354,848 consisted of trade dollars.

The director estimates the amount of United States coin in the United States on July 1, 1886, to have been: Gold, \$548,320,031; silver, \$308,784,223; total, \$857,104,254. In addition to the coin there was gold and silver bullion in the mints and assay offices belonging to the Government as follows: Gold bullion, \$42,454,430; silver bullion, \$3,468,620, making the estimated stock of coin and bullion available for coinage in the United States \$903,027,304.

MINING COMPANIES.—The following statement shows the condition of various mining companies on the 1st inst.: Alpha Con., cash on hand, \$11,467; Alta, \$6081.04; Benton Con., \$279.19; Belle Isle, \$4095.61; Bodie, \$21,321.84; Best & Belcher, \$8973.65; Bulwer, \$1566.05; Chollar, \$12,092.50; Exchequer, \$1539.35; Gould & Curry, \$37,878.16; Hale & Norcross has an indebtedness to the amount of \$15,531.45, with \$43,092 to be collected from the assessment. Lady Washington, \$529.99; Martin White, \$9247.46; Mexican, \$10,171.76; Mono, \$15,763.36; Navajo, \$23,879.33; North Belle Isle, \$2611.85; Ophir, \$3686.07; Occidental, \$9493.86; Potosi, \$7270.55; Peer, \$1976.28; Standard, \$17,918.13. The following companies have indebtedness: Crocker, \$774; Hale & Norcross, \$15,531, and \$43,092 to be collected from assessments; Peer, \$1976; Peerless, \$16,665; Savage, \$2652.

A CALIFORNIA MANSION.—Mrs. F. E. Waite has contributed under this title an excellent article to *Good Housekeeping*, descriptive of the new house of J. C. Flood, in this city. Several fine illustrations of the interior of the mansion are given. This new building is one of the finest in the United States, and its decorations and furnishing, according to Mrs. Waite's pleasant description, place it second only to the Vanderbilt mansion in New York.

## Passing Events.

Silver has at last got up to be quoted \$1 per ounce, and indications are that it will go still higher. In fact, in this city this price has been refused on account of advancing English quotations.

Crosscutting in the drift run from the tunnel in the Quijota, Arizona, mines was commenced this week. Those interested in that region from which so much was promised will be glad to learn this.

In Alameda county, regarded generally as a cow county, they are now mining not only for chrome, but for magnesia, borax and oil. It is a good illustration of the diversity of products of this State, when, in a county renowned for its fruits, etc., so many mineral substances are found.

It is stated that quicksilver has recently been found in New Mexico. So far California has been the only place in the United States where this metal has been mined. We shall look with interest at the progress of development in New Mexico.

The Comstock mines are producing more bullion just now than for some time past, and we are even promised a dividend from one company, formerly famous for them, but which has for several years not paid.

EIGHT HUNDRED coal miners, employed at the Erie, Marshall, Fox and Louisville mines, Colorado, quit work because of a reduction of their wages from \$1.12½ to \$1 per ton.

## Vanadate of Lead.

In the early part of the year the PRESS mentioned the occurrence of vanadate of lead in Montana and of Roscoelite in this State, and intimated that vanadium minerals were found in Arizona. It now appears that the Arizona supply is developed, and to-day supplies the United States demands, which are very small.

Mr. Chas. R. Fletcher, of Boston, bought the Mammoth and other gold claims in Pinal county, Arizona, 50 miles north from Tucson, in November, 1884, and at once his talented eye discovered that the mineral of his gold quartz was vanadate of lead and zinc, etc., and he at once arranged to get the mineral into the market as soon as his 30-stamp gold mill should be finished. This took place in September, 1885.

Since that time he has shipped several tons of concentrated mineral, carrying about 16 per cent vanadic acid, the concentrates being made up of chloro-vanadate of lead, vanadate of lead and vanadate of lead and zinc. The price realized is 12½ cents per pound f. o. b. Tucson, whence it is taken by a Philadelphia chemical company, and manufactured into vanadate of ammonia.

Since this has come into the American market the price has dropped to one-third its former price, and will no doubt drop to a low figure, in which case the uses may extend. At present vanadic acid is what is valuable, solely as an oxidizing agent in the production of the aniline black dye. Vanadium minerals have long been known in this country. In New Mexico Dr. F. A. Genth found many forms. In Arizona are all varieties of both the red and brown vanadates, in many localities in Pinal, Mohave, Yuma and Maricopa counties; and in the Mammoth gold mine all forms are found, also molybdate of lead, of no value, but beautiful as crystals. In Mexico vanadium minerals are common, and in Montana is a very large and rich supply.

A gold mine like the Mammoth is obliged to concentrate its mineral for the gold. The concentrates of the mine carry about \$140 gold per ton and \$5 silver, consequently the vanadium receipts are profit, which would not be the case were the mineral sulphurets instead of vanadates. The analysis of the red crystals of Mammoth by Genth is: Chlorine, 2.43 per cent; lead, 7.08 per cent; lead oxide, 69.98 per cent; ferric oxide, 0.48 per cent; vanadic acid, 17.15 per cent; arsenic acid, 3.06 per cent; phosphoric acid, 0.29 per cent; total, 100.47 per cent. The minerals found here are chiefly vanadate and deschlorite.

Prof. Silliman, of Yale College, found vanadium minerals in several parts of Arizona in 1880. Prof. Wm. P. Blake found them there in the same, and other parts, in 1881. Mr. Fletcher's discoveries at Mammoth, Arizona, resulted in an examination of the subject by the Colorado Scientific Society, by the Royal Academy of Vienna, and numerous mineralogists in America and Europe, and through his attention they were able to observe the mineralogical occurrence and crystalline form of these beautiful and somewhat valuable minerals.

The metal vanadium was discovered about 20 years ago, (1867), and resembles antimony somewhat. It has no value, although it has somehow got into print as worth the prodigious figure of \$10,000 per pound. The Mammoth Mining Co., Arizona, makes over a ton daily of vanadium-concentrates on their 30-stamp mill, but can with difficulty sell one ton monthly to chemical works. The rest goes to the Pueblo Smelting Works, for the gold and silver; the vanadium being as worthless as the rare metal titanium, or tellurium, to the smelter.

Vanadinite is found in Scotland and in Russia, though to date the Mexico and Montana supplies are the richest. At the Mammoth gold mine, Arizona, the vanadium minerals make up perhaps 2 per cent of the ore, and of this, about 15 per cent is vanadic acid. The development of this supply in Arizona, where it has been looked upon as red lead, and entirely worthless, for years by the first owners, is due to the former owner, Mr. Charles R. Fletcher, the talented chemist, and metallurgist of Boston, Mass., who has kindly furnished us the information. He has examined the subject for two years, and a statement of everything known on this subject will soon appear as a U. S. Government pamphlet.

## Let the Mineral Lands be Preserved for the Miners.

It is evident now that California is, for some years to come, going to receive from outside sources large accessions to her population. The new immigration from the East has for some time past averaged over 700 per week, indicating an influx from that quarter of at least 30,000 for the current year, the probabilities being that the immigration next year will be even larger. As most of these newcomers will be apt to seek homes on the public domain, the foothills of the Sierra Nevada, because of the excellence of the climate and their adaptability to fruit and grape-growing, will no doubt attract many of them into that section of the State. As this region comprises also the principal gold field of California, there is a danger that much land more valuable for mineral than for agricultural purposes will, through the remissness of the miners residing in the neighborhood, be suffered to pass into the possession of these new settlers, instances of this kind, as we are advised, having already occurred. Even more imminent is the danger that such mineral lands will in large tracts be claimed by the several railroad companies to whom land subsidies have been granted by Congress, and that these claims, through lack of protest, will finally be confirmed to such companies. The law has not made it the special duty of any one to look after and resist claims so improperly made, presuming that the miners would be sufficiently interested to oppose them and compel their being judicially passed upon. This the miners have generally, but not always, done; and now that there is likely to arise a greatly increased demand for land for the purpose of tillage in the mineral districts of the State, the miners should be aroused to greater vigilance and see to it that their rights in this portion of the public domain be not encroached upon. Opposition must be made before the claimant perfects his title, since after that it can be of no avail.

What baleful effects may attend a too lax policy in matters of this kind is shown by the immeasurable and irreparable injury inflicted upon the mining interest of both California and New Mexico through the decisions of the courts confirming to the claimants under Mexican grants all the minerals contained therein, notwithstanding these were in terms excepted from such grants, in accordance with the laws, policy and perpetual usages of all Spanish-American countries. This decision, so at variance with law, justice and common sense, was rendered first in the proceedings had to confirm the Fremont Mariposa estate, and, having been established as a precedent, was afterward adhered to in all similar cases coming up for adjudication. As in California so in New Mexico, where these grants are numerous and cover millions of acres, this rule has prevailed, to the great detriment of mining as well as of many other industrial interests.

But it is a strange and suggestive fact that the parties who it might be expected would have benefited largely by this decision of the courts, have, as a general thing, reaped from it only vexation and disaster. The Mariposa grant, confirmed to John C. Fremont, now more than 30 years ago, profited him nothing, nor have any of his successors ever been able to realize anything out of it. On this estate, which covers nearly 70 square miles of mineral territory, millions of dollars have been expended in improvements and other millions in litigation, and yet it is doubtful if it has ever returned a single dollar of legitimate profits. Loaded down with debt, harassed with lawsuits and plunged into bankruptcy, this property has for 20 years or more been the prey of contending factions, the production having meantime been inconsiderable and never more than enough to pay current expenses, both the mills and mines for some years past having been wholly idle.

Over these Spanish grants in New Mexico a similar blight seems to have rested. Though rich in minerals, few of them have made any large or profitable production. The owners, when they have attempted to work the mines themselves, have generally lost money; when they leased them to others they have been in constant turmoil with the occupants. Nothing seems to have gone right with either party. New Mexico, though possessed of mineral resources equal to those of Colorado, adjoining her on the north, yields less than one-sixth the amount of bullion produced by her neighbor.

Seeing how badly most of the mines have turned out, over which this judicial ruling has cast its Upas shade, it may well be inquired if there is not something that savors of retribution in results so generally disappointing.

## A Century of Progress.

An occasion of great interest in the scientific world has been the recent celebration of the hundredth birthday of Chevreul, the great French chemist.

Chevreul was born at Angers, France, on August 31, 1786, his father being a physician and chemist. It is noticeable that the father reached the age of 91, and the mother died aged 93. At the age of 17, Chevreul left his native town and turned toward Paris, which was at that time peculiarly fortunate in possessing as teachers and professors eminent men in every branch of science.

Chevreul entered under Fourcroy and Vauquelin, two eminent teachers of chemistry at the College of France, and soon so distinguished himself as to be allowed to take charge of the laboratory when 20 years of age. At 30, he was appointed special professor of chemistry in charge of the dyeing department at the Gobelins, where the world-famous tapestry is manufactured. One of his earliest discoveries was that of margarine, oleine, and stearine in oils and fats. The last of these furnishes stearic acid, and thus an important interest like that in stearic candles, which have now completely replaced the old tallow dips, was founded.

In 1830 Chevreul was appointed Director of the Museum of Natural History, and his life is now passed between this institution, the Gobelins, and the Institute of France. He never fails to attend the Monday meetings of the Academy of Sciences.

The number of his papers, memoirs, etc., is very great, among them being one written in 1832, on the divining-rod, and another in 1853, in which he dissipated the mystery surrounding table-turning and similar manifestations. Chevreul is exceedingly temperate, drinking nothing but water or beer, and never using tobacco in any form. His longevity is not ascribed to this, however, but is due to a robust constitution and a life wisely ordered, regular and laborious.

It is instructive to review the wonderful events which have occurred during the lifetime of this great centenarian. Until he became of age flint and steel, with tinder-box and sulphur-tipped splints of wood, were the common means of obtaining fire for domestic and other purposes.

Friction matches are now found everywhere, and coal-gas is our common illuminant. During the lifetime of Chevreul, Faraday, the great chemist, electrician and philosopher, has lived, worked and died. Darwin has given his famous theory of evolution to the world. Railroads traverse every continent and steamers connect remote parts of the world. The electric telegraph puts us into immediate communication with the most distant countries, and the telephone is daily attaining greater importance.

During his lifetime the great discoveries of gold in California and Australia have been made, and silver mines have been found in all parts of the world. The electric light blazes forth in all the cities of the world, and the discovery of nitro-glycerine has revolutionized the exploitation of mines. In brief, the present century has witnessed a series of revolutions in every branch of science and has been the occasion of greater progress in the arts and manufactures than during any equal period in the world's history.

**THE SCHEARER AND RADLER MINE.**—About one year ago a great deal was being said concerning the Shearer and Radler mine in Shasta county, which had at that time attained wide notoriety by reason of the rich deposits of the telluride of gold found in it. Latterly, we fail to hear much about that property, though it is hoped it will come out all right, notwithstanding its location on the old Redding ranch, one of those misfortunate Mexican grants of which we speak in the article in another column on the subject of preservation of mineral lands to the miners. There is encouragement in this hope because the big wages made along the gulches here in the early days argues that this district may have been spared those malign influences so born of perverted justice and everywhere so ominous of evil.

## Assaying Amalgam.

In George Attwood's "Practical Blowpipe Assaying" is a chapter on assay of mercury, in which the author gives some directions for testing amalgams of gold, silver, copper, lead, zinc, tin, etc. Native and artificial amalgams, as well as dentists' products, are often so hard and compact, as well as mixed with lead, bismuth, zinc, copper, etc., that a correct determination cannot be arrived at by direct distillation owing to the swelling, spitting and spurring that take place soon after the application of heat. An approximate test should be made in charcoal, or in a small crucible or glass tube, and if the spurring is found to be so violent that the amalgam cannot be distilled without loss, it should be crushed up in the agate mortar and then placed in the retort for distillation. In many cases the latter plan is most difficult, and in some impossible, without losing a large portion of the sample. In such a case the operator should weigh out one equal part of pure mercury, mix it with the assay sample, and then crush it in the agate mortar. The amalgam will then be found to be in a semi-fluid condition, in which state it must be removed to the iron retort, and the mercury can be evaporated and collected without danger of loss in spitting, and the weight of the mercury added, deducted from the total found.

In assaying amalgams make two assays; 1st, distill the amalgam, then condense and collect the mercury, and weigh; 2d, subject the amalgam to the blowpipe flame, either in an open cup or dish, and take the loss of weight to be mercury. The heat should never be sufficient to fuse the retorted metal, else a loss will arise from the volatilization of lead, zinc, silver, etc., all of which are frequently found to be combined with mercury.

The last method will be found to be very accurate when the amalgams consist of nearly pure silver or gold combined with the mercury, but if other metals exist with them the results are very uncertain. It serves, however, not only as an approximate assay, but as a check on the distillation assay. The retorts used for the determination of the amount of mercury contained in amalgams are best made of cast steel, which is afterward turned on the lathe to the required form. The retort is made one inch in length, which includes the cup and cap; the neck about two inches in length, having a gentle taper toward the end, which is made to fit into a good cork which has been previously placed in the glass endwise.

Ten to 30 grains of the amalgam to be examined is weighed, wrapped up in a small piece of tissue paper and (the weight of ash contained in a similar piece of the same paper must always be determined in a quantitative assay) placed in the receiving cup. The cap is now placed firmly on. The joint being perfectly airtight, no luting is necessary.

The condenser is attached and the retort placed in the charcoal furnace, which has now to be held firmly by the holder. The furnace is now brought near the blowpipe lamp and the end of the condenser kept immersed in water contained in a small porcelain crucible.

The heat is applied very quietly at first, but shortly a strong reducing flame may be applied through the hole in the lower part of the furnace. Flames will soon be seen coming out of the top hole of the furnace, and the retort will be found to be red hot. Keep it so for about two minutes, then cease blowing and allow the retort to cool.

The accompanying engraving (which is about two-fifths of the size) is a sectional view of the blowpipe stand and lamp, with flame playing on the amalgam retort, which has been placed in the little charcoal furnace; it also shows the position of the condenser and receiver of the mercurial vapor. The whole operation does not take ten minutes, and although the retort may appear large, the operator will find no difficulty even in obtaining a white heat if necessary, and in a few minutes the assay is completed. The mercury is collected and weighed. To do this, pour off the water, dry the mercury with blotting paper, and remove to a small weighing cup and ascertain its weight on the balance. The mercury so obtained can be considered pure. Most accurate results will be obtained by following the above instructions.

The Idahoan, at Wood River, I. T., has paid \$30,000 in dividends during the current year.

## An "Automatic" Dining Table.

A very novel and useful invention was exhibited in operation at the restaurant in the recent Mechanics' Institute Fair in this city, in the form of a dining table so constructed that the services of waiters may be dispensed with. As may be seen by the accompanying engraving, the "table" is a long one with a central passage running its extreme length and communicating with the kitchen. Side openings also communicate with the small side tables for the different guests. The central passage has a tray-bearing carriage, mounted on tracks and adapted to move back and forth within the passage. The carriage is given movement by

THE AUTOMATIC DINING TABLE.

means of a wheel in the kitchen, and suitable connecting mechanism of simple character. The trays upon which the dishes containing food are placed hang by arms to the carriage, so that when turned outwardly they lie wholly over the guest spaces (through the side openings of the passage), and when turned inwardly they lie within the central passage.

The operation of the table is as follows: The guest, having been seated, determines, from the bill of fare placed before him, his order, and

time lost in running back and forth to the kitchen in large rooms, often renders the hungry guest very impatient and does not put him in the sort of temper desirable for comfort and good digestion.

The table is not only adapted for large restaurants, but is also suited to railroad hotels, where, owing to the uncertain number of guests, they are obliged to maintain the maximum force of waiters. The operation of the device is noiseless, and the nervous man is relieved from the disagreeable shouting of waiters giving orders. A gold medal was awarded this invention by the Mechanics' Institute Industrial Exhibition. A company called the Automatic Dining Table Company has been organized,

with offices at 162 Ninth street, to manufacture and introduce this table. The appliance can be made to suit requirements of a cheap restaurant, or a Palace hotel, being made either plain or ornamental.

## Mohave Mines, Arizona.

About three years ago, Walter Scott, a well-known prospector and miner, satisfied himself that the Chimbueve range of mountains in Mo-

APPARATUS FOR ASSAYING AMALGAM.

indicates it upon the bill by writing or suitable mark. He then places the bill of fare upon the tray which lies immediately in front of him, and, by means of a push button in an electric system, calls the attention of the people in the kitchen. The attendant there knows by the signal the location of the guest, and, by operating the wheel in the kitchen, draws the tray, with the bill of fare, on to the carriage in the central passage, and thence to the kitchen.

Here the order is filled and, replaced on the tray, the mechanism is operated, and, on the tray reaching the position indicated, is automatically passed out of the side passage on to the small table in front of the guest. The whole thing is done rapidly and without confusion. The mechanism is such that no mistake can be made, and the order is sure to come to the one who sent it.

By this invention those who dine at restaurants will have their meals served well and promptly, and the services of waiters may be dispensed with. Too often it is the case that the people who wish to eat are the "waiters" instead of the attendants, each one of the latter having too many persons to look after. The

have county, Arizona, was a first-class place to hunt for rich ore. By long and patient work in that region he succeeded in finding ledges of both gold and silver ore, the ledges being about 28 inches wide and the ore rich. A well-known California-street merchant of this city furnished Mr. Scott the means for prospecting the ground. We have been shown specimens, which are very rich. The gold ore is exceptionally rich, not only showing plenty of free gold, but gold in heavy pieces. A shipment of silver ore recently made to this city assayed \$190 per ton. A prominent mining man who represents Scotch capital has offered to bond the mine for a large amount.

This discovery is supposed to be the richest ever made in Mohave county. It is the intention of the owners to erect a mill shortly and commence working the ore. The ledges are near the Needles, and some 14 miles from the railroad. The settlement of the Indian question in Arizona is a good thing for the mining interests of that region, since, heretofore, capitalists have been reluctant to invest there. Now, however, there is no excuse, and this is but one of the examples to show that people

will develop mines in Arizona and be willing to invest there when they can be sure of safety to life and property.

## Personals.

D. Ernest Melliss, civil and mechanical engineer, left San Francisco for the East last week.

F. H. Jennsen, chemist and manufacturer of high explosives, is at the powder works at Point Penole.

Mr. Hans C. Behr, mechanical engineer, has lately removed his offices from 414 California street to 609 Sacramento street.

Prof. Thomas Price, the chemist and metallurgist, has been elected Vice-President of the California Academy of Sciences.

J. C. Henkenius, for some years past in the U. S. Surveyor-General's office in this city, has taken up his residence in Oakland.

Sanford Robinson, C. E., formerly of this city, is now General Manager of the Champerico & Northern R. R. in Guatemala.

A. Van Blarcom, mining engineer, formerly of Eureka, Nev., and more recently engaged in mining in Mexico, is now in Montana.

Irving M. Scott, of the Union Iron Works, who has been East some months, will not return to this State before the close of the year.

David McKay has retired from the superintendency of the Empire mine, Grass Valley, and V. M. Clement has been appointed in his place.

Prof. Wm. P. Blake, of New Haven, who is well known on this coast, is at present in Arizona, where he is planning and carrying out an extensive water enterprise.

Augustus J. Bowie, Jr., author of "Hydraulic Mining in California," and well known as a mining expert, is at present in Mexico, examining some mines. He will return in about a month.

The recent appointment of Capt. A. H. Payson as U. S. Engineer in charge of the Lighthouse Department of this coast, is simply some official routine, as he has held the position for several years.

Mr. Gardner F. Williams, the well-known mining engineer of this State, who visited the South African gold and diamond fields last year in the interests of English capitalists, left this city this week for England, on mining business, and will be absent several months.

Geo. J. Specht, C. E., the Vice-President of the Technical Society of the Pacific Coast, who has been engaged in engineering work for the Spring Valley Company in San Mateo and Santa Cruz counties for some months, has returned to the city to finish up the office work.

Mr. P. J. Flynn, C. E., author of "Hydraulic Tables based on Kutter's Formula," and "Flow of Water in Open Channels" in Van Nostrand's Science Series, who for several years has been employed on Oakland harbor work, until last summer, when he went East, has returned to California.

An Associated Press dispatch to the effect that Col. George F. Mendell, of the U. S. Engineers, in charge of the Government works around San Francisco harbor, has been relieved, is misleading. It was stated that he would be succeeded by Major Wm. H. H. Benyard, who has been on duty at Chicago. Major Benyard will not be stationed in San Francisco, but will go to Southern California, probably to San Diego or Los Angeles, and will look out for Government works there. As Col. C. S. Stewart, for many years stationed here with Col. Mendell, has been placed on the retired list, at his own request, Col. Mendell is the only engineer officer in this city engaged on river, harbor and fortification work. He will probably remain for some time yet, and, it is hoped, will be here permanently.

VERY few people have any idea of the importance of American Flat as an ore producer. There are several good working mines in that district, the principal one being the old Santiago Mill and Mining Company's mine, now owned by Mr. Quinn, Ed. Hamilton and others, they refusing \$45,000 cash a short time ago. There are four men on each shift working on the mine. Yesterday six large ore wagons, loaded with the precious rock, left the mine bound for the mills in Silver City. The ore averaged about \$40 per ton. The district is pretty well staked off and claimed, but there is yet a chance for other prospectors to secure a foothold in the neighborhood and try their luck as these men have done.—*Territorial Ent.*

## MECHANICAL PROGRESS.

## What Steam Has Done.

## Mechanical Progress is Moral Progress.

The books and papers of the day are full of reports of the great revelations in mechanics and industry which have been brought about, during the last century, by the introduction of steam. But steam has achieved victories in the moral as well as in the physical world. In proof of this we note a few facts, which we compile from a cotemporary:

In ancient times the invading conqueror generally carried away to his own country a large portion of the population of the land which he had overcome and made slaves. Why? Because he wanted to remove from his own people a part of the burden of toil. History is full of accounts of such performances. In fact, the process endured to our time, for the capture of negroes in Africa, and their deportation to this country to be sold as slaves, was simply another form of the old business. The slave trade merely supplied a demand for labor from people who wished to reduce their own labors. Now observe. The invention and general introduction of the steam engine ended this kind of thing forever, for it gave to man a servant far more tractable, more economical, more energetic, more tireless, than any number of human servants could possibly be. The effect upon the laborer, of this change, was to uplift him and give him dignity. Labor is no longer joined with slavery.

This is the century of the steam engine. The same century has witnessed the emancipation of the slaves in this country and of the serfs in Russia. It will not close before the slaves will be freed in Cuba and Brazil. Then there will not be an involuntary bondsman in any civilized land on earth. That majestic fact, of vast importance to the toiling man everywhere, is due solely to the introduction of steam and the general advancement of mechanical invention due to the introduction of steam as a motive power. In the meantime, the general status of the laborer has been so much advanced that he is now for the first time in the history of the world counted as a great political and social power. The laboring man to-day is on top. That is a practical, even if it be a startling, fact.

Note this, also, as another result of the introduction of steam machinery: The laborer in civilized countries now earns more money than he ever before earned, and the things which he requires for his comfort and his pleasure cost less than at any former period since the creation. If workmen would only read history they would find much to induce them to greater contentment. There was not in the British islands, 300 years ago, a dwelling-house that would compare in comfort with any one of the tens of thousands of excellent homes owned in this country to-day by men who earn \$10 or \$12 a week. The poor man has them because machines have been invented to do the work which men used to do, and because these machines have capacity for production far beyond the unaided capacity of man.

**A NEW USE FOR THE DRAW-SHAVE.**—A correspondent of the *Blacksmith and Wheelwright* recently visited a country blacksmith's shop, where he witnessed an entirely new process for "pointing" a piece of iron. The blacksmith, after his "heat" had reached its proper temperature in the forge, left it for an instant, while Vulcan laid an old saw and a draw-shave on a bench near the anvil; he then dipped a piece of woolen cloth in his water trough and fixed the cloth on the back of the saw with two bits of hoop that nipped it there, so that the water ran down over the blade. He then swung his "heat" out of the fire, placed it in the vise and clamped it securely in position, as he was working without a helper. He next took up the saw and with it cut about two inches off the molten mass with a few rapid strokes, then snatched up the draw-shave and drew off white hot shavings to taper the end of the piece, only once pausing to dip the draw-shave in water, and turn the under side of the iron uppermost, and the draw-shave was flung into the water to cool. Now followed the rasp; this was nailed on to a staff or stake over three feet long, and the power thus gained to make the teeth of the rasp bite into the hot iron was manifest from the incessant showers of iron which flew off at every stroke. He remarked he was working both sides of his anvil, as his mate was away, meaning he had to do his work single-handed. The use of the saw is common, but we have never seen an ordinary draw-shave used for paring down hot iron.

**PRODUCTION OF ELECTRICITY.**—Electricity is making quite as rapid strides toward utilization as a motive power as steam was doing one hundred years ago. The great thing in electricity now being sought for is some means for developing it from burning coal, without the intervention of a steam engine or any other motor. Many experiments have been made and not a few devices have been contrived—one of these, by an English inventor, in which the electro motive force of a cell is given as about 0.7 volt. This is, of course, much less than the theoretical electro motive power of a hydrogen and oxygen couple, and the remaining energy evolved by the combination appears to be developed in the form of heat at the surface of the oxygen plate, and serves to keep up the temperature of

the apparatus. In the action of the battery the hydrogen, in passing through the inner tube, is, so to speak, filtered off from any gases with which it may be mixed, and the residual combustible gases, if any, when drawn off by the escape jet, can be utilized as fuel for the furnace. This is considered a very valuable feature, as it enables the battery to be worked with strong producer gas, consisting mainly of hydrogen and carbonic oxide, and to be arranged in a compact way, the spare heat left from heating the cells being available for working the producer. It is claimed that a ton of coke used in heating the battery, including the hydrogen producer, gives at least three times the electric energy produced by the same quantity of coke used in working a steam engine and dynamo.

**THIN FIRES THE BEST.**—Mr. John A. Coleman, of Providence, R. I., in an address before the American Railway Master Mechanics' Association, spoke about combustion fire boxes and steam boilers, and among other excellent "points" made were the following: "Thin fires accomplish this. A given amount of coal generates a given amount of gas, and this gas requires a given amount of air or oxygen. This air must be supplied through the grate bars and then pass through the interstices of the mass of heated coal. It requires about 10 cubic feet of air to consume one cubic foot of gas. In stationary boilers, we find that if we use 'pea' and 'dust' coal, an extremely thin layer must be used, or the 10 feet of air per foot of gas cannot pass through it; if 'chestnut' coal be used, the thickness may be increased somewhat; 'stove size' allows a thickness of six inches, and 'lump' much thicker, if any wise man could be found who would use that coarse, uneconomical size. Of course, I am speaking of anthracite coal. Opinions differ about 'soft coal,' but the same general principle applies as regards an unobstructed passage of air through the hot bed of coal."

**THE ADVANTAGES OF CYPRESS FOR LUMBER.**—The cypress is soft, more closely resembling the better qualities of the white pine. It is easily worked and commands a high price in the market, merely because of its value and superiority. It grows in clusters on low, swampy grounds subject to overflows. On account of its aquatic life it seems to endure exposure to the weather. Cypress roofs and sidewalks in New Orleans are a century old. Cypress is usually cut in low water, and floated out in high water. The Northern lumber companies are rapidly erecting mills and putting them in order in certain sections of Louisiana and Mississippi. From present appearances the lumber interests in these States will soon exceed the cotton interest. Suffice to say there is an enormous supply of these varieties of lumber, and their manufacture and marketing will have some effect on the price of Western lumber.

**A DRY COMPOUND FOR EXTINGUISHING FIRES.**—An eminent German physicist recommends for the extinguishment of fires in closed places where the use of water or other liquids would be likely to do great damage, a dry compound, which, by its burning, absorbs the oxygen and quickly renders combustion impossible. The compound is composed of powdered nitrate of potash (saltpeter), 59 parts; powdered sulphur, 36 parts; powdered charcoal, 4 parts; colcothar (brown-red oxide of iron), 1 part. This preparation is one that can be cheaply made. It is recommended that it shall be, when thoroughly dried and mixed, put up in tight pasteboard boxes, holding about five pounds each, with a quick fuse in the side of the box—protruding six inches, with four inches inside—to facilitate and insure lighting it.

**THE ERA OF FUEL GASES,** both natural and artificial, has become an established fact. The total displacement of coal at Pittsburgh for the year is calculated at 2,550,000 tons, and there are 491 miles of iron-pipe gas mains entering Pittsburgh, as built by the four companies which control that supply. The new forms of labor created by these works, and the increase of active work at the iron mills and gas works, give employment to more men than the 3500 assumed to have been displaced in coal mining and coal handling in transportation, as also in the firing and cleaning of coal furnaces.

**LOOK FOR THE CAUSE.**—If a belt is disposed to run off, says a cotemporary, we should never try to keep it on with a stick, but remember there is always a cause, and look at once for a remedy. Four causes alone operate to throw off a belt—the belt being crooked, poor lacing, the belt being too tight for the work, or the shafts not parallel, throwing the pulley out of line. Usually the latter is the cause. Shafts are liable to get out of line, and machines are liable to get moved from their settings.

**IMPROVEMENTS at the Lick Paper Mills,** Santa Clara Co., have been made from time to time, until now there is an extensive manufactory surrounded by numerous cottages and dwellings which accommodate a large number of workmen and their families.

**ANCIENT ALLOYS.**—M. Richie, in his researches on alloys, finds that tom-toms and cymbals are made of bronze that can be worked cold the same as iron or aluminium bronze. The best tone is composed of 78 parts of copper and 22 parts of tin.

## SCIENTIFIC PROGRESS.

## How Electricity is Generated in the Atmosphere.

The observations of meteorologists show that the vapor which ascends in an invisible state from the ground carries with it, in calm and fine weather, into the higher regions of the air a very considerable supply of positive electricity. Each minute vapor-particle that goes up bears its own portion of the load. When, however, the invisible vapor has thus mounted into very high regions of the air, it loses its invisibility, and is condensed into visible mist. Numerous particles of the aqueous substance are drawn close together, and grouped into the form of little vesicles or globules. Each one of these is then a reservoir or receptacle of electric forces, and as more and more vesicles are condensed more and more electricity is collected in the gathering mist; but each of the water globules is still enveloped by a space of clear air. In a drifting cloud the specks can be discerned floating along with transparent intervals between. The clear air which lies around the globules of vapor then acts as an insulating investment; it imprisons its own part of the required electrical force in each separate globule. The cloud is thus not charged as a whole, like a continuous mass of metal, with its electricity spread upon its outer surface only; but it is interpenetrated everywhere with the force. It is composed of a myriad of electrified specks, each having its own particular share of the electric force, and each acting as a center of electrical energy on its own account. The electricity which at any one instant resides in the outer surface of a cloud, is, therefore, but a comparatively small portion of that which is present in the entire vaporous mass.

That such is the way in which electricity is stored in the clouds has been proved by direct observation. When a gold-leaf electrometer is placed in the mist of a cloud driven along by the wind, it is seen that the strips of gold leaf continually diverge and collapse as the mass of the cloud passes along. There is an electrical charge acting in all parts, but the charge varies in intensity from place to place accordingly as there is a greater or less condensation of the particles of vapor in each particular spot. But the influence externally exerted by the cloud is nevertheless capable of being raised to a very intense degree, because it is, so to speak, the sum total or outcome of the force contained in the innumerable internal centers of energy.

It is no uncommon thing for the electrical force emanating from a cloud to make itself felt in attractions and repulsions many miles away. Clouds resting upon the remote horizon thus frequently produce perceptible effects at distances from which the clouds themselves cannot be seen. An electrical cloud hanging a mile above the ground acts inductively upon that ground with considerable power. When in summer-time the temperature of the earth's surface is very high, the ground moist, the air calm and the sky clear, very copious supplies of vapor are steamed up from the ground under the hot sunshine. Clouds, however, begin at length to gather in elevated regions of the air out of the abundance of the supply. The free electricity which has been carried up with the vapor is at first pretty evenly spread through the clouds; but after a little time, as the electrical charge becomes more and more intense, a powerful repulsive force is in the end established between the spherules of the mist, and a very high degree of tension is at last produced at the outer surface of the cloud, where it is enveloped by insulating air, until in the end the expansive energy there becomes strong enough to occasion an outward burst from the cloud. The escape of the redundant charge then appears to an observer's eye as a flash of lightning issuing from the cloud. Such, in its simplest form, is the way in which lightning is kindled in the storm-cloud.—*Science for All.*

**THE INDUCTION SYSTEM OF TELEGRAPHING.**—A paragraph in an electrical journal states that "a contract has recently been signed between the Lehigh Valley Railroad and the Phelps Induction Telegraph Company for the application of the Phelps system of railway telegraph to the entire system of road operated by them. The work of equipment has already begun, and the first section of about 100 miles from Perth Junction to Manch Chunk will be in operation in a few weeks. The wires will be worked duplex, being used as ordinary Morse wires for local telegraph business and for train service simultaneously." The announcement, says the *Railroad Gazette*, is in some of its details somewhat premature, probably, but the experiments are going on, and indicate the increasing interest in this question. So far the reports of the practical working of the induction system of telegraphing have been uniformly favorable to it.

**TIME OF THE FUTURE.**—The change in the mode of noting time from the old method under which the clocks varied for every 10 miles of longitude, to that of the present "standard time," recently introduced and which has already proved a great convenience, has set many to thinking of the possibility, in the near future, of having but one time for the whole world. That will be the Greenwich civil day, commencing 12 hours earlier than the astronomical day, whose beginning is at the Green-

wich noon, and the hours will be numbered up to 24 instead of in two series of 12 each. Midnight and noon will then cease to be inseparably associated with 12 o'clock, and will occur at hours varying with the distance in longitude from the Greenwich meridian. The advantage urged for making the universal day coincide with the Greenwich civil day is that the change of date at the commencement of a new day falls in the hours of the night throughout Europe, Africa and Asia, and that it does not occur in the ordinary office hours (10 A. M. to 4 P. M.) in any important country except New Zealand. In the United States and Canada the change of date would occur after 4 in the evening, and in Australia before 10 in the morning. Only in the parts of the world that are almost entirely water would it occur about the middle of the day, and this arrangement would thus reduce the inconvenience to a minimum.

## Carnivorous Plants.

It has long been known that certain plants catch and kill insects, but only very recently has it been suspected that they devour and digest their prey. The matter has attracted a great deal of attention of late, both in this country and in Europe, and many careful observers are fully satisfied that these plants are really carnivorous. Others, among whom are some eminent foreign botanists, hold that the captured insects are devoured by bacteria, which may be detected by the microscope in the putrefying animal matter. A piece of meat placed on a leaf of *Drosera* disappears in the same way; but, according to these authorities, it is consumed by the bacteria as it decomposes, and is not absorbed by the plant.

The weight of evidence, however, appears to be on the other side. The more closely these plants are studied the more clearly is their carnivorous character indicated. Some few years ago a series of very careful experiments were made by Dr. Balfour, of the Edinburgh Botanical Society, on *Dionaea Muscipula* and allied plants. These experiments fully confirmed the suspicions entertained by Ellis, Curtis, Hooker and Darwin, that the *Dionaea* is a carnivorous, and, it may be added, a most brutal plant.

Dr. Balfour classified the facts he had observed in regard to it under the heads of irritability, contraction, secretion, digestion and absorption. The irritability, it seems, is resident in six delicate hairs, so placed on the surface of the leaf that no insect can avoid touching them in crawling over. Dr. Balfour touched with a needle every other part of the leaf, and no response followed; but no sooner was the point applied to one of those hairs than a contraction of the leaf ensued. Chloroform dropped on a hair caused the leaf to close like a winking eye, but water had no such effect. It was only when the object seized was capable of affording nutrition that the contraction continued for any considerable length of time. A piece of wood was soon released, and so was a dried fly; but when a live fly or caterpillar or spider was inclosed the contraction lasted on an average for about three weeks. The leaf at the same time gave out a viscous acid secretion. This appeared to be only the case when an insect was captured, and it was always present on such occasions; but whereas with a fat spider it was abundant, with a shriveled fly there was very little. In proof that nourishment is obtained from insects so inclosed, Dr. Balfour pointed significantly to the facts that young plants of *Dionaea* under bell-glasses had been found not to thrive so well as those left free, and that while a piece of beef wrapped in another leaf became putrid, a piece inclosed by the *Dionaea* remained perfectly inodorous, but soon lost its red color, and was gradually disintegrated more and more till it was reduced to pulp. This statement showed the greediness and ferocity of the plant.

**CHEAP SUBSTITUTE FOR A SINGLE MICROSCOPE.**—The object of a lens in a microscope is to enable us to see a minute object distinctly at a less distance than the natural standard of vision, as by so doing we view it under a larger angle; but, in point of fact, we can, to a certain extent, accomplish the same object without any lens at all. Take a card and blacken one side of it, then pierce it with a fine sewing needle and look through the hole at any small object, strongly illuminated, and held about an inch from it; the object will appear considerably magnified. In this case the use of the perforated card enables the object to be brought about 10 times nearer the eye than the ordinary distance of distinct vision, and hence it appears about 10 times larger. In this experiment the effect is equivalent to reducing the pupil to the size of the needle hole, so that the amount of light entering the eye is correspondingly reduced; hence the object must be strongly illuminated to render it visible.

**THE CHARLESTON EARTHQUAKE FELT AT LOWELL, MASS.**—There is a self-recording instrument kept at the offices of one of the Lowell factories which records any rise or fall of water on the surface of the millpond connected with the factory. On the night of August 31st, a few moments after the occurrence of the Charleston earthquake, there was a perceptible agitation of the water of the pond, which was distinctly seen upon the chart the next morning. That agitation must have been caused by the earth vibrations set up by the great earthquake at Charleston.

## ENGINEERING NOTES.

## Electrical Navigation.

The practical advances of electrical science are indicated from time to time by some new and important departure, which serves to mark the progress made up to a certain point. At one time it is the means of producing electricity; at another, some new method of converting it to useful work. It is in this respect that we would now briefly refer to the progress which has been made in electric navigation.

The electric boat, *Volta*, which recently made a very successful trip across the British channel, seems to have awakened a new enterprise in electric navigation. The *Volta* is by no means the first successful effort that has been made in that direction; but the interest attached to it arises from certain improvements in previous practice which promise an important step in advance in electric engineering. This new departure, from a scientific point of view, is the duplex electrical motor of Mr. A. Reckenzaun, with which the *Volta* is fitted. The vessels which have been heretofore propelled by electricity may be enumerated as follows: The *Electricity* was the first boat ever propelled by the agent whose name she bears. She made her trial trip in 1833. Her screw was driven by 40 cells and a Siemens dynamo. She was 25 feet long by 5 beam—built of iron. In the following year a wood-built screw launch, the *Australia*, of about the same dimensions, was constructed and fitted with the improved electric motor of Mr. A. Reckenzaun. Later on a screw launch, 22 feet long by 4 feet 6 inches beam, belonging to the *Vernon* torpedo ship, was fitted with electrical machinery by Mr. Reckenzaun. The example set by the Government in the case of the *Vernon* was followed by the Duke of Bedford, who had a launch 24 feet by 5 feet beam, which was attached to his yacht, *Northumbria*, fitted with a Reckenzaun motor. The latest example of an electric boat prior to the *Volta* is afforded by a steel launch built by Messrs. Yarrow & Co. during the present year for the torpedo service of the Italian navy. This boat is 36 feet long by 6 feet 4 inches beam, and is propelled by a screw driven by a duplex Reckenzaun motor. She made on the measured mile 8.43 miles per hour, and is now in regular service at Spezzia. In each case the electric current is stored in a battery composed of the Electric Power and Storage Company's cells. We here have the various stages through which electric propulsion in vessels has passed as regards the Reckenzaun motor and accessories, and which stages have thus led up to the *Volta*.

She is a six-ton boat, built without a deck. She measures 37 feet long by 6 feet 10 inches beam, and is fitted with a battery of 61 cells made by the Electric Power and Storage Company, and a duplex Reckenzaun electric motor; that is, two motors carried on one driving shaft. By means of this motor the speed can be varied without affecting the accumulators, three speeds being obtained from it, namely, slow, medium and fast. Another important feature is that all these speeds are produced, and the vessel started and stopped, by means of one switch only, having one handle, thus reducing the control of the speed of the boat to the simplest terms. There is a separate switch for reversing the motion of the motors from ahead to stern, and *vice versa*. The motors weigh 730 pounds, and develop a maximum of 16-horse power on the brake. The propelling machinery makes about 600 revolutions per minute at slow speed, and about 1000 revolutions per minute at full speed. The storage cells weigh about two tons, and are arranged along the keel of the vessel beneath a wood decking.

As the *Volta* approached Calais harbor, she became an object of interest and curiosity to those who happened to be on the pier at the time. And well she might, seeing that she was moving steadily along, an open boat, without funnel, mast, or oars, or, in fact, any apparent means of propulsion. On the return journey, the current remained constant at 28 amperes up to 5 p. m., but at 6 p. m. it was found to have dropped to 25, another ampere being lost before Dover was reached. A fine margin of power, however, still remained, and the last half-mile was run at high speed, the motors and screw making 1000 revolutions per minute, the boat entering the harbor in style. Thus was successfully accomplished without a solitary hitch the first voyage across the English channel and back by an electrically propelled boat. No more successful demonstration of the applicability of electricity to the present purpose could have been made, and the event will doubtless give an impetus to practical electricity in this direction. For night work in torpedo operations, it appears admirably fitted, while those owning steam launches will find an excellent substitute for the noisy, sickly-smelling steam engine, and the begriming, carbon-showering coal furnaces.

THE CANADIAN PACIFIC.—One of the promises made by Mr. Gladstone was that the Canadian Pacific Railway was soon to pay the Government \$20,000,000. It is to do this by a loan from Baring Brothers, the proposals for which have just been published. This mortgaging of the future may help the ministry out of one of its most serious difficulties. It is one of those moves in finance for which Mr. Gladstone has always been famous.

## USEFUL INFORMATION.

## Accidents From Machinery.

There is one point, at least, in which the French are in advance of both England and the United States in shop management—that is, in the measures taken for the prevention of accidents from machinery in motion. In France, for years past, young and inexperienced persons have, by legislative enactment, been forbidden to assist in repairing or in adjusting the bands and straps of running machinery. In addition to this, the French have devised and put into practice numerous scientific and some simple, but very efficacious, means of guarding against danger even to those of riper years, who are intrusted with the management of such machinery. Why have we not copied or even excelled the French in these particular directions? The fact is that neither in factory regulations nor legislative enactments has there been any steps taken for preventing the employment of young apprentices or young persons in general from attending to belting, gearing or the cleaning of machinery in motion. Great indifference also exists in regard to the means employed for guarding employes and others against danger while moving about in the presence of machinery. The consequence is that year after year much maiming and loss of life is reported from such causes, in the case of very young persons who have been employed in such dangerous work, which should never be trusted to any but careful and experienced adults.

Apropos to the above we quote from a mechanical cotemporary as follows: A mill filled with machinery driven at its highest rate of speed is not the safest place in the world. Certain belts and portions of the machinery have to be left exposed, but the most dangerous parts are generally boxed up. In spite of this, hardly a week passes that some operative does not lose a portion of his hand or arm. It is said that in a majority of instances these casualties result directly from carelessness. At times defective machinery injures somebody, but more frequently machinery which is in the best condition, though always dangerous, does the damage. One great trouble, manufacturers assert, is that the help, in spite of the warnings posted, persist in cleaning machinery while it is in motion. The work can be more easily accomplished in this way, and commands and threats have no effect. The help complain that they are not allowed sufficient time for cleaning, but it is thought that that makes little difference.

PRESERVATION OF EXPOSED ROPES.—The preservation of exposed ropes is a matter of great importance when scaffolding remains erected for any considerable time, especially in localities where the atmosphere is destructive of hemp fiber. It has been suggested that in such cases the ropes be dipped, when dry, into a bath containing 20 grains of sulphate of copper per litre of water, and kept in soak in this solution for four days, afterward being dried. The ropes will thus have absorbed a certain quantity of sulphate of copper, which will preserve them alike from rot and from the attacks of animal parasites. The copper salt may be fixed in the fiber by a coating of tar or by soapy water. In tarring the rope, it is said to be better to pass it through a bath of boiled tar, hot, drawing it through a thimble to press back the excess of tar, and suspending it afterward on a staging to dry and harden. According to another process, the rope is soaked in a solution of 100 grains of soap per litre of water. The copper soap thus formed in the fiber of the rope preserves it from rot even better than the tar, which acts mechanically to imprison the sulphate of copper, which is the real preservative.

THE TENACITY, ETC., OF SILVER.—The tenacity of silver has been studied by Matthiessen, and can be stated for comparison as follows: Alloy of tin and copper, 1; gold, 3.6 to 4.3; copper, 4.3; silver, 7.2; platinum, 7.2; iron, 13; steel, 30. It is so ductile that a grain of it can be drawn out 400 feet, and it can be hammered into leaves so thin that it would require 100,000 of them to make a pile an inch in height. Its conductivity for heat is to copper in the ratio of 100 to 73.9, and for electricity as 1000 to 954. Cast silver expands, according to Calvert, between 0 deg. and 100 deg. per Cent., 0.001991, and its specific heat is 0.05701. Although silver is a remarkably good conductor of heat, its power of radiation is very small, so that a silver vessel retains the heat of a liquid contained in it longer than any other metal.

ACID-PROOF CEMENT.—A cement for resisting sulphuric acid even at boiling heat may be made by melting caoutchouc at a gentle heat and adding, with constant stirring, from six to eight per cent of tallow. Then mix therewith enough dry slacked lime to make the whole the consistency of soft paste, finally add thereto about 20 per cent of red lead, whereby the mass immediately sets hard and dry. A solution of caoutchouc in twice its weight in linseed oil, aided by heating and the addition of an equal weight of pipe clay, yields a plastic mass which will likewise resist most acids.

HOW TO KEEP LEMON JUICE.—a. Keep the filtered juice, before it has passed into fermentation, without adding alcohol, in a bottle hermetically sealed. b. Heat the fresh juice not

compounded with alcohol in a vessel to the boiling point, and close while boiling. c. Compound the unfermented juice with 10 per cent of alcohol and heat as in b. d. Fill the fermented juice in bottles without an addition of alcohol and without heating. e. Heat the fermented juice without an addition of alcohol in a closed vessel to the boiling point, and close while boiling. f. Compound the fermented juice with 10 per cent of alcohol, and heat as in c.

PAPER BOTTLES.—Paper bottles were patented in this country in 1883. Their sale was not extensive at first, but now that European patents have been secured, covering nearly all fields of probable competition, the controllers of the patents, it is said, intend to manufacture the bottles in large quantities. In the item of freight alone they will effect a saving of one-third less weight than glass or stoneware, and are, on the whole, less liable to breakage. Paper being also an excellent non-conductor, fluids stored in airtight paper bottles will withstand a more intense degree of heat or cold than they could endure without injury in bottles of any other material.

TO MELT OLD RUBBER, such as old rubber car springs, scraps, etc., so as to be able to run it into molds for new work: Heat the india rubber with steam; the sulphur then discharges and the india rubber melts, runs into the hot water and collects at the bottom of the pot, while the vapor prevents it burning. The properties of the india rubber are thus sensibly modified; it becomes a blackish mass, liquid at the ordinary temperature, but drying in the air, and becoming then impervious to water. The material loses its elasticity, but is suitable for the preparation of gums or special varnishes for certain articles.

POLISHING AND FINISHING METALS.—To get the beautiful finish we see on the best work, take a piece of flour emery paper, well worn, and a little oil upon it, and when this has been well worked, a piece of wood flat upon the surface, with some fine crocus, will bring it up to a high polish, and if any deep scratches be there, you will at once observe them, and to remove, in all probability, it will have to be filed over again.

SHAPENING HEAVY IRON SLABS.—It is a feature in the manufacture of the enormous slabs of iron for the English turrets that they are bent to the required form direct from the rolls, and when at cherry heat. To bend such plates cold would give them a certain amount of brittleness, and render them liable to "star" when struck by shot.

## GOOD HEALTH.

## Mileage of the Blood Circulation.

In preparing lectures on vital or animal mechanics for a Cantor course at the Society of Arts, several practical points of new or renewed study have come before me, some of which are, I think, deserving of brief notice. One of these is the question of the mileage of the blood current of a healthy adult man, in whom the current shall be traversing the conduits of the circulation under the direction of 69 strokes of the heart per minute, at the assumed propulsion of nine feet at each left ventricular pressure.

The distance traversed would, I estimate, be at the rate of 207 yards per minute, or seven miles per hour, or 168 miles per day, or 61,320 miles per year. Supposing, therefore, that a man who has lived 84 years could have one blood corpuscle floating all that time round his circulating channels—as a planet circulates round a sun—that corpuscle would have performed at the close of the time named the grand tour of 5,150,808 miles. The heat generated by friction in this motion of the blood we may take as included in the normal constant of 98.45° Fah. What the excess would be when, as in fever, the rate of passage may extend to over double the normal, or 14 miles an hour, at full tension, can only at present be estimated on data which have to be formulated, and are, therefore, inexact. But here a most important field is open for inquiry, and includes the questions: 1. Is the excess of febrile heat in pyrexia due to increased pulsation at full tension? 2. Is the increased motion due to the high temperature? 3. Are both dependent on one common cause? We really know nothing about pyrexia until these questions are determined. A pigeon lives always at what in the human subject would be the highest pyrexia. Its temperature is 108° Fah.; its arterial pulsations are 140 beats per minute; and it has a surface of body presenting the fullest resistance to conduction. Does this truly pyrexial animal owe its normal high temperature to its rapid circulation? Does its high temperature give rise to its rapid circulation? Or, are the heat and motion dependent on one common undiscovered cause?—*The Asclepiad*.

PLAIN TRUTH ABOUT SMOKING.—Dr. Wm. A. Hammond, to a reporter of the *Tribune*, made some remarks on smoking by boys that deserve the attention of all young persons—and older ones: "If children smoke cigars they destroy their nervous systems before they are fully formed and render themselves liable to neu-

ralgia and various functional diseases of the brain which are certainly calculated to destroy their mental force. There is also some evidence to show that tobacco in young persons actually interferes with the development of the body in regard to size—that it stunts their physical system. It certainly impairs digestion, for they cannot use tobacco without spitting inordinately. The saliva expelled from their bodies is one of the most important of the digestive fluids, and the proper digestion of the food in the stomach is materially interfered with when there is not enough saliva left to mix with their food before it is swallowed. Again, it certainly impairs hearing and eyesight. I have seen several instances of young children having their eyesight injured seriously, if not irreparably, by the use of tobacco. The excessive use of tobacco is injurious to everybody, adults as well as infants, male as well as female."

THE STATE BOARD OF HEALTH.—We acknowledge the reception of the ninth biennial report of the State Board of Health for the fiscal years from June 30, 1884, to June 30, 1886. It has been printed at the State printing office in Sacramento, and comprises a volume of 282 pages. California was one of the first States in the Union to recognize the need of organizing a State Board of Health, and the work which that Board has done has fully proved its value, although its opportunities for usefulness have been largely curtailed by reason of insufficient appropriations for such work. The table of contents of this report, which occupies 10 full pages of small type, shows that the work of the board has comprised a wide range of subjects, all of which are valuable for the information and instruction of the people at large. It deals sparingly in statistics, and none but those absolutely essential to a publication of this kind have been admitted. The report deals largely in general sanitary information and instruction, and will, no doubt, do much to encourage more general attention in regard to public sanitary needs and to domestic hygiene among the more intelligent portion of our people. It is gratifying to observe that in many ways the public is gradually becoming better informed in regard to these important matters. The publications of the board, through its monthly and annual reports, and the encouragement which it gives to the newspaper press to take a more active interest in health matters, if properly seconded by needed legislation, will soon place California in an advanced position, not only in the conservation of life but in the repelling of disease as well, by means of all the knowledge and appliances which modern sanitary science has devised for the benefit of the human family. We shall take an opportunity from time to time to transfer to our Health Column some of the many valuable hints which a more careful examination of the report will doubtless bring to our notice.

TROUBLE IN THE HEAD.—Roaring sounds and whistling in the ears and deafness. I had been much troubled by roaring and singing in my ears and at times a whistling sound, especially when lying down, writes a correspondent of the *Boston Transcript*. An old and experienced physician whom I consulted told me to gargle my throat night and morning with hot and cold water. Have one tumbler of hot water, taking the water hot enough to scald the mouth, and one tumbler of cold water. Gargle first three times with the hot, then three times with the cold water. Do this three times, making nine times with each. In a short time I was cured by this very simple remedy. Many times I have wished it were better understood how often deafness is caused by the hardening wax in the ear. A great number of people doubtless suffer from what they believe is incurable deafness, old persons in particular supposing it to be caused by old age, when if they would consult any good aurist they would find it was merely hardening of the secretion of wax in the ears. This can generally be removed by a very simple and painless operation and hearing restored.

WHAT IS HUNGER?—The cause of the intense pangs experienced by a starving man is little understood, but it may be safely said that the pain is not produced, as has been popularly explained, by the grinding together of the walls of the empty stomach. Dr. Robert Wilson remarks that the theory of hunger may be thus formulated: Fasting produces a general change in the organism as a whole. This again brings about a specific change in a particular part of the organism—the stomach—of which the pain of hunger is the local symptom. Direct applications, such as a bolus of food, or even of clay, temporarily relieve the local feeling of a pain, by neutralizing the specific local changes to which that feeling owes its origin. Indirect applications, again, such as the injection of milk into the blood, correct the general alteration of the system produced by want of food. By doing so, they correct those local gastric changes produced by the general effect of fasting in the system—changes which render the local manifestations of hunger possible.

THE VOICE.—It is now generally maintained that the voice is formed exclusively in the larynx. All such terms as "head voice" and "chest voice" are incorrect and misleading. By aid of an instrument called the laryngoscope the organ of voice may be thoroughly examined, abnormalities detected, and note made of the affections which beset it.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Alameda.

**MAGNESIA MINE.**—Livermore *Herald*, Nov. 9: One of the tunnels of the Cedar mountain magnesia mine is now in 20 feet, or nearly 50 from the surface of the slide. The character of the formation continues about the same, the best deposit being found beneath the large rocks. Cross tunnels are being run in on the larger veins, as they are cut by the main drift.

**CHROME.**—Chrome is still coming in, with unfailing regularity. Four teams are engaged in hauling. N. Q. Patterson's and Patterson & Bagley's making daily trips. Pete Classen makes four trips a week and Ab. Meddenhall one or two. Bagley & Patterson vary the monotony of chrome by bringing in two loads of magnesite per week, or about seven tons. The chrome output is about six tons per day.

**BORAX.**—We were shown this week a sample of the borax from John Worth's recently-discovered deposit in the Livermore mountains. His claim is on the Big Salida creek, southeast of San Antonio valley and nearly 50 miles from Livermore. It is on a county road and but ten miles from Grayson. The borax is found in a bank on the creek and lies in thick veins of clay. A portion of it is white and a portion yellow. It is separated from the clay before being washed, and allowed to stand in mud-pools under the heat of the sun. The borax collects on the surface of the mud and is easily scraped up. It has been tried by our blacksmiths and pronounced better than that usually sold. Mr. Worth intends working his mine himself.

## Amador.

**SUTTER CREEK.**—Amador *Ledger*, Nov. 6: A few men have been added to the force at the Mahoney mine. Charles Smith has taken charge of the mill, and has one or two men at work getting it in readiness to start up. I hope next week to be able to report that everything is running full blast. It is reported on good authority that the Hammack mine, this side of Amador City, has been bonded to a wealthy company, and that operations are expected to be started soon. The building of the additional 10 stamps at the South Spring Hill mill is making slow progress, on account of delay in the delivery of the material. The lumber has only just arrived on the ground. Work will be prosecuted energetically from now on. A large ore bin has been built in the rear of the mill. In another month the additional stamps will probably be in motion.

## Calaveras.

**ARASTRA.**—Mt. *Echo*, Nov. 3: Robert Leeper is constructing an arastra on Crystal creek in this town. Mr. Leeper intends saving the flow of tailings from the Ulica mill, and work them over by arastra process. Having heretofore engaged in this process and meeting with good results, he concluded to erect the arastra now in course of construction, further down the creek. Times are growing better, activity is observable in all branches of business, quartz mills are starting up, a feeling of confidence is springing up and the indications are that next year will be an active and prosperous one.

**TUNNEL.**—Prospect, Nov. 5: The proprietors of the Peasey mine have run a tunnel so as to tap the ore vein in their mine, 400 feet below the point of former development, and find the rock fully as good as they have yet produced. The Union mine expected to have their mill running in two weeks from to-morrow, the 20th.

## Colusa.

**THE AUGER FINDS GOLD.**—Colusa *Sun*, Nov. 6: The railroad company is having a well bored at the town of Sites, in Antelope valley, and it was down Thursday 145 feet, without a sufficient supply of water. It had been all the way pretty much through slate. On Thursday afternoon, a large piece of quartz was brought up, which showed, so the men said, quite rich in free gold. We saw the piece of quartz and what appeared to be gold, but it was after sundown and we could not tell so well as if it had been light. All hands who had seen it by a good light agreed that it was a very rich specimen. As there is but little water in the way, it would pay to sink a shaft 150 feet and drift on a rich quartz ledge. Gold is found almost everywhere in the Coast Range, from Sulphur creek on the south to Elk creek on the north. It will be struck rich there some day.

## Inyo.

**DARWIN MINES.**—Inyo *Independent*, Nov. 6: Mining business at Darwin is fairly active. The Dehance mine is looking better now than at any time for months past. Ore shipments are hindered by scarcity of teams to do hauling, but a good deal of it is being taken out and will be got to the railroad in a week or two. At Lookout, Mr. Frank Fitzgerald has got the Modoc mine in better condition than it ever was before. This was a hard mine to work, as the ore had all to be followed downward and handled several times. Quite recently a tunnel was completed that taps the ore body at a good depth below the former workings; now the mine is much easier to work, and what is of great importance, it is well aired so the miners can work comfortably. Mr. Fitzgerald recently opened a mine called the Minute Gun that also looks well and is yielding ore steadily.

**THE GOLD STAR.**—Mr. W. W. Stowe, of San Francisco, Major Gillis and Mr. John Paterson arrived at Independence recently. They have become interested in the Golden Star mine, near Independence station. During the past few months several lots of ore from the mine have been shipped away and milling tests made. All of these were very satisfactory, and it was the result of these tests that induced Mr. Stowe to come here. The ore is gold bearing, free milling; it is a soft brown quartz, very easily worked. It is expected that a Huntington mill will work about 50 tons of the ore per day, and one of these will be put up. From the mine down to Owens river the distance is not great and the grade very easy; this admits of putting the mill where there is abundance of water. Mr. Stowe and Major Gillis have gone back to San Francisco; Mr. Paterson remains to conduct the work at the mine,

and get ready for putting up the mill. Mr. Stowe has been operating at Calico during the past few years with much success. He does not speculate in mining stocks, but works mines for what is in them. All who know him must conclude that the Gold Star must be rather a good thing or Mr. Stowe would not touch it.

**THE MARBLE QUARRY.**—Mr. Israel Luce is getting along very well with his work at the marble quarry. The mill building is completed, with a dwelling, boarding-house and office attached. Nearly all the framing for the shafting is finished and the track from the quarry to the mill is in readiness for the cars. The engine and boiler are in place and ready for work. Every effort will be made to get the marble ready for market at as early a date as possible.

**PANAMINT.**—Mr. Fairman recently made a trip from Panamint to Carson on business connected with the new mill he is building. He arrived at Independence on Wednesday, on his way back from Carson, and left next morning for Panamint. He reports making satisfactory progress with the mill. Delay was caused by a washout of the road in the canyon east of Darwin; but this is now repaired and teams are hauling machinery, material and supplies as rapidly as possible.

**TWO SAN CARLOS MINES.**—Register, Nov. 4: Tom Shaw and Charley Hoole a short time since leased two silver-lead mines belonging to S. A. Densmore, located near old San Carlos, opposite Independence. On Monday of last week they commenced work, and now have about a carload (10 tons) of \$100-ore about ready for shipment, showing an average output of about 1500 pounds per day for the two men. One of these mines, the Confidence, shows full 24 inches of ore; the other, the Chalfant—named after a San Francisco Chalfant, not this Register man—is smaller but richer. The shaft on this ledge is down 90 feet, and the shipping ore from both mines is nearly solid galena and quite rich in silver.

## Mono.

**THE STANDARD CON.**—Bodie *Miner*, Nov. 8: Men employed in and about the mine: Engineers 2, pumpman 1, shiftboss 1, carpenter 1, blacksmith 1, miners 26, carmen 5, stationmen 3, timbermen 2, laborers 2; total, 44 employed. Ore stops and drifts looking very well. Ore shipped to mill, 296 tons. Mills running steadily on ore and tailings. Bullion shipment was made on Tuesday, 2d, of cleanup for October.

**THE BULWER CON.**—We shipped to the mill 350 tons of ore; average pulp assay, \$31.15. We shipped to San Francisco on the 1st instant \$16,520.88. There were employed 30 miners, 5 carmen, 1 timberman, 1 blacksmith, and 1 blacksmith helper at \$4 per day; 1 night foreman at \$5 per day; 1 foreman at \$6 per day.

**THE MONO.**—We are taking out good ore below the 700 level track. There were employed 2 miners at \$4 per day, and jointly with Bodie Con., 3 engineers and 2 firemen, 1 watchman, 1 blacksmith, 1 blacksmith's helper and 1 carman at \$4 per day, 3 carpenters and 1 foreman.

## Nevada.

**GOOD QUARTZ FROM THE BADGER.**—Grass Valley *Union*, Nov. 4: The ledge in the shaft of the Badger mine is now beginning to show finely in free gold and heavy sulphurets at the depth of 200 feet. The ledge is yet small, but the walls are four feet apart, and a strong vein is expected at a lower depth. Since the mine was started up by the new company the shaft has been sunk 90 feet. No other work is being done at present than to sink the shaft, but drifting will be done as soon as the ledge shows sufficient strength. From the appearance of the quartz now coming out there is every reason to believe that a rich pay chute is being opened upon. The hoisting and pumping at the Badger is done by water power, and all the operations are conducted very economically. When the old shaft was first pumped out a heavy flow of water was encountered, requiring the pumps to be driven at the rate of 15 strokes a minute, but at the present time only five strokes are necessary. The prospects of the Badger are now very flattering.

**THE NORTH STAR MILL.**—The work on the new North Star mill is making rapid progress. A large force is engaged, and the continued favorable weather is a great aid in expediting the work. It is confidently expected that the mill will be completed within the contract time, Dec. 25. The mill will not be surpassed by any in the State, as it will contain all the latest improvements.

**NOTES.**—The Coe mine is prospecting finely. A two-foot vein is showing in the drift being opened by Mansau & Co. In the North Star mine the ledge in the shaft at the depth of 1490 feet is four feet in size and shows well in free gold. This is an important development and very encouraging for the future of the mine, which is already giving large returns. The ledge in the Empire mine at the depth of 1600 feet shows a width of three feet, and the quartz is of fine quality.

**BAR OF PURE GOLD.**—Nevada *Transcript*, Nov. 4: J. J. Ott turned out a beautiful bar of gold at his assay office yesterday weighing over 100 ounces. It was very pure, assaying 940 fine. The reporter tried to find out from what claims the gold was taken, but Mr. Ott was "mum" on the subject, simply remarking, "there's plenty more where that came from."

**BOSS.**—North San Juan *Times*, Nov. 6: The Boss mine is doing well. The rock grows richer the deeper the mine is penetrated. The owners are jubilant over the prospects. The Boss company have recently covered their mine and shaft and are prepared for winter work. Success to the Boss mine, say we.

**MAYBERT ITEMS.**—Foothill *Tidings*, Nov. 6: A correspondent writing from Maybert, Washington township, this county, gives these items: A few days ago, M. Baugh, of Maybert, located a quartz claim on Canyon creek; a few days after the location he sold the claim to B. J. Watson for \$1000; in about 24 hours Mr. Watson disposed of the claim for \$1500. On Wednesday Mr. Baugh and his brother started on a trip to the Eastern States. J. D. Waters has returned to Maybert from San Francisco and will proceed immediately to the development of the Grafton mine.

**THE NORTH BLOOMFIELD.**—Nevada *Transcript*, Nov. 7: The question of how to work certain hy-

draulic mines without transgressing Judge Sawyer's illiberal anti-mining injunction appears to have been finally satisfactorily answered at the North Bloomfield Company's claim in this county. Some time ago it was announced in this paper that an apparatus had been constructed there for the purpose of working by the elevating process, which has already been described at length in these columns and which is generally understood by our readers. The first experiments made in this line were unsatisfactory, but numerous changes have been made until the best of results have been attained. The debris can now be readily raised to a height of 85 feet, which permits of its being deposited in the depressions caused by former workings, where it is securely impounded. Only the muddy water escapes into the river, and this carries so slight a solution of mud that it can do no essential harm. The company will not begin working regularly by the elevator process until the permission of the enjoining court to do so is obtained. It is believed there will be no difficulty in obtaining the privilege.

**HORSE SHOE.**—Grass Valley *Union*, Nov. 9: The Horse Shoe mine is looking well on the 200 level. The ledge is more regular than it was in the shaft, and nearly all the quartz taken out shows well in free gold. The strike of rich quartz in the Badger is drawing general attention to the mine. Some of the stockholders believe that it is the coming big mine of the district.

**THE COUNTY.**—Mining men have been visiting the county in greater numbers this season than for years previously, and all portions of the county have received their attention. It is gratifying to know that practical mining men have a high opinion of the mineral resources of the county, and these visits promise to be productive of good in turning the attention of mining investors to the county.

**THE QUARTZ REGION OF EUREKA TOWNSHIP** is beginning to receive attention. The quartz lodes of that section are numerous, and as a rule, wide. The ores are of low grade, but there is an opportunity of obtaining cheap water power from the canals.

## San Diego.

**GOLD FIND.**—Cor. San Diego *Sun*, Nov. 5: Considerable excitement has been created hereabouts, of late, by the discovery of a fine 12-inch vein of gold-bearing quartz, near the old gold mines about two miles from town, the facts of which have not before been given to the papers. One assay last week showed one dollar in gold to one pound of rock. Scarcely a piece of rock can be taken from the ledge in which free gold is not visible to the naked eye. A shaft has been sunk 20 feet upon the vein and it shows the vein widening. Work is still progressing, and it is reported that arrangements are being made to push it and open up the mine, also to put in a 10-stamp mill soon. This ledge is upon the Escondido ranch.

## San Bernardino.

**PROVIDENCE MINES.**—Calico *Print*, Nov. 2: The Bonanza King mine is still shut down. Kerr & Patton's mines have changed hands and the Messrs. Bahtens, of your place, are in charge. They have already commenced grading for a five-stamp mill, Mr. G. Bahten being in charge. It is expected that this new company will be running their mill by Christmas. A new find on the west side of Providence, with the singular name of Grey Hound, is looking exceedingly well, the owners having already about 50 tons of ore out, and they claim to have 1000 tons in sight. The ore is similar in character to the Bonanza King and is likely to prove another bonanza. The Arrow Gold camp which has been idle during the heated season is likely to soon make itself heard from again.

**MESCAL MINING CAMP.**—Your occasional correspondent has visited the Mescal mining camp twice lately, and was gratified to see the substantial improvements made. Mescal mining camp is about nine miles south of Ivanpah and about 49 miles north of Providence. The place is supplied from Fenner station on the A. & P. R. R., with freight, being about 70 miles.

**THE CAMBRIA MILL AND MINING CO.**—This is a Los Angeles corporation of a few shrewd business men, who bonded the Cambria group of mines owned by Sim A. Barrett and W. A. McFarlane. The owners with much pluck and grit opened up their mine under many difficulties, but were rewarded by the showing up of one of the finest mines in Southern California. The L. A. Company have appointed L. W. Carr their superintendent, and Mr. Barrett was prevailed upon to remain in charge of opening up the mine, which he has done with apparent success. There are now on the dumps some 500 tons of ore, with a very large area of virgin stopping ground, the stopes that they are now working showing over five feet of splendid ore.

**THE NEW FIVE-STAMP MILL.**—This mill is about completed with all its surroundings. The mill was built by the Baker foundry in Los Angeles and is the first mill erected by them. By the time this is in print, the stamps will likely have commenced to pulverize, and in a very short time another white metal mill will be producing bullion. Everything about the mine and mill is put up in a substantial manner, showing it has come to stay. There is at least two years' run of ore in sight in the mine. Mr. W. A. McFarlane is to be in charge of the mill.

**ORO GRANDE.**—San Bernardino *Courier*, Nov. 6: Mr. H. L. Atwood, of Oro Grande, favored us with a call yesterday. Mr. Atwood is the owner of several valuable mines in the Oro Grande country; among others the Vermont, a gold-bearing quartz ledge which gives indications of great richness. He brought quite a quantity of the rock to town, which experts, among others Mr. Brunn, pronounce extremely rich. Mr. Atwood will work the mine "to a finish" from this day onward. We trust he will meet with the reward his intelligent enterprise deserves, for he is a sterling man, an anti-monopoly Democrat of the first water, and as we know from his experience, one of the best of neighbors.

**HOLCOMB VALLEY.**—San Bernardino *Index*, Nov. 5: John Broadwater, who has been polishing a drill and igniting the fuse at the Zaragoza mine in Holcomb Valley for C. L. Metzgar, arrived in the city yesterday. Mr. Broadwater brings the information that the Zaragoza, Dandy, and Maxwell mines, the property of the Metzgar brothers, are developing far beyond the most sanguine expectations of the owners. Leading from a small vein of ordinary ore, the Zaragoza has developed into a veritable bonanza, and its success will go far to encourage legiti-

mate mining in Holcomb valley. The Dandy and Maxwell are good properties and will make a stir in mining circles when further developed. Mr. Broadwater says there will be more men employed in and about Holcomb valley, in the mine, this winter, than for many years past. Prospecting is being done in the whole country round about, and a large number of men are at work. The Sam Baird property will, no doubt, fall into the hands of a moneyed company, and give employment to a large number of miners. Mr. Godfrey, superintendent of the Green lead mine, has commenced operations in earnest, and now has 14 miners under him. The Cox mine is being worked and good results will most undoubtedly follow.

## Plumas.

**THE GLAZIER MINE.**—Greenville *Bulletin*, Nov. 2: From Mr. J. D. Baker, who came over from Big Flat, Sunday, we learn that the lower tunnel in the Glazier mine is in 375 feet. At the end of the tunnel an "upraise" was made to gravel. Only a few carloads of gravel have been removed from the "breast" of the drift. This was washed, and it yielded \$5 to the car. The gold is of the same character as that obtained from the old works further up the channel. The lower tunnel will be continued forward, and made to tap the bed of gravel. This tunnel will ultimately connect with the old works. The company have completed over 2000 feet of flume to supply water for washing gravel and for running a "blower" to furnish air in the mine. It will be about a month before "breasting" will begin. Mr. Baker thinks the mine will be richer in the lower works than it was in the upper. He informs us that considerable money is being taken out in that section of the country. Word comes from the North Fork country that the Sunny Side mine is paying big. We are glad to hear this, and hope the miners will continue to find lots of the "filthy lucre."

## Shasta.

**MILL.**—Shasta *Democrat*, Nov. 3: Paul's new 12-stamp mill, in Old Diggings district, is under way of construction. Jack Conant cleaned up, from the Uncle Sam, 75 ounces of gold bullion last week. Small reduction works are to be erected at Lower Springs, by Messrs. Skinner & Atkins. The machinery for Rely & Matthews' 10-stamp mill, to be erected on their Squaw Creek mine, was shipped from San Francisco last week. A 10-stamp quartz mill will be erected on the Muchmore mine at Lower Springs, as soon as possible. All the machinery has been ordered. Bill O'Neal, an old miner who has lived near Centerville for the past quarter of a century, died last Thursday, of hemorrhage of the lungs. Last week, Tom Greene came down with a big gold brick. Tom says his five stamps will be increased to ten right away, and has ordered the machinery.

## Sierra.

**PROMISING.**—Sierra *Tribune*, Nov. 5: That the mining district in and about Sierra City is the most promising in the State is a fact conceded by all mining men. No district can be found where the mines give better promise of permanency and richness than here. The Calico mine is about to be incorporated. The prospects at this mine are said to be excellent. It is stated that a six-foot ledge has been discovered at the Cleveland, the rock from which will mill \$6 to \$8 per ton. Only 30 stamps have been running at the Young America for the past two weeks, because of the lack of water.

## NEVADA.

## Washoe District.

**CON. CALIFORNIA AND VIRGINIA.**—On the 1300 level the north drift from the station in the Con. Virginia shaft has been advanced about 60 feet; total length, about 186 feet. On the 1435 level the drift running south from the north end of the mine has been advanced 55 feet; total length, 266 feet. On the 1500 level the drift running north from the Con. Virginia shaft was advanced 24 feet; total length, 266 feet. The drift running south from the Con. Virginia shaft is out 280 feet from the shaft station. On the 1300 and 1400 levels in California ground, good milling ore is still being extracted from both levels. During the past week about 2500 tons of ore were shipped to the Morgan and Eureka mills on the Carson river. The average value of the ore milled during the week, according to the assays from the batteries, was about \$39 per ton. During the week bullion to the value of about \$90,000 was shipped below through Wells, Fargo & Co.'s express.

**UNION CON.**—On the 700 level west crosscut No. 1 has been advanced 30 feet; total length, about 232 feet. The joint Mexican and Union west crosscut, at the south line, was extended 29 feet; total length, 269 feet. On the 1300 level the joint Mexican and Union drift, started north from the station in the Ophir shaft, is out about 50 feet.

**BEST AND BELCHER.**—The northwest drift has been advanced, making the total length about 500 feet. On the 800 level a north lateral drift has been started. The 600 level is being repaired and retimbered, and they are working east. The work during the week has been divided between the east and the northeast drifts.

**CHOLLAR.**—The set of boilers taken from the Combination shaft has been set in place at the old Chollar shaft, and the work of timbering the shaft still continues. It is the intention of the management to repair the shaft down to about the 1000 level, and to prospect between that point and the 350 level above.

**ALPHA.**—Operations will be resumed from the 300 to 900 levels through the old shaft as soon as the work of retimbering is completed, which will take some time, as the shaft is very much out of repair. From this shaft the Exchequer will also be prospected instead of through the Imperial shaft as heretofore.

**ALTA.**—No new developments have occurred since last week's report. The upraise from the 700 level is still passing through quartz giving low assays. The north and south lateral drifts are still running along the hanging wall of the Keystone vein.

**SAVAGE.**—The south drifts on the 600 and 825 levels are being pushed rapidly forward to connect with the Savage shaft in order to increase the air supply.

**GOULD AND CURRY.**—The work of retimbering

he main west drift on the 425 level in the Bonner shaft is almost completed. The south drift from the main west drift has been cleaned out and retimbered a distance of about 100 feet.

**HALE AND NORCROSS.**—The old hoisting works on F street are still undergoing repairs preparatory to the resumption of active operations, between the bottom of the shaft, which is down to the 1300 level and to the 500 level.

**OCCIDENTAL.**—Ore to the extent of about 10 tons has been extracted from the upper tunnel. The upraise has been advanced about 54 feet from the lower tunnel, and is still in quartz giving low assays.

**SIERRA NEVADA.**—On the 520 level west crosscut No. 5 from the north lateral drift has been advanced 30 feet; total length, 118 feet. The face is in quartz formation.

**UTAH.**—*Enterprise*, Nov. 6: The main west drift started from the station in the shaft on the 472 level has been advanced 59 feet; total length, 260 feet.

**MEXICAN.**—The operations here are confined to extending the joint Union Con. crosscut and the joint Union north drift on the 1300 level.

**CROWN POINT AND BELCHER.**—The ore shipments from the upper levels will average about 210 tons per week.

**OSBISTON SHAFT.**—The 2400 level is now flooded with water, and all work in the shaft stopped.

**OPHIR.**—On the 1200 level the station has been completed, and drifting will soon commence.

**YELLOW JACKET.**—About 150 tons of ore per day are daily shipped from this mine.

**KENTUCK.**—The ore shipments during the past week average 42 tons per day.

#### Barbee District.

**THE GOLDEN JACKET MINE.**—*Silver State*, Nov. 3: The Golden Jacket Mining Co. have a force of men prospecting their mine in Barbee District in the Humboldt Range, about four miles from Humboldt house. Reports from the mine are to the effect that the prospects are very encouraging, and the indications for a valuable mine are very favorable. The owners are mostly San Francisco men, though L. A. Blakeslee and other residents of the county have large interests in it.

#### Cherry Creek District.

**EXCHEQUE.**—*White Pine News*, Oct. 30: The Exchequer mill has been shut down for a few days for repairs, but it is in full blast again, with plenty of good ore on the dump. The company to-day shipped four nice bars of bullion to San Francisco.

#### Columbus District.

**CANDELARIA WATER-WORKS AND MILLING.**—*True Fissure*, Nov. 6: The mill has been shut down for a couple of weeks to make necessary repairs and improvements. It will resume operations on the morning of the 15th. The building for the hoisting works at the Georgene mine has been completed and the men are now waiting for the machinery, which was shipped from San Francisco yesterday. About 15 men were added to the mining force last evening under Dick Creer as shift-boss. A great deal of ore is being taken from the tunnels. The work of sinking the shaft will begin as soon as the machinery can be put in place.

**OVERLAND AND MIKADO.**—A trial lot of ore will be shipped to Fleming's mill at Columbus, for reduction. These are very promising properties, and with the aid of capital to develop them properly, could soon be put on a paying basis. The ledges are well defined and wherever opened up the ore has given good assays.

**GOLD MOUNTAIN.**—A great deal of work is still being done in this district and considerable bullion is being shipped from the different mines.

**MOUNT DIABLO.**—The company is still figuring on its mill and pipe line at Soda Springs, and work is expected to begin before long.

**HOLMES.**—It is rumored that if silver will keep up its rising tendency this mine will still resume full operations.

#### Eureka District.

**ORE SHIPMENTS.**—*Eureka Sentinel*, Nov. 5: During the past week ore shipments were made from the mines of the district to the two reduction works in town, as follows: To the Richmond works—Silver Lick mine, 19 tons; Members, 7; White Pine, 10; Antonazzi, 15; Dead Broke, 15; Grant, 2½; Phoenix, 21; Geddes and Bertrand, 2½; Williamsburg, 13; Bullwhacker, 8. To the Eureka Con. works—Altoona mine, 46 tons; Pittsburg, 1; Geddes and Bertrand, 15½; Oriental and Belmont, 6½; Woodchopper, 4½.

#### Jackrabbit District.

**ONONDAGA.**—*Pioche Record*, Nov. 1: Six tons of ore were shipped on Monday from the Onondaga mine, making the last of a carload. This mine is getting in condition to work to advantage, and hereafter is expected to yield big returns to the stockholders. When the mine starts paying dividends, they will be of such a character as will prove a blessing to the hungry owners. All who have visited the mine speak highly of it.

#### Philadelphia District.

**ORE BUT NO MONEY.**—*Belmont Courier*, Nov. 1: A revival of mining is what is wanted in Philadelphia District. The ore is there but the money necessary to open the mines properly so that it may be profitably extracted is unobtainable while the silver market remains so depressed. Free and unlimited coinage of silver would put new life into every industry of the United States and make Nevada the wealthiest State in the Union. Nye county is rich in mineral, of almost every known variety, which will for many years pass by make it one of the most prosperous and populous counties in Nevada. The people of Nye have unlimited faith in its future.

#### Sprucemont District.

**SHUT DOWN.**—*Elko Free Press*, Nov. 5: The smelter is shut down for two or three days, for slight repairs. It has been turning out bullion very fast for some three weeks. The present furnace manager, Mr. Gordon, is thoroughly posted in the art of running a smelter, consequently it is working better than ever.

#### Tuscarora District.

**BELLE ISLE.**—*Times-Review*, Nov. 5: Join Belle Isle and Navajo crosscut has been advanced

18 feet. A joint crosscut has been started east on the same level.

**NAVAJO.**—No. 1 winze, east vein, 350-foot level, has reached a depth of 55 feet, and a drift has been started north to determine the length of the ore chute. No. 2 winze on the east lateral vein, same level, has been sunk eight feet and shows some improvement. Drift north from east crosscut 150-foot level has been advanced 12 feet, and shows a good width of vein and a low-grade milling ore. Drift south on west vein, same level, has been extended 12 feet.

**NEVADA QUEEN.**—North gangway, 150-foot level, has been extended during the past week 20 feet; total, 42 feet. Formation has seams of quartz showing mineral, with a light seepage of water. Expect to be in far enough to start crosscut to cut the east or North Belle Isle vein in a week or ten days. Drift from No. 2 shaft has been started and driven four feet. This drift was run partly in the footwall, only the top exposing 12 to 14 inches of the vein. Have turned so that a few feet more will be entirely in the vein. Have two feet of fine ore in top of drift. Cannot tell how much more until the drift is further into the vein. In drifts from No. 1 shaft, with the exception of timbering, no work has been done since stopping on account of water. Will start drifting on ore toward our south line as soon as hoisting works are ready, which will be on the 8th or 9th inst., as the house will be all inclosed to-day. Engine, boiler and reels all in place; connections, etc., will all be finished by Monday. Will start sinking to connect with 150-foot level immediately after we get running.

**NORTH BELLE ISLE.**—Main gangway drift north on the 300-foot level has been driven 40 feet since last report; total length, 193 feet. Small seams were crossed by the drift the past week, from which good assays were obtained. This can be considered as certain evidence of the vein being well mineralized on this level. The formation is of the character most desired. Good progress has been made with all the work on the 150-foot level. The greatest improvement to note the past week has been in No. 2 winze. The ore that is being followed down continues strong and of a high grade. Shots in the footwall side of the winze disclose a mass of ore to the east of unworked richness. Several feet is exposed but not its full width. At the depth of 100 feet a crosscut will be extended to the footwall, to determine the width of the ore in this portion of the vein. No. 1 winze has been sunk to the depth of 65 feet and continues in good ore. The necessary preparation for future workings in and about the mine is being forwarded as rapidly as possible. Certain improvements to be made on the mill for handling this grade of ore will be commenced tomorrow and finished as soon as possible.

#### Tybo District.

**A REVIVAL EXPECTED.**—*Belmont Courier*, Nov. 1: The people of Tybo feel confident that a revival of mining in that section is not far distant, and they look for livelier times than were ever experienced in the palmist days of that famous and once lively camp. We hope that their fondest expectations of Tybo's future greatness will be realized.

#### White Pine District.

**BULLION SHIPMENT.**—*White Pine News*, Oct. 30: The Eberhardt-Monitor Mining Company shipped this week through Wells, Fargo & Co.'s Express, two bars of bullion, valued at \$1500.

#### ARIZONA.

**ORE.**—*Prescott Courier*, Nov. 3: W. A. Rowe is prepared to ship a carload or more of rich ore from the Davis mine, Hassayampa district. It will go to Argo, Colorado. Col. Bigelow, of same district, is waiting, patiently, for a home smelter, or the advent of the railroad, so that he can operate his mines with profit. Frank Kuhne has brought to Bones' ore-rooms several hundred pounds of good-looking ore from his Zalida mine, seven miles east of Prescott. John Hutchins, a well-known prospector and miner, returned, recently, from Silver Mountain district, with rich-looking ore from the claims of Wm. N. Kelly and T. S. Bullock, on the Mammoth mine, which is the biggest mine ever seen by the writer. Now that the election is over, the *Courier* would like to see all people put their shoulders to the wheel and turn her for active mining and reduction works, or even a sampler, so that owners of ores can turn them into money. There are upon the dumps of mines near Prescott nearly, if not quite, a million dollars. We need this amount and all, regardless of everything, should unite in one grand effort to realize upon our ores. Let us have a grand meeting and see if something cannot be done to make the mines respond to the wants of our people.

**OLIVE CAMP.**—*Tombstone Democrat*, Nov. 5: Olive camp, 22 miles south of Tucson, not only keeps up its reputation as one of the best chloriding camps in the Territory, but it is rapidly going to the front as one of the most prosperous permanent camps. The mines are improving with depth and the ore grows richer, and every indication and development is full of encouragement.

**GLOBE.**—*Silver Belt*, Nov. 6: The appearance of silver as coatings and flakes on copper ore continues in the fifth level of the Globe mine, and forms a separate strata between other stratas of ore, indicating the presence of silver ore near by. It is thought probable that an argentiferous vein will soon be discovered, which, in that case, will greatly add to the value of the mine. We are also informed that the owners of the Globe, realizing the importance of cheapening the rate of freights, have signified their intention to materially assist in the construction of the narrow gauge road from Tucson, provided that assurance is given that it will be built to Globe. The owners of the Globe mine have purchased the Interloper, which adjoins the Globe property on its southeast side.

#### COLORADO.

**DETROIT AND WARSAW.**—*Georgetown Courier*, Nov. 5: J. King is industriously pushing a crosscut to develop the property.

**FREELAND.**—A contract to do 1000 feet of drifting has been let.

**BLUE RIDGE.**—Five men are employed in drifting on this vein and the East St. Louis, a cross vein.

**OHIO.**—An engine and hoisting plant are being

put in and other preparations being made to actively work the property.

**COMMONWEALTH.**—Disbrow & Co. are hoisting water from the old shaft preparatory to working it. Stanhope & Campbell are crosscutting for the vein.

**ANTELOPE.**—The mine shows a nice body of ore. A recent mill-run of nine tons from a 10-inch vein of solid ore returned 121 ozs. silver per ton and 55 per cent lead.

**HORSTMAN.**—Work had to be suspended a few weeks ago on account of bad air, since which air pipes and a furnace have been put in and work resumed at drifting on the lode and extending the tunnel.

**SEVENTY DOLLARS A DAY.**—Timmons & Co. had a mill-run from their lease on the Seven-thirty last Saturday, of 9½ tons of ore, worth over \$3000. It was the result of the work of two men for 21 days.

**LUCKY STAR.**—Mr. Evans has opened up eight inches of solid galena in this recent discovery. The property is on one of the precipitous slopes of Irwin's peak. It was surveyed for location by Mr. Frank Maxwell last week, and in doing the work he had to use a rope to guide himself over the precipices. The west end of the claim is 1000 feet higher than the east, and much of the ground is at an angle of over 40 degrees.

#### IDAHO.

**PROSPECTORS.**—*Boise Statesman*, Nov. 2: A good many prospectors have been in the hills north of the city during the past month prospecting for ledges. Several promising locations have been made, but none of them have been developed enough to determine the extent or value of the ledges. The prospectors have all come down to Warrens from the Alton mining district, in Idaho county, snow having become so deep as to preclude a further stay. It is thought that considerable prospecting and development will be made there during next season. It is probable that the Idahoan mine will declare only one more dividend this year, to complete \$100,000 during the season of 1886. The profits of the mine for the next three or four months will be used in development work. Next season, commencing with early spring, more ore than ever will be taken out and bigger dividends declared. A great deal of development work will be done in Sheep Mountain District and adjoining territory next year. The Dailey boys, John Lemp, George Baldwin and others all have good prospects in that district which they propose to develop next year.

**THE SMOKEY MINES.**—*Wood River Times*, Nov. 3: From miners just in from Smoky, the *Times* learns that nearly all the producing mines there have about closed down for the winter. The Carrie Leonard, which formerly employed nearly 100 men, inside and out, now employs but five, besides two leasers. At the Galore-Stormy group everything is shut down, and the tools and provisions locked up. The King of the West is still working, but it is not believed that this mine will attempt to ship ore this winter, as if it did it would be to the expense of keeping the road open without any assistance from the other mines. Smoky district may therefore be considered shut down until next March or April.

**THREE-FOOT BODY OF ORE.**—*Bellevue Herald*, Nov. 3: To report a strike in the Minnie Moore mine would seem like duplicating an item about every week, but the latest discovery in the bonanza is on the 500 west, where a body of ore was encountered the other day that is a continuation of the immense body of rich galena found above. This new strike is of about two feet of first-class galena, and one foot of splendid jiggling ore. Being in a vicinity where no ore had been found before, it is indeed encouraging, although it was looked for, and work has been pushed to uncover it.

#### NEW MEXICO.

**THE GOLD CAMP.**—*Cor. Denver Tribune-Republican*, Nov. 5: The hebra now coming in here from the more northern Territories bids fair to populate this mining region to an extent hitherto unknown, and while the boom may not reach the proportions of a Black Hills excitement there are many who believe there will be more stability and staying qualities connected with it. The gold placers at San Pedro are undoubtedly the richest now known in America, at least they are so pronounced by experts and prospectors recently arrived—while silver abounds, and the richest copper mine in New Mexico is here; still this is emphatically a gold region, and that metal occupies a position of overshadowing importance and occupies first place in the hearts of our resident countrymen. The attention of capitalists at the Eastern financial centers has already been called to the gold fields of New Mexico, and the profits that await the investment of brains and machinery in this favored region. Many of the conditions for permanent and successful mining enterprises are found here, and may be summarized as consisting of a climate that allows continuous operations throughout the entire year, proximity to a transcontinental route, the Atchison, Topeka & Santa Fe Railroad passing within 16 miles of Golden, and connected therewith by a good mountain road, making the transportation of machinery and supplies an ordinary matter. Board and the necessities of life are at cheaper prices than is generally the case in mining regions; these things, together with the inducements offered by the rich mineral wealth locked up in these hills, will induce an investment of capital here that will effect astonishing changes in the development of this region.

**SOCORRO'S BULLION PRODUCT.**—*Socorro Bullion*, Nov. 6: The Billing Works of this city produced during the past month of October 525 tons of high-grade bullion. The Graphic smelter of this city produced during the same period 222 tons of high-grade bullion. Total production of bullion in this city during the month of October amounts to 747 tons as against 617½ tons produced in the preceding month, a gain of 129½ tons.

**SMEILER.**—The Graphic smelter will soon blow in their new stack No. 3. This will very materially augment the bullion product of Socorro. Prospector Kelly was in the city Wednesday. He is having some ore sampled at the Graphic smelter from his Bonanza discovery on the summit of the Magdalenas. The ore consists of argentiferous gray copper, and this claim enjoys the distinction of being situated at the greatest altitude of any ore-pro-

ducing property in southern New Mexico, being close on 10,000 feet.

#### OREGON.

**PROSPECTING.**—*Jacksonville Times*, Nov. 5: Considerable prospecting is still going on in southern Oregon. Most of the miners of southern Oregon are now ready for the winter's run. It is not likely that work will be resumed at the Blue Gravel mines on Galice creek this season. A great deal of placer mining will be carried on during the coming season, if it is at all favorable. It seems as if the cold snap will this time precede the rains that the miners are so anxiously looking for. Illinois river has raised enough to enable Wimer & Sons to resume pining at their hydraulic mines near Waldo. Brown Bros. have again rented Wm. Bybee's placer mines on Rogue river and are engaged in rigging them up. Work is still progressing on the tunnels which will tap Green Bros.' ledge on Galice creek, and it will be two months before it is completed. There is every probability that good results will ensue. Brown & Co.'s mill in Rock Point precinct, on the site of the Swinden ledge, which has lately been enlarged and improved, was started this week and is said to work well. The crushing of a large amount of excellent quartz is next in order. E. S. Smith & Co. have commenced running a tunnel to tap their quartz mine on Grave creek, which will probably be 500 feet in length. The ledge is already defined and the ore of a promising character. It is believed that it will prove both extensive and remunerative.

**ROGUE RIVER.**—*Cor. Roseburg Plaindealer*, Nov. 5: As yet this country is comparatively new to the outside world with regard to its mineral wealth, as but very little prospecting has been done outside of the bars that have been formed along the banks of the streams and rivers that contain more or less gold. All of the streams have cut their way down through the mountain sides so that in many places it is impossible to get through the deep canyons with any convenience, being filled with rock and large boulders that have rushed down from above and settled themselves in their rocky bed, here to remain as a barrier between the poor prospector and that which men call gold. Judging from the amount of gold found in all streams and bars along Rogue river, there must undoubtedly be some very rich gold veins found, for there is no disputing this fact in all mining countries where even rich placer diggings are found, there has been found also rich gold veins sooner or later, and I think there is no better country for prospecting to-day than there is from the mouth of Rogue river up for 100 miles or more, and this whole country is interlaced with a perfect network of veins, not only gold, but silver, copper, lead, iron, antimony, nickel, tin, bar and coal, and where nature has bestowed such an abundance of her wealth of this sort for the benefit of mankind, with one of the finest climates there is on this continent. When this portion of southern Oregon which includes the Umpqua valley becomes known to the outside world it must become one of the richest and most prosperous portions of the United States.

#### UTAH.

**REVIEW.**—*Salt Lake Tribune*, Nov. 5: For the 10 months of the current year the receipts of bullion in this city (excluding all ore receipts) have been as follows: January, \$328,852.66; February, \$456,024.03; March, \$469,722.63; April, \$519,666.08; May, \$387,891.49; June, \$527,036.97; July, \$585,644.38; August, \$480,141.49; September, \$491,129.32; October, \$377,104.59; total, \$4,623,262.64. The product of the Ontario for the month of October was 63,935.92 ounces of fine bullion, and \$46,356.34 from sales of ore; an approximate value for the month of \$110,292.26. Added to the previous nine months' output of \$1,273,964.11, the output to October 31st inclusive, for 1886, is \$1,384,256.37. Out of this 10 regular monthly dividends of \$75,000 each have been paid, a total in dividends of \$750,000 for the 10 months of this year. The daily output for October was 50,851.17 fine ounces, and ore sales to the value of \$8309.78; an approximate valuation for the month of \$59,160.95; which added to the nine months' product of \$556,897.65, gives a valuation for the 10 months of 1886 of \$616,058.60. For the week ending November 3d, inclusive, the receipts of this city were valued at \$119,409.05, of which \$65,973.41 was bullion and \$53,435.65 was ore, being especially light in bullion. The previous week the receipts were \$130,041.90, of which \$83,621.21 was bullion and \$46,420.69 was ore. The output of the Ontario for the week was 18,800 fine ounces and four lots of ore sold, amounting in the aggregate to \$30,322.45; an approximate product for the week of \$49,122.45. The product of the Daly for the same week was 7220.77 fine ounces; no ore sales. Base bullion receipts for the week amounted to \$11,600; fine bars, \$38,007.41. The Hanauer smelter produced during the week \$16,276 in bullion. Ore receipts in this city during the week were \$15,027 by Wells, Fargo & Co.; \$26,215 by McCormick & Co., including \$3212 from the Queen of the Hills; and \$11,296.64 by T. R. Jones & Co.

**PARK NOTES.**—*Record*, Nov. 6: Early this week an 18-inch body of fine-looking lead and silver bearing ore was encountered in the face of the north drift of the Apex lower tunnel. This news caused quite a boom in the stock at Salt Lake. The stock jumped from 7 cents a share to 20 and is still on the advance. The strike has been expected for some time, and now that the ore body has been uncovered, it will be developed with all activity. No assays have been made on the new find yet, but the opinion of several experts who have seen the samples pronounce it good, rich stuff that will pay to ship. Supt. Chas. Read returned to Salt Lake yesterday with a lot of the ore, and from him it was learned that the usual force of miners would likely be kept at work all winter.

**THE ANCHOR STARTS UP.**—After about three months' inactivity, work on the Anchor was resumed Thursday morning. The new boilers have been put in position and steamed up, and timbers and other necessities got in readiness. The water in the shaft is up to within 100 feet of the surface, and with active work it will not be later than the new year before the 400 or 500 feet of water is pumped out and got under control. Thirty men constitute the force at the mine. Before the lapse of another year we would not be surprised to hear that the Anchor company had a mine—a good big one.

## IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 &amp; 655 Mission St., San Francisco.

E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.  
 NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

Centrifugal Roller Quartz Mill.

### F. A. HUNTINGTON,

MANUFACTURER OF

## Centrifugal Roller Quartz Mills, CONCENTRATORS AND ORE CRUSHERS,

## THE RISDON IRON AND LOCOMOTIVE WORKS.

Location of Works: S. E. Corner Beale and Howard Streets, San Francisco, Cal.

### BUILDERS OF

QUARTZ MILLS—Gold and Silver, Copper and Lead Smelting Works, Roasting Furnaces of all kinds.  
 AIR COMPRESSORS—Rope Power Transmission.  
 HYDRAULIC PUMPING and Hoisting Machinery.  
 WROUGHT-IRON WATER PIPE a Specialty. *NOTE*—Have just completed order for 35 miles of 44-inch pipe of 4-inch iron for Spring Valley Water Works Company, San Francisco.  
 SAW-MILL MACHINERY of all kinds.  
 STEAM ENGINES—Corliss, Slide-Valve, Poppet Valve Automatic, Single, and Compound.  
 SOLE MANUFACTURERS for Pacific Coast of the Celebrated "Heine" Patent Safety Boiler (Water Tube); 50,000 horse power now in use.  
 MACBETH PATENT STEEL-RIM PULLEYS—Fifty per cent lighter and 25 per cent cheaper than cast-iron pulleys; will not break in transportation.

REFRIGERATING MACHINERY for Steamships, Breweries, and Cellars.  
 WILSON'S PATENT GAS-PRODUCER.  
 STEAM BOILERS of all descriptions.  
 SUGAR MACHINERY—Sugar Mills, Vacuum Pans, Clarifiers, Double Effects, etc.  
 STEAMSHIPS—Steam Yachts, Marine Engines and Boilers, Screw Propellers, Centrifugal Pumps, Steamship Pumps, Steam Capstans, Cargo Winches, etc.  
 Builders of 120-stamp Gold Mill for the Alaska Mill and Mining Company; 60-stamp Mill for Quartz Mountain Mining Company.  
 Send for Circular and Price Lists.

## THE FRISBEE-LUCOP MILL,

## A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.  
 At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.  
 All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.  
 Certificates as to performance of the Mills, and any information required, furnished on application.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

PARKE & LACY, General Agents, San Francisco, Cal.

### THE GOLDEN GATE PLUG CLOSET.

The only secure-locking device to keep sewer gas entirely away from dwelling houses.

JOSEPH BUDDE, Manufacturer, 43 Fremont Street,  
All kinds of Water Closets, Slop and Waste Hoppers  
Always on hand. Write for information

### American Exchange Hotel,

SANSOME STREET,  
Opposite Wells, Fargo & Co.'s Express, one door from  
Bank of California, SAN FRANCISCO.

This Hotel is in the very center of the business portion of the city. The traveling public will find this to be the most convenient as well as the most comfortable and respectable Family Hotel in the city.

Board and Room, \$1.00, \$1.25 and \$1.50  
PER DAY, ACCORDING TO ROOM.

Hot and Cold Baths Free. None but most obliging white labor employed. Free Coach to and from the Hotel.

MONTGOMERY BROS., Proprietors.

### COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published relating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for \$2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

### AUGUST LUTZ, METAL SPINNER,

10 Stevenson St., 3d floor, S. F.

The only custom work spinner in the city. Personal attention given to all work. Orders respectfully solicited.

### THE CONSUMERS' COMPANY.

## VULCAN B B AND AJAX.

The Best LOW GRADE EXPLOSIVES in the Market.

SUPERIOR TO BLACK OR JUDSON POWDER.

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

**VULCAN POWDER CO.**

218 California Street, San Francisco, Cal.

## THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

**GIANT POWDER or DYNAMITE,**

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE, which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

**JUDSON POWDER IMPROVED.**

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

**BANDMANN, NIELSEN & CO.,**

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO, CAL.

## THOMAS PRICE'S ASSAY OFFICE,

CHEMICAL LABORATORY,

**BULLION ROOMS and ORE FLOORS,**

524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

## Metallurgy and Ores.

### SELBY SMELTING and LEAD CO.,

416 Montgomery St., San Francisco.

**GOLD AND SILVER REFINERY  
And Assay Office.**

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

Address care of DEWEY & Co., 252 Market Street, San Francisco, Cal.

### JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

**ASSAYERS' MATERIALS, MINE**

**AND MILL SUPPLIES,**

CHEMICAL APPARATUS AND CHEMICALS, DRUG GISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. C. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St., S. F.

## State Mining Bureau.

They have recently received at the Museum of the Bureau some peculiar and interesting ores from Australia and New Zealand. The Australian silver ores are very rich in bromide and chloride of silver in a gangue of kaolin, which also contains numerous small garnets. These peculiar ores are well worthy of examination by mineralogists. The collection is quite a complete one. The silver bromide is rather rare, though some is found in Chili and some in Inyo county, this State. This ore was assayed by Mr. Luckhardt, and runs 1500 ounces in silver to the ton.

There are also some pretty specimens of gold quartz; one is a set of 20 pieces from the district of Marmora, Canada.

Two quartz specimens from mines in Amador county were presented by Mr. Nevills. Besides, there are some specimens of gold quartz from New Zealand, yielding \$170 to the ton.

All the mineral specimens in the museum are being rearranged on a different system from that previously carried out. The State Mineralogist is working on his report, which will shortly be published. It is to be of a more practical character than those recently issued, inasmuch as it deals with practical matters of every-day use to the mining community.

Silver ores from Mexico, silver ores from Peru, and anthracite coal, Peru, from F. E. Monteverde.

Four specimens calcite and aragonite crystallized on basalt, Australia; fine rose quartz, Lake Superior; 13 crystallized specimens of sphalerite, galena and pyrite from Joplin, Missouri. Donated by J. Z. Davis.

Twenty-five specimens of gold and iron ores from Marmora district, Canada.

## Mining Accidents.

On Friday of last week an accident occurred in the Idaho mine, Grass Valley, by which three miners were injured. John M. Williams, James Cornish and Richard Steele were at work on the fifteenth level, when a cave occurred, injuring them all. James Cornish was at first thought to be killed. He suffered greatly from his injuries, his head having been badly cut, the bones of his right leg being crushed and his spine hurt so badly that his lower limbs are paralyzed. It is expected that he will not recover. Williams escaped with the fracture of some ribs and Steele's injuries were confined to the mashing of his fingers on his right hand, two of them requiring to be amputated.

On the 9th inst. Dennis Harrington was caved upon and severely injured while at work in the Consolidated California and Virginia mine.

One day recently James McGonigal was caved on in the Lone Star mine, Idaho, and it took the miners of the Tiptop, Donovan and other adjoining properties 14 hours to dig him out. Fortunately, the timbers in the tunnel saved his life, and only one foot was caught by the falling rock. The Lone Star is about one mile east from the Donovan group of mines, and was being worked by a lease at the hands of McGonigal and Cass.

## Mining Share Market.

Stocks have had a little setback this week, or rather they have been checked in their upward movement. Political questions have absorbed more or less attention and kept people away from the stock market. Interest seems to be centered in the Comstock mines, particularly Consolidated California and Virginia and Ophir. The daily output of ore from the Consolidated California and Virginia, as well as the battery assays, are about the same as last week—being 400 tons per day for the output or shipment, and \$39 per ton for the battery assays. Reports from the mine say: On the 1435 level the drift which runs in a southerly direction from the north end of the mine on this level has been extended 49 feet; total length, 265 feet. This drift has cut into good milling ore, which is, without doubt, the extension downward of the ore development on the 1400 level. On the 1650 level good milling ore has been struck in a drift which runs in an easterly direction from the old stopes at a point which is directly under the ore development on the 1400 level. Shipped to the Morgan mill 938 tons of ore which assayed \$28.85 per ton, and 1703 tons to the Eureka mill which averaged \$37.09 to the ton. Bullion to the value of \$76,544 was shipped to this city during the week. The Alta mine will be open for inspection in about a week or ten days.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.  
G. W. INGALLS—Arizona.  
E. L. RICHARDS—San Diego Co.  
R. G. HUSTON—Montana.  
GEO. McDOWELL—Fresno and Tulare Cos.  
O. F. BERGMAN—Tehama and Colusa Cos.  
J. H. SMITH—Plumas and Sierra Cos.  
J. C. SWENNEY—Sonoma and Mendocino Cos.

THE Queen of the Hills, at Wood River, I. T., has paid \$160,000 in dividends, and is producing bullion valued at \$25,000 monthly.

## Assessment Notices.

**Tallulah Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Sierra Mining District, Humboldt county, Nevada.

NOTICE is hereby given, that at a meeting of the Directors, held on the 30th day of October, 1886, an assessment (No. 21) of thirty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 634 Market street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 8th day of December, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Wednesday, the 29th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEORGE A. HILL, Secretary.  
Office—With Estate of Samuel Hill, 634 Market St., San Francisco, Cal.

**Acme Mill and Mining Company.**—Location of principal place of business, San Francisco, Cal. Location of works, Volcano Mining District, Amador County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 25th day of October, 1886, an assessment (No. 9) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Sec'y.

Office—Room 4, 309 California St., San Francisco, Cal.

**Aultman Mill and Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Georgetown Mining District, El Dorado County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 26th day of October, 1886, an assessment (No. 3) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Sec'y.

Office—Room 4, 309 California St., San Francisco, Cal.

**Santa Anita Mill and Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Nevada County, Cal.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 26th day of October, 1886, an assessment (No. 10) of one and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. M. BUFFINGTON, Secretary.  
Office—Room 4, 309 California St., San Francisco, Cal.

## Testing and Working Silver Ores

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroehne's process, etc. Under "Pulverizing Machines" are described the anstra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace mounds and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by Dewey & Co., Publishers, 252 Market St.

## HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

## About Obtaining Patents.

Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously patented, our client will receive, for the small sum of \$5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however, and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of \$20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds \$40, and for this we do all we can without appealing the case.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 26 years. Few agents, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications entrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily—when distant agents are employed—is wasted in preliminary writing back and forth.

This happy combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

Caveats.

A caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee is \$10 additional. To enable us to prepare caveat papers, we require only a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and a desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATING WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

### WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER OF INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY OF CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

### BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

## Evans' Compound Fly-Wheel Pump.

We give an engraving on this page of a large steam pump, made in this city by C. H. Evans for the Chico Water Company, and recently shipped. This compound steam pump has the well-known crank and fly-wheel movement of the Thomson & Evans patent; there are very many of this form in use on the coast. The pump illustrated is quite a large one, designed specially to meet the requirements of the Chico Water Company, where its ordinary work will be to raise 1,000,000 gallons of water per day, and discharge it into the reservoir at an elevation of about 70 feet. It is intended, however, in case of fire to adapt the power of the pump so the water can be turned directly into the city mains and maintain a pressure of 125 pounds per square inch, which is equal to a head of 290 feet. In order to be able to do this variable and exceptionally heavy service, the pump was made, as shown, extra heavy and strong, with the metal distributed in such shapes as are best calculated to resist the immense strain and yet have all the parts convenient of access for adjustment or repairs. Being made on the compound principle, when in ordinary use (pumping to the reservoir) the steam is first taken into the small steam cylinder, and after doing its work there is expanded into the large steam cylinder, thus getting the maximum of work done with the minimum of steam or fuel. When required for fire purposes, it is so arranged that the live steam can be turned direct into the large cylinder, thus increasing the power and maintaining the required pressure in the pipes.

The high-pressure cylinder is 12 inches in diameter and the low pressure 22 inches; the water cylinder being 13 inches; stroke, 18 inches. The suction pipe is 10 inches and the discharge 8 inches. The pump has to work against a pressure equal to 290 feet. This form of pump was selected by the water company's engineer after careful comparison with those of the best makers, as being the most reliable and economical for the purpose. These fly-wheel pumps have won great favor wherever used. The chief engineer of the Quartermaster's Department at Jeffersonville, Ind., who has had 33 years' experience with almost every class of pumps, considers the fly-wheel pump recently shipped to that place by Mr. Evans to be the best and least complicated he has yet seen. Mr. Ed. W. Hewitt, of the same department, also speaks highly of it, saying that it was given a thorough test, and he feels satisfied it will give more service with less wear than any direct-acting or fly-wheel pump he has seen. This gentleman had also experience with one of these pumps at the Presidio of San Francisco, while he was stationed here. At that

time he made crucial tests of its power and capacity, and he considers it the best and most economical pump he has come across in his long experience.

## Mining Accidents.

By the premature explosion of a blast in the Ohio mine, Rebel creek district, Nevada, Peter Swan, an old miner, had one of his hands badly mangled.

At the Stickle mine, Calaveras county, some of the men put off a blast in one of the chutes, and as it did not do the required work, Mr. J.

lowered down the shaft on the cage, and when about 100 feet from the bottom the cage began to rapidly descend, with poor Hambleton on it. He was found shortly afterward at the bottom in an insensible condition. The brakeman who had control of the brake at the time says that the brake, for some unaccountable reason, would not hold. Mr. Hambleton died after being brought out of the shaft. The coroner's jury attached no blame to the brakeman.

An accident occurred on Wednesday morning, at the Idaho mine, Grass Valley. While Joseph Palamountain, one of the shift bosses, was

## Closing Down of the Anaconda Mine.

The unpleasant news comes from Butte, Montana, that the works of the Anaconda Copper Mine have been closed down for the winter, a proceeding which will throw 1500 men out of work, and stop the production of 80 tons of copper a day. This mine is the most important copper mine in the United States outside of the Lake Superior region.

It must be understood that the smelter has been closed down for some time, but men were working on the new concentrator, etc. The men at the smelter, when it was running, received \$3 per day. It is stated that Mr. Marcus Daly, the manager, made a proposition to a committee of the Knights of Labor that if the old employees at the smelter would work for \$2.50 per day, the company would start up the works. A meeting of about 1000 of Knights of Labor was held, and refused to accept the proposition, whereupon the mine and the whole works were closed down, and all the men dismissed. Mr. Daly says the works will not be again started up before next May. The Butte Miner, speaking of the matter, says: It appears that many of the workmen who have families there were in favor of accepting Mr. Daly's proposition, as the merchants of the place had carried them along for some time, and they wanted work so they could pay their indebtedness. On the other hand, there were those— young men—better prepared to endure a season of idleness, who opposed the acceptance of any reduction in wages. The matter will probably soon be settled. It is understood that the leading business men of Anaconda are doing all they can to effect a compromise by which the workmen of the place may again obtain employment.

Notwithstanding rumors to the contrary, as far as we have learned, any reduction of wages at Anaconda—if such should be made—will in no wise affect the question of wages in this city. We have yet to learn of a single mine or mill owner in this vicinity who asks for or favors such reduction. The leading business men are opposed to it. They argue that with silver advancing in price and copper two cents above quotations two or three months ago, it would not only be unjust to the miners, but unwise on the part of the mill and mine owners to ask any reduction in wages. It is safe to say that a cut in wages in Anaconda will not be followed by a cut in Butte and vicinity.

A FIRE occurred at the Idaho mine, Grass Valley, which caused some damage, but nothing very serious. A fire at the Ophir hoisting works on the Comstock, the other day, was also extinguished before serious damage was done.

C. H. EVANS' COMPOUND FLY-WHEEL PUMP.

B. Meyers, the foreman of the mine, went with some powder to put in the seams that the blast had made in order to throw the remainder of the rock down. Before he had time to get out of the way of danger, a rock fell, striking Mr. Meyers on the head and knocking him senseless. On examination it was found that no bones were broken, but that he had sustained severe scalp and flesh wounds.

A case occurred in the Perseverance mine, Flint district, Idaho, which came near killing two men, Mr. Will Cates and Joe Vanina. They had examined the place in the forenoon of that day and thought it safe enough, but on going into the drift in the afternoon the ground came down without any warning, catching both before escape was possible. Mr. Cates' right leg was caught between a timber and one wall of the lode, which held him like a vise, and Mr. Vanina was covered with debris. They were dug out as soon as possible.

John Hambleton, a miner, while descending on the cage at the St. Lawrence mine, Butte, Montana, was fatally injured. It appears that after dinner Hambleton gave the signal to be

standing in the shaft at the 100-foot level, he heard a car coming, to avoid which he stepped out of its way on to the track on the opposite side of the shaft, where he was still standing when he heard another car approaching, but thinking it was the same car he did not move, and was struck by the second car, which was descending on the track on which he stood. It is thought impossible that he will live, as several of his ribs were broken, portions of which entered his lungs, and he was otherwise hurt internally.

Wednesday evening a miner named William Hooper had the ends of two of his fingers cut off by a car passing over them as he grasped the track while he was descending the shaft in the North Star mine, Nevada Co.

A cave on Wednesday in the Maybell drift mine, at Bloomfield, injured John Pridgeon so that he will probably die. A broken back, a deep cut in the neck and other hurts were sustained.

SAN DIEGO is now lighted by electricity. The motor power is water.

## The Minting of Gold and Silver.\*

NUMBER 2.

[By ALBERT WILLIAMS, JR.]

Melter and Refiner's Department, Carson Mint.

The crude bullion, after having been cast into shoe-bars and sampled, is transferred to the melter and refiner's department. From this point the melter and refiner is responsible for all bullion received by him until, after refining and casting into ingots of standard coin metal, it has been transmitted to the coiner's department.

The total force employed in the melter and refiner's department is nine men, including the following officers: Melter and refiner, assistant melter and refiner, computing clerk, foreman of the ingot-melting room, and foreman of refinery.

## Refinery.

The refinery occupies two rooms, 47 feet 4 inches by 23 feet 1½ inches, and 26 feet 10 inches by 18 feet 5 inches in size, on the west side and at the northwest corner of the second story. It is intended to transfer the refinery to the extension when the latter shall have been completed. The force employed is three, consisting of the foreman and two helpers. The work done consists in the following operation: *a*, Parting of gold from silver in dore metal by boiling with sulphuric acid; *b*, "sweetening" the parted gold; *c*, precipitation of silver from the acid solution of argentic sulphate by metallic copper; *d*, "sweetening" the precipitated silver; *e*, disposal of the cupric sulphate solution formed during the process of precipitation; *f*, as an adjunct operation, the manufacture of "silver-cake," that is, compressed silver precipitate.

First boiling with sulphuric acid.—This is done over four heating furnaces, arranged in two pairs. These are of common brick, lined with fire-brick. The fuel used is yellow pine, in sticks four feet long. There are four parting kettles, made of cast iron, 3 feet diameter at the top, 30 inches deep, 7-16 inch thick at the upper part, and 1½ inches thick at the bottom. The additional thickness below compensates for the greater exposure there, so that the wastage of iron is uniform. The covers of the parting kettles are also of cast iron, and are conical. They are half an inch thick, and are hung by chains from pulleys and counterpoised.

An essential point in the use of the sulphuric acid process is that the unparted bars should be of the proper tenor, which by long-continued observation is found to be a fineness of from 0.070 to 0.075 in gold to give the best results in parting. The unparted bullion treated at this mint is very irregular in character, the range being from 0.002 to 0.500 fine in gold. Bullion lately received contained only from 0.002 to 0.020 fine in gold. With this low proportion of gold, the latter, on the solution of the dore metal, forms a fine, impalpable powder, which floats on the surface of the acid in the kettle, and cannot be perfectly separated from the silver. This defect is corrected by adding gold in the previous melting. Unparted bullion 0.900 fine (in gold and silver) dissolves readily in the shoe-bar shape with or without breaking the bar into its three sections. These bars weigh, as previously stated, from 170 to 220 ounces each. It was formerly the custom when treating Comstock bullion, which, because of its fineness (usually above 0.990), volatilized perceptibly in melting, to protect it by adding a small quantity of very base bullion. Five pounds of lead bullion, containing also some iron, were added per charge. This practice, introduced by the melter and refiner, is said to have worked well. Latterly, however, it has been unnecessary, as the bullion treated has been of lower grade.

The usual charge of unparted bullion is 2500 ounces to each kettle. The proportion of acid is four pounds of sulphuric acid to one pound of unparted bullion. One-half of the acid, *i. e.*, two pounds to each pound of bullion, is placed in the kettle on charging, and the remainder is added gradually in pitcherfuls as the silver is taken up. The normal strength of the acid is 62° Baume, but if the unparted bullion contains much copper a slightly weaker acid is used. The temperature maintained is 650° F., the boiling point of acid of the normal strength. The time occupied in boiling is five hours. At the expiration of this period the fire is drawn and the charge is allowed to cool and settle for two hours. This interval is requisite for an additional reason, namely, that the operator may not suffer from the sulphurous acid fumes.

The method of discharging the kettles is as follows: As much of the parted gold as possible is first ladled out from the bottom; the acid solution of argentic sulphate is then siphoned off, and finally the remainder of the parted gold is removed.

Second boiling of the parted gold.—A further purification of the parted gold is next attained by reboiling it with sulphuric acid in smaller kettles over special furnaces. There are three of these heating furnaces, of the same type and dimensions. They have heavy cast-iron shells of octagonal shape externally and are lined with fire-brick. The interior is vertically cylindrical, and is 10 inches in diameter and 15 inches deep. The fuel used is nut-pine charcoal. The three reboiling kettles resemble

those employed in the first boiling, but are only 20 inches in diameter at the top and 16 inches deep. The acid is of the same strength, and the time occupied in reboiling is two and a half hours.

"Sweetening" the parted gold after the second boiling.—This consists in repeatedly washing the gold with hot water (not distilled) in a filtering tub. There are six of these filtering vessels. Two are porcelain jars made in Germany, and cost \$60 each. They are 20 inches in diameter and 24 inches deep. Four small wooden tubs, lined with sheet lead, are also used; but the porcelain jars are preferable, even at the increased cost, being free from the inconvenience caused by the incrustation of crystallized sulphates, which forms on the interior surfaces of the lead-lined wooden tubs. Porcelain, however, although undoubtedly the best material, appears to have the property, in a very small degree, of reducing silver from the acid solution of argentic sulphate—a point which is undesirable at this stage of the process. This is probably due to the solubility of the glaze of the jars, though the organic matter of the filter may also have the same effect. The straining material is unbleached muslin sheeting. The old filters are burned, the ashes being preserved and returned with the annual cleanup of the mint.

Third boiling and washing of the parted gold.—On the day following the second boiling with sulphuric acid and washing with hot water, the parted gold is subjected to a third boiling with acid and additional washings. The manipulations are a simple repetition of those just described. The gold is now in a state of almost absolute purity.

Avoidance of brittle gold.—Most refineries in which the method of parting by sulphuric acid is adopted produce brittle gold; that is, gold which cannot be rolled safely, and which requires careful annealing before passing the breaking-down rolls, and perhaps may not be sufficiently ductile even after annealing. Much trouble has been experienced at the San Francisco mint from this cause. The presence of the most minute quantity of lead impairs the ductility of gold, but does not affect silver in nearly the same degree. Lead is with difficulty removed when the parting of gold from silver is done by sulphuric acid. To entirely eliminate the lead which may be present a very simple and efficacious expedient has been hit upon, which consists in taking advantage of the difference in specific gravity between gold and lead and the minute subdivision of the particles of the latter. The filtering vessel in which the parted gold is washed with hot water is slightly inclined by the operator, and the lead particles are floated off with the washings into another tub. This plan of simple decantation succeeds so well that at the Carson mint the gold ingots do not require to be annealed before going to the breaking-down rolls.

Disposition of the parted and sweetened gold.—It is dried (without furnace heat) and sent directly to the ingot-melting room. There it is fed into the melting pots very carefully, to avoid loss by sputtering. Where large quantities are treated it is desirable to have the parted and sweetened gold pressed into cakes and dried in a furnace before melting, as is done with the silver at this mint and with both gold and silver at the San Francisco mint. After melting, the metal is sampled and cast into bars. It is then known as "mint-fine" gold; that is, gold as near absolute purity as is necessary in the subsequent processes.

Precipitation of silver from the acid solution of argentic sulphate by metallic copper.—In the parting of the gold from the silver of the dore metal the silver is attacked by the acid and appears as a sulphate held in a solution which also contains free sulphuric acid. Besides this solution there are also a wash-water of decantation and the filtrates formed in sweetening the parted gold. These contain considerable argentic sulphate, and are concentrated by evaporation before reduction. The next step in the process is the recovery of the silver in a metallic state from the acid solution of argentic sulphate. This is effected by precipitation on metallic copper, in four large wooden vats, rectangular in shape and lined with sheet lead. To prevent the escape of the fumes generated during the heating of the liquor the vats are inclosed in vertically-sliding wooden partitions, hung by chains from the ceiling and counterpoised, so that any portion of the interior is readily accessible for inspection or for any of the necessary manipulations. The vats are each two feet deep (interior measurement), and the other dimensions are from 6x11 to 9x12 feet. Laid around the bottom, on the inside of each vat, are three coils of leaden steam pipes, two inches in diameter, fed by live steam from the engine boilers, by which the solution is kept heated to about 180° F. The maintenance of a precise temperature does not appear to be essential to successful precipitation, and any near approximation to the point mentioned is found in practice to be sufficient.

The copper used is from the Lake Superior mines, and is refined at Baltimore, Maryland. Its fineness is something remarkable, being, by assays at the mint, no less than 0.9997, the 0.0003 of impurity remaining being chiefly iron. The form in which the copper has hitherto been employed has been the ordinary 20-pound ingot of commerce as received from the copper-refining works. The melter and refiner, however, has had molds prepared and forwarded to Baltimore for casting the copper in thin slabs, 6 by 12 by 1 inches, with the object of securing

a larger precipitating surface in proportion to the weight of metal used, and also with a view to increased convenience in removing the precipitated silver. The charge of copper ingots is 1000 pounds to each vat. They are laid across the coils of steam pipes at intervals of 8 inches. The slabs are intended to be placed on the bottom, forming a loose pavement, and also upright along the sides and ends of the vats.

In charging the precipitating vats, after arranging the copper ingots in position, undistilled cold water is poured in through pipes to a depth of from 12 to 14 inches. The acid solution of argentic sulphate is then added, bringing the contents to within about three inches of the top of the vat. With the system pursued at this mint the resulting dilution is about 18° Baume, which is considered the most advantageous strength. After charging, steam is turned on through the leaden coils, and the liquor becomes gradually heated to the desired temperature. The time required for complete precipitation is 24 hours of constant heating; but as the mint is ordinarily working during one shift of eight hours only, three days are consumed in this part of the process.

The method of determining whether complete precipitation has been effected is as follows: A small quantity of the acid solution is drawn off, cooled, and poured into a test-tube. A solution of sodium chloride (strength immaterial) is added. A white precipitate of argentic chloride indicates incomplete reduction; but if all the silver has been reduced, no precipitate occurs. These tests are applied from time to time by the operator, and show the progress of the precipitation.

To remove the precipitated silver from the surfaces of the copper ingots, the latter are scraped twice a day with long-handled wooden spatulas. No especial care is taken to remove by itself all the silver recovered from each separate charge, as ultimately all is saved, and there is no necessity for segregating the results of each operation. Indeed, to attempt to do so would be to entail much additional labor, resulting in insignificant advantages, as the system of dividing the responsibility and accountability serves as an effectual check upon loss or error from this source.

The copper ingots last about two weeks, the gradual wastage being made good by the addition of fresh quantities of copper. Each residual ingot averages eight ounces in weight. Thus the whole of the original charge of copper placed in a vat at any one time may be assumed (disregarding the fresh ingots added) to have been diminished in weight from 1000 to 25 pounds; and the average amount of copper converted into cupric sulphate being taken as 19 pounds 3 ounces for each ingot, the whole amount of copper of the original charge thus converted into sulphate is 975 pounds, or 97½ per cent. The residual copper, now in the form of small irregular nuggets, is washed upon removal from the vat to detach any adhering silver, and is sent to the ingot-melting room, to be used in alloying the mint-fine gold and silver to the standard coin fineness.

Sweetening the precipitated silver.—This operation is analogous to the method of purifying the parted gold, and consists in repeatedly washing with hot water the precipitated silver collected from the faces of the copper ingots. The mountain water from the mint service-pipes is very pure, and contains no chlorides. Were the latter present, they would necessitate a distillation of the water to prevent the formation of argentic chloride. There are four wooden filtering vats lined with sheet lead. The internal measurements are: Diameter at top, 28 inches; diameter at bottom, 24 inches; depth, 24 inches. The filters are of unbleached muslin sheeting. When old, they are burned, and the ashes are returned with the sweepings, etc., at the close of the fiscal year.

Disposition of the cupric sulphate solution.—As the precipitation of metallic silver upon the copper ingots proceeds, sulphate of copper is formed, replacing the sulphate of silver in the solution. After all the silver has been thrown down the solution of cupric sulphate is siphoned out from the precipitating vats and is drawn through leaden pipes into a lead-lined tank outside the building, whence it is removed by the contractors. It is used by the Lyon Mill and Mining Company at their works in Dayton in the amalgamation of tailings. The contract strength is 20° Baume, and the price paid in the census year was at the rate of 17 cents per pound for each pound of copper used in the mint refinery.

Prevention of loss of precious metal in the refinery.—The floor is covered with sheet lead throughout and is mopped several times every day. Whenever a portion of any solution is spilled it is at once wiped up. The mopcloths are finally burned and the ashes are returned with the general cleanup of the mint at the close of the fiscal year. All savings of this kind are credited, according to assay, to the melter and refiner in making up the annual accounts. The savings also include slags, sweepings, furnace ashes, flue dust, burned filters, old cupels, broken crucibles and stirrers, etc.

Manufacture of silver-cake.—The wet and loose silver, after sweetening, is squeezed into consistent shape by powerful hydraulic presses, and is then dried in a special furnace. Two of these presses are used. The pressure exerted is 40 tons to the whole area of the plunger face. The plunger is 12 inches in diameter, and the collar, which fits closely on the plunger, is 12 inches deep. The weight of a single pressed cake before drying is 1100 to 1200 ounces, and

its volume is about one-quarter of that of the unpressed charge.

Drying the pressed silver-cake.—One drying furnace is used. It is 34 inches wide, 13 inches high, and 8 feet long, and has a flat roof. The lining is of fire-brick, and the frames and doors are of cast iron. The grate area is 2 by 8 feet, and the grate-bars are 1 inch wide and five-eighths of an inch apart. The fuel used is yellow pine, in 4-foot sticks. The cakes are charged in pans, supported by six longitudinal bars, 1½ inches wide, with intervening spaces of 3½ inches. When completely dried, but not fused, the cakes are sent to the ingot-melting room and melted. The product is then known as mint-fine silver.

## The Ingot-melting Room.

This room is on the first floor at the rear, adjoining the rolling-room, and is 23 feet 1½ inches by 22 feet 8 inches in size. It belongs to the melter and refiner's department, and is in charge of a foreman, with three helpers. The length of shift is eight hours. The work done here is: *a*, Melting the silver-cake and the sweetened gold separately into mint-fine metal; *b*, preparation of standard coin alloy and remelting of clippings from the cutting-room; *c*, casting the alloy and the remelt into ingots; and *d*, cleaning the ingots and dressing them into shape.

In this room there are five furnaces, all alike. They have heavy cast-iron shells, lined with fire-brick, and are 16 by 16½ inches in area, 17½ inches deep in front, and 20 inches deep in rear, measured from the grate to the bottom of the flue. The flues are 6 by 8 inches, and lead to the main stack. The doors are of cast iron, steeply inclined toward the front. Lignite anthracite is used as fuel. The crucibles and stirrers are of graphite and clay mixed, the sizes of crucibles used being Nos. 45, 60 and 90. No. 12 Dixon crucibles are employed for dipping cups. The flux is borax and sometimes also niter, sal ammoniac, bone-ash and powdered charcoal. A melt of silver usually consists of from 5000 to 6000 ounces, but a melt of gold is smaller and is variable.

System of sampling mint-fine silver.—A cupful of about 200 ounces is taken from the top of the melt. Of this quantity all but five or six ounces is poured back into the crucible, and the remainder is cast into a small assay bar, stamped with the assay number of the melt and also numbered "1," to indicate that it is the top sample. When the large pot is nearly empty this process is repeated, and a second assay bar is obtained, which is stamped as before, but numbered "2," to denote that it is the bottom sample.

System of sampling mint-fine gold.—A similar method is practiced with gold, except that the assay bars cast are 10 ounces in weight.

Molds.—The molds are of clamped cast iron, and for gold, the series consists of one size each for double-eagle, eagle, half-eagle and quarter-eagle ingots. Quarter-eagles are not coined at this mint, though the necessary molds, dies, etc., are on hand. For silver ingots three sizes of molds are used; one for quarters, one for halves, and one for dimes and standard or trade dollars. The dollar mold produces ingots from which strips for punching a double row of dimes are rolled. The total stock embraced 135 ingot molds, as follows: Double-eagle, 6; eagle, 10; half-eagle, 10; quarter-eagle, 10; dollar and dime, 36; half-dollar, 36; quarter-dollar, 27. The duration of the molds is indefinite. They are said to become better as they grow older.

The ingots are cooled and cleaned by being plunged into a bath of cold water, slightly acidulated with sulphuric acid, in the proportion of 5 ounces of the commercial acid to 25 gallons of water.

Manufacture of standard gold ingots.—On the report of the assayer as to the fineness of the samples of mint-fine gold (which average 0.997 gold and 0.003 silver) the melter and refiner bases his computation as to the amount of copper required to reduce a given weight of mint-fine gold to the coin standard. The law prescribes that the proportion of copper shall not be less than 0.090. After placing into the crucible the proper amounts of gold and copper, clippings from the cutting-room may be added to complete the charge. The average weight of gold-ingot melts is 3000 ounces. In sampling the coin ingots a center chip is taken from the heads of the first and last ingots of the melt, and from the assays of these samples the assayer certifies to the alloy being of the proper proportions.

Manufacture of standard silver ingots.—The calculation for copper is similarly based on the assayer's report as to the fineness of the mint-fine silver. The proper amounts of silver and copper having been placed in the crucible, the charge may be filled out with clippings from standard silver strips, as in the case of the gold melts. The average weight of the silver-ingot melt is 1800 ounces. Granulations are taken from the top and bottom of each melt, the two samples together weighing about 0.30 ounce.

Legal tolerance.—The legal tolerance is the slight variation allowed by law from the absolute standard. For gold this margin is 0.0015 each way from the standard; that is, the coin may contain from 0.9985 to 0.9015 gold. For silver the allowance is 0.003 each way from the standard, or, in other words, the coin may legally vary from 0.997 to 0.903 in silver.

Actual working tolerance.—The mint regulations prescribe much greater accuracy than is required by the law. In mint practice the gold ingots are not allowed to vary more than 0.0005

\*From the census report on the "Statistics and Technology of the Precious Metals," by S. F. Emmons and G. F. Becker, special agents. The description of the mints and the processes applies to the year 1881, at which time the mints were examined.

from the standard, and the silver ingots are kept within a range of 0.0015. Thus the gold ingots actually only vary from 0.8995 to 0.9005, and the silver from 0.8985 to 0.9015 in fine metal.

**Liquation of silver in standard ingots.**—In cooling, there is a partial segregation of silver toward the center of the ingot, which results in making the center richer than the edges. It is found that the central portion of a rolled strip of standard silver prepared from such an ingot (the molecules during the rolling process maintaining the same relative positions to each other laterally that they had in the ingot) may sometimes be from 0.0005 to 0.001 finer than the edges of the same strip. This variation differs with the character of the strips; that is, for which sized coin they are intended. The planchettes are therefore slightly finer than the clippings, the greater bulk of the latter being from the edges of the strip, while the planchettes contain proportionally more of the central part. A slight allowance has sometimes been made to offset this irregularity. The alloy of gold and copper does not act in the same way, being more stable, and if there is a similar liquation it is in an imperceptible degree.

**Dressing the ingots.**—The ends of the ingots are squared by a clipping machine, the invention of the late John A. Eckfeld, of the San Francisco mint. This is a very compact and convenient machine, consisting of a vertically-sliding steel jaw in combination with a fixed steellower jaw, the driving machinery being inclosed in an upright frame or post. The ingots are then clamped in a vise and the rough edges dressed down by a 14-inch bastard file. After trimming, the ingots are sent to the rolling-room. The standard silver ingots weigh from 48 to 50 ounces each. The gold ingots for eagles weigh 69 ounces, and those for half-eagles, 44 ounces.

The floor of the ingot-melting room is covered by hexagonal cast-iron gratings, easily removable when the room is swept. Wherever practicable, as for pails, tongs, etc., the utensils here used are of copper. Iron discolors the silver ingots. A settlement of the standard ingots is made weekly. Bullion is received in the melter and refiner's department on the 1st and 15th of each month. All bullion is reweighed on receipt, in addition to the tally made by the melter and refiner or his assistant, when it is weighed out and delivered by the weigh clerk.

#### Coins of 1886.

There were 7,740,000 coins struck from the presses at the three United States mints last month, of which 152,000 were gold, 4,990,000 silver and 2,598,000 nickel. There were 3,000,000 standard dollars made, the largest for any month. The coinage for October and for the first ten months of the calendar year is as follows:

	For October.	Jan. 1 to Oct. 31.
Double eagles.....	\$ 360,000	\$ 1,290
Eagles.....	580,000	9,541,400
Half eagles.....	10,150	16,242,055
Three dollars.....	264	264
Quarter eagles.....	586	10,150
Dollars.....	3,000,000	26,173,625
Standard dollars.....	459	459
Half and quarter dollars.....	199,000	463,731
Dimes.....	33,100	42,423
Minor coins.....		
Totals.....	\$4,172,100	\$52,474,932
In 1885.....	5,252,908	44,936,750
In 1884.....	4,343,197	44,433,348

In 1885 the coinage embraced \$13,874,880 in double eagles, against \$17,511,600 in 1884. Only sample lots of this coin have been made this year. The coinage of standard dollars this year is nearly \$6,000,000 larger than in either of the previous two years.

**PENNIES.**—The Director of the U. S. mints states that the circulation of pennies in this country is confined to localities where odd change is exacted by way of street railway fares, etc., and especially by the extraordinary increase of late of shops whose policy it is to fix prices at odd amounts, that is to say, at prices not corresponding to the denominations of the Sub-treasury coin. The Director referred to the 99-cent store, so called. The Director is now endeavoring to ascertain the total active circulation of pennies and five-cent pieces, and considers that not less than \$7,000,000 of pennies are now in active circulation in the United States. The mint at Philadelphia is now turning out minor coin to the value of \$3000 a day, \$200,000 ahead of the supply. This amount will soon be made up and the public want will be fully met, despite its tendency to get into particular channels and to accumulate at public depositories. Orders for minor coins are filled in the order of application, but the Superintendent of the mint will probably be obliged to resort to the expedient of filling large orders in two instances.

**NEW ARMY HEADQUARTERS.**—Major-General Howard, commanding the Department of the Pacific, has taken up permanent headquarters in the Phelan building, on Market street, occupying the entire floor. He has selected rooms 201, 202 and 203 for himself and his secretary. The other rooms will be assigned to his staff officers and their clerks.

The acid works in Dayton, Lyon county, Nev., were destroyed by fire on the 11th inst. The loss was \$25,000; insured for \$8000. The property was owned by J. M. Douglass.

#### Tulare Lake.

This is by far the largest lake in California, measuring about 35 miles in width by 50 miles in length. Within a few years since its length was over 60 miles. Its western border is said to be a comparatively trackless desert, a few isolated ranches comprising all the settlements. The traveler who passes along that way must provide himself with water and food for himself and animals over long stretches of hot, dry and dusty country. And yet, when water is provided for irrigation, no doubt the land can be made a garden spot. It is not far from the northern border of this immense lake that we find the rich agricultural lands of Mussel slough, embracing Hanford and other enterprising settlements. The name Mussel slough is derived from a stream that empties into Tulare lake containing great quantities of fresh-water mussels.

The north, east and south shores of the lake recede very gradually to the lake, and for miles out a boat can be propelled by pushing with poles touching the bottom. On the west side the shore is more abrupt.

Abundant flowing artesian wells are obtained at a depth of about 400 feet on the eastern and northeastern and southeastern borders.

At the mouth of Tule river, 13 miles west from Tipton (on the S. P. R. R.), is kept a small steamer capable of conveying about a dozen individuals. It is used by hunters who have a camp at that point. Trips are made once a week or so across the lake. At some seasons of the year large quantities of game are secured for the S. F. market—principally ducks, geese and terrapin. A handsome species of large white swan inhabit the lake winters, going north summers. Big pelicans are often seen. Grebe, a smart and quaint-looking diving bird, larger than ordinary ducks, are increasing in numbers. The fine, soft and pure white down of their breasts and bodies, except the upper portions, makes their skins highly prized by many ladies for warm capes and ornamental dress trimmings. Snipe, as well as some other varieties of game, are found in greater or less quantities.

Probably no other one place in the United States affords as many rare and easily-obtained luxuries for four-footed swine as the borders of Tulare lake.

In the spring of the year good-sized fish—locally called mullet—force their way in among the tule reeds in immense quantities. Like catfish, they have large heads. This makes locomotion difficult in the tules, and they fall in legions an easy prey to the swine.

The aboriginal tule hog is pictured in the minds of the oldest inhabitants as being from 6 to 10 feet long and 4 feet or more in height, with legs slim and fleet enough to create a desire on the part of ordinary two-legged animals to give them plenty of distance. By cross-breeding with modern breeds of swine, the wild hogs have become improved and less ferocious. They have also imparted their fishing proclivities to the domestic animal, and he can now swim for fish, and dive and dig for mussels along the shores of Tulare lake, as expertly as his ancient porcine predecessors. Thus, with fishing, fresh clam excavating and digging a very nutritious species of nuts which grow on the roots of a peculiar species of a reedy-like grass, which grows abundantly in places along the shore, the Tulare lake porker easily gathers unto himself a daily feast unequaled by his swinely brethren of any other hunting ground.

It is said to be in contemplation to put on a steam ferry-boat next summer to make regular trips across the lake.

Notwithstanding its alkaline qualities, this is a beautiful and grand body of water. From the fact that a few hunters and cattlemen are the only human beings who have occasion to sail upon its immense bosom, or even look upon its great and usually placid face (except from long distances), but little is said about it in public print or otherwise. At this season of the year, at least, the water is not so unpalatable as the writer had supposed it to be from hearsay.

During the past 20 years the borders of the lake have greatly receded, leaving a large amount of the richest tillage land to be found in our State. Yet there was a time, since 1849, when Tulare lake contained much less water than at present. This is evidenced by old barns and corrals now standing in shallow water a long distance from the water's edge.

The slope on the east side to the lake is not much, if any, greater than one foot per mile, so that its tule border prevents those living near from viewing its surface without rising to an elevation or visiting its very shore. Probably not one citizen in twenty, of Tulare county, has ever visited or enjoyed a near view of this remarkable inland body of American waters.

It seems to us that Tulare lake merits more attention than it receives. It lies quite near Tulare City, which promises to be a metropolis of the upper San Joaquin, and in a county which this year is the banner grain county of the State. It should receive the attention of the scientific explorer, for it must contain a wealth of animal and vegetable life which is new to science, and perchance minerals of great interest and importance. Navigation of the waters of the lake may add much to the information we have about the west shore, and it is not unlikely that there may be found many places worthy of settlement in this compara-

tively unknown land, which includes both the immediate borders of the lake and the foothills of the Coast Range beyond. We predict that an exploration of this region may disclose such resources in soil and mineral that the wonder will be that they could have remained unknown so long.

#### A Shaft Full of Water Tapped.

The Deadwood Mining Company have been engaged for some time in extending their tunnel so as to connect with the incline which is filled with water, the pumps having been stopped some five or six years ago. The tunnel is about 200 feet below the surface of the incline. As J. J. Lyons, the superintendent, recently found it was nearing the incline, he took great precaution to prevent any accident occurring by the water leaking in upon the workmen. On Friday, while Mr. Lyons was at the head of the tunnel breasting out some quartz, he was called by William Harrison, who was working about 40 feet away from him, to come quick and help him put some boards in the side of the tunnel, as the dirt was caving and a stream of water was pouring in. Mr. Lyons hurried to the spot, took in the situation, and said: "Let's get out of here as soon as possible." They had over 1000 feet of tunnel to traverse before getting out, and in their hurry their candles went out and they had to grope their way in darkness. They managed to get out safely, except receiving numberless bumps from the timbers overhead. They met the carman just coming into the tunnel for a load of quartz, and to him they shouted: "Get out as quick as you can." He immediately threw himself on the other side of the car and pushed it out, Lyons and Harrison following. The car was pulled up on the bank and everything made safe in short order, but none too soon. In a minute or two at least 10,000 inches of water came rushing through the tunnel with a pressure of 200 feet. It was discharged into Deer creek. An examination of the tunnel on Saturday showed that no damage, whatever, had been done to the timbers, it having stood the test admirably. The company will now be able to work a chute of ore that runs in proximity to the incline and which paid the company excellent returns in years gone by. The pump, which has been submerged for several years, will also be started up, and an effort will be made to put the mine on a paying basis.—*Nevada City Transcript.*

**A PLACER MINE DISPUTE.**—The Supreme Court has confirmed the judgment of the Superior Court in the case of McLaughlin vs. Del Re et al., by which the defendant was awarded \$470 damages, and an injunction granted restraining the plaintiff from trespassing on a certain placer mining claim in Old Gulch, Calaveras county. It appears from the findings that defendant had a claim on the hillside at Old Gulch and used the hydraulic mining process. He had worked this claim since 1864, and had deposited the "tailings" and debris in a certain place during that time. In 1868, plaintiff took up a claim on the land used by defendant for the debris, and had constructed a flume and ditch to convey the water necessary to mining. The debris, however, continued to come from the defendant's claim above, and destroyed plaintiff's ditch and flume. The court was of an opinion that the evidence, though conflicting, warranted the findings. Hence the judgment.

**BAYHORSE, IDAHO.**—C. P. Mason and B. B. Van Deusen, of Salt Lake, are in Bayhorse, Idaho, arranging for putting in a concentrator at the smelting works there for concentrating the Beardsley and other ores. The machinery is furnished by the Utah & Montana Company, Salt Lake, and will be shipped from that city early next week. The capacity will be from 50 to 75 tons of ore per day, and will be ready for use by December 1st, if the weather is favorable. The same company is also furnishing a Huron wire-rope tramway between the Beardsley mine and the concentrator, the length of which will be some 3500 or 4000 feet. This tramway is also to be erected at once. This looks as if the Bayhorse will be soon put in active operation after the long spell of idleness pending the Beardsley-Excelsior litigation, and better times may be looked for in that old and reliable camp.—*Idaho Statesman.*

**SCHOOL OF MECHANICAL ARTS.**—The California School of Mechanical Arts was endowed by the late James Lick with \$540,000. The object of the fund was to educate males and females in the practical arts of life, such as working in wood, stone, iron or other metals. The trustees are: Horace Davis, A. S. Hallidie, John O. Earl, John H. Boalt and William Ashburner. A conference will soon be held with President Holden, of the State University, Prof. Rising and others in regard to the best means of starting the school. The trustees have been in communication with instructors of technical schools in the East, and have received considerable information.

The San Francisco ironmolders have adopted resolutions opposing working on Sundays and legal holidays unless double pay is received. A copy of the resolutions will be sent to the proprietors of the various foundries.

#### Cinnabar in New Mexico.

The Socorro (N. M.) *Bullion* says: The reported discovery of cinnabar in this county, which was announced in last week's *Bullion*, has had the effect of producing no inconsiderable stir among mining men. This is, however, not the first time that such an agitation has been caused in this vicinity. In 1880, as we stated in a previous issue, cinnabar was found in inconsiderable quantities on the Alamillo grant. The same character of mineral was found by John Smythe the years previous to this if our memory is not treacherous, in the vicinity of Bear mountain. But the earliest mention of that mineral in this county is that in which a sheep-herder who lived in Sabinal, while grazing his flock on the Ladrones, after a hard rain, many years ago, found metallic mercury in the bottom of a spring on the slope of that range, which had been uncovered by a cloudburst which occurred in that vicinity. The bright liquid metal was a new element to the unsophisticated herder, and in wonder he left his flock in charge of Providence and took the trail without loss of time for his home. Upon his arrival, a hasty organization was formed, which, led by the discoverer, departed for the spring in which the quicksilver was discovered. But upon reaching the scene, there having fallen in the meantime unusually heavy rains, the spring had forever been closed from sight by debris, and the topography had been so much altered that the guide, after several days' search, utterly failed to find the spot which concealed the treasure which was to make him and his companions forever rich.

Prof. Sanders informed J. D. Woodyard and the writer last year that in Water canyon he had discovered on several of the claims there gold and silver in amalgam with mercury; and traditions are current that this metal was seen on the east side of the Rio Grande in this county by the earliest Spanish adventurers who settled in this section of New Mexico.

We are not at present in a position to declare ourselves as to the importance of the reported discoveries, but will use an effort to furnish our readers an impartial statement as soon as our examination of the situation has terminated. There are parties already in Socorro prepared to take hold of the property and erect a plant for the treatment of its production, in case the discovery is corroborated and found to be of sufficient extent to warrant the investment of capital.

**HOPES OF A PROSPECTOR.**—The sanguineness of prospectors is simply remarkable. Their hopes are always high, and the possibility of non-success is seldom thought of. This is well illustrated in the case of an old prospector who lives near Sierra City. He is commonly called Martine. Martine came to Sierra City in the early fifties, and has ever since devoted his time to prospecting. His efforts in the way of finding valuable ledges have been attended with more than ordinary success, he having discovered the celebrated Keystone and Phoenix mines. But, like the inventor, who rarely reaps the reward of his invention, so it is with the prospector; his valuable find falls into other hands, and he finds himself in no better financial condition than before. Martine's success in finding good ledges for other people to wax rich and fat on has encouraged him to devote 20 long years of his life in seeking for some rich ledge that is supposed to exist near the Kirby sawmill about three miles from Sierra City. Martine is satisfied that the ledge is there, and his repeated failures to find it in no way discourage him. We hope he will succeed. He being, however 65 years old, the chances are against him, unless he obtains from the Lord an additional 20 years' lease of life.—*Sierra Tribune.*

**WORKING TAILINGS IN IDAHO.**—General Winters has started the work of erecting a concentrator to work the tailings from Camas No. 2 mine, in Wood river. There are probably 4000 tons of tailings at the mine, which carry from \$10 to \$75 per ton. The concentrator will be erected on Camp creek, about a mile from the mine. The works will be the most primitive known, and consist simply of any desired number of flat sluices about 18 inches wide and 100 or more feet long. These sluices will be covered with gunny sacks, which will catch all the heavier particles of stuff, which contain precious metals; and by sweeping these off every half-hour or so the "concentrates" will be swept into a box, whence they can be shoveled and hauled to a market in Hailey. The cost of hauling to Camp creek and concentrating Gen. Winters thinks will not exceed \$1.25 per ton.—*Idaho Statesman.*

**INSTANTANEOUS PHOTOGRAPHS.**—Instantaneous photographs of the hearts and intestines of various animals have enabled Dr. W. G. Thompson to determine the action of the organs more clearly and accurately than is possible by other methods. Such photographs may prove of great value in showing changes effected by drugs, as well as in their physiological teachings.

**SILVER GOES UP STEADILY.** There's no use disguising the fact that prosperity is once more getting its grip on the country, for all of which we are truly thankful.

#### Passing Events.

The closing down of the great Anaconda copper mine, Montana, this week is connected with the wages question, the company desiring the men at the smelter to accept \$2.50 instead of \$3.00 per day. A large number of men are thrown out of employment. The mine will not start up until next May.

There have been a great many mining accidents lately, most of them caused by caves in mines or by carelessness in blasting.

The excitement in mining stocks in this city is on the increase, and is more intense than any that has occurred since bonanza times. The increase in value of shares has been very large within the past month.

The price of silver has gone up above the \$1 mark and silver miners are greatly encouraged thereat. Some mines that expected to close down have taken a new lease of life.

Mining operations in this State are in a flourishing condition generally. We have here the benefit of a mild climate in winter, so that operations in most parts of the State are carried on all the year round.

The reported stopping of mining operations at Cusihiuriacheo, the big mining camp in Chihuahua, turns out, on the part of the American company at least, to be only temporary. It was caused more by the lack of fuel than anything else. This has been remedied now, and operations will be resumed at once.

#### Boosting the Mining-Share Market.

Once more, and for the first time in a number of years, the mining-share market of San Francisco has gotten into one of its old-time tantrums. Though a mere flurry compared with the whirlwind of excitement that in former days swept over the community, the movement in shares has for a week or two past been decidedly breezy. This improvised market has not, to be sure, been attended with very heavy sales or extremely high prices; nevertheless, it has for a month or more past been quite active and still so remains, transactions having been confined mostly to Comstock shares. Having been preceded by no great strike in the mines, this stir in stocks came upon the community unawares. But this is the way these speculative cyclones frequently occur, there being no signal service to foretell their advent. They very often burst upon us from a clear sky, coming suddenly and when they are least expected. Though making their appearance so unannounced, they have not for this reason proved the less mischievously effective.

Having been intermitted so long, those not directly interested had begun to hope that the last of these pernicious stock excitements had been seen. But in this it looks now as if this hope were doomed to disappointment. It looks as if these insane movements were destined to a periodical return, the most that we can hope for being that we shall, as in this last interregnum, have gracious respite from their any more frequent occurrence hereafter. Looking back to the inception of stock gambling on this coast, it is seen that these speculative movements have at irregular intervals made their appearance, coming often, as in this instance, without premonition or reason. Such being the case, we despair of any relief from this evil, the more especially as certain parties seem able to get up one of these stock deals whenever their selfish instincts may prompt them to do so.

As already intimated, this recent appreciation in the price of mining shares has not been due to any new or important ore find. That such is the case must be obvious to all, inasmuch as little or no exploratory work has been prosecuted of late in the upper and only fruitful zone on the Comstock lode. All the ground situated above what was long since demonstrated to be almost wholly barren territory, was extensively and thoroughly exploited years ago, this work having been done so effectually as to preclude the possible existence there of any considerable quantities of ore, other than such as was then developed. All the high-grade ore found at that time was taken out and milled, that of poorer quality having alone been left behind. While there is, beyond any question, some excellent ore now being raised from the Consolidated California and Virginia mine, the quantity will not probably prove to be large; unless to be sure, it was left there through design, since, with the prospecting work done in all the upper levels of that mine, it could hardly have been missed, or accidentally overlooked. The upper sections of the great ore channel have not, we admit, been gone over with a fine-toothed comb; but they have been pretty well hackled by other and equally efficacious methods. The whole lode has, in fact, been chambered from top to bottom with drifts, tunnels, crosscuts and winzes, from which, again, borings with machine drills have been extended for thousands of feet, and in every direction. Pierced so through and through, how any large or even considerable bodies of rich ore could have escaped detection, supposing any such bodies to exist, passes comprehension.

As stated in an article on the subject, published not long since in the columns of this paper, there remains still in the upper portions of these Comstock mines a great deal of low-grade ore, the most of which can be extracted and milled with a fair margin of profit. But that there exists there any more bonanzas is more than problematic, as they who hold to a contrary opinion will, if they proceed to act on the same, be very likely to find to their grief.

During the earlier history of the Comstock mines, when the uncovering of a bonanza was a thing that might almost any day be looked for, the occurrence of a furor like that which is now running its course was an event that might be winked at, if not wholly pardoned. But that a craze of this kind should now be suffered to obtain is so without reason or excuse that its

originators, aiders and abettors may justly be held amenable to public condemnation. That this craze will prove to be short-lived and work less injury than has attended most of its predecessors is a consummation earnestly to be wished and devoutly prayed for.

#### California Chemical Products.

In looking over the statistics of the manufacture of chemical products and salt, we find that California, for a comparatively new region, stands very fairly. There are in California 42 establishments devoted to manufacture of chemical products, a percentage of 3.11 as compared with the total in the United States. The total value of products is \$3,179,700, or 2.71 percentage of total value in the United States.

In the distribution of manufactures of special products, with approximate value of each, compared with the total value, California stands as follows: In nitro-glycerine manufacture, California stands No. 1, with an approximate percentage value of product of 36; in glycerine-making, we stand No. 3, percentage 4; stearic acid candles, No. 2, percentage, 16; oleic acid soap, No. 5, percentage, 6; sulphuric acid, No. 8, percentage, 3; castor oil, 4, percentage, 6; white lead, No. 8, percentage, 4; other salts of lead, No. 4, percentage, 9.

Out of 1349 establishments of the character being considered in the United States, California has 42. Value of buildings, \$388,300; value of machinery, \$409,725; capital invested, \$2,406,350; wages for year, \$282,214; employees, 573; value of materials, \$49,000. Among the chemical products enumerated are the following: Borax, 1,422,443 pounds production; value, \$107,333. Castor oil, 50,000 gallons; value, \$45,000. Stearic acid candles, 2,596,000 pounds; value, \$375,000. Oleic acid soap, 2,135,000 pounds; value, \$44,300. Other hard soaps, 8,927,500 pounds; value, \$429,860. Glycerine, 394,800 pounds; value, \$38,736. Nitro-glycerine, 1,242,424 pounds; value, \$655,680. Manufactured manures, 1000 tons; value, \$200,000. White lead, 4,000,000 pounds; value, \$260,000. Other salts of lead, 100,000 pounds; value, \$60,000. Sulphuric acid, 5,105,995 pounds; value, \$129,195. Value of all other products, \$959,596; total value of all products, \$3,179,700. As might be supposed, San Francisco is the center of manufacture of the State.

#### Personal.

Mr. D. Ernest Mellis has left this city for Mexico, not for New York, as was stated last week.

John Hays Hammond, the mining engineer formerly residing here, but latterly in New York, is on a business trip to San Francisco.

Mr. C. H. Aaron, the assayer, is at Nogales, Arizona. He writes us that so far he sees no special improvement in business since the capture of Geronimo, who had been greatly blamed because it was not so good as it might have been.

Mr. F. G. Corning, a prominent mining engineer of New York, is visiting this State looking at the mines. He was up at Grass Valley last week, but has returned to this city and called at the editorial rooms of the Press on Thursday.

G. de la Breylise, of Paris, the celebrated French mining engineer, is at the Palace hotel. His name is connected with several noted feats of civil engineering on both sides of the Atlantic, but he is specially known in America for some achievements in mining enterprises with which he has been connected.

George Tew, of Sombereite, State of Zacatecas, Mexico, is in town on a visit. He is largely interested in mines there. Mr. Tew is well known in California as a prospector and miner, having visited all parts of the coast in former times. Of late years he has been in the mining districts of the Sierra Madre, Mexico.

Mr. K. Yamada, mining engineer of the Imperial Mining Bureau of Ikuno, Japan, has been visiting the Comstock and other Nevada mining districts. He has now gone to Utah, and from there will visit Colorado, after which he will return to San Francisco, and thence to Japan. He is gathering information about mines and reduction works.

The Giant Powder Company's dividend this month is the first by that corporation since

June, 1884. Up to that time, however, it had paid regularly every month for 13 years.

#### Gold and Silver Mills.

The processes of working gold and silver ores vary more or less with the character of the ore, but where they are "free-milling"—do not require roasting or previous preparation—the process is very much the same all over the coast. To those not familiar with the process of milling gold ore or silver ore the following brief description will be of interest:

In gold mills the ore coming from the mine is dumped upon the grizzly, where it is screened; that portion which is less than a two-inch cube passes directly into the ore bin; that portion which is larger is fed into the crusher and passes into the ore bin, from which it passes by gravity into the hoppers of the ore-feeders and is fed automatically into the mortars, as required.

The size of screen generally used on the mortar is a 40-mesh or a No. 9 to 10 slot punched screen. The ore after passing through the screen falls directly upon the plates; if the ore contains free gold only it is allowed to run to waste as tailings, but if the ore contains sulphurets it is conducted from the plates to concentrators, when the sulphurets are taken out. The style of mortar generally used is of single discharge, with copper plate in the back, which can be removed for cleaning. Each mortar (5 stamps) weighs about 5000 pounds. The stamps weigh about 750 to 800 pounds, and are usually run at about 90 drops per minute.

In silver mills ore from the mine is dumped upon the grizzly, which screens that portion small enough to go into the mortars; the balance is passed through the crusher, which falls into the ore bins, from which it passes by gravity into the hoppers of the feeders, from whence it is fed automatically into the batteries. These mortars are generally single discharge and are provided with a 40-mesh steel wire or brass screen, or a No. 9 or 10 slot-punched Russia iron screen. The ore, after coming from the batteries, is conducted into settling tanks, from which it is shoveled into the pans. Quicksilver is introduced (200 pounds to the pan) and the process of amalgamation goes on. After remaining in the pans for from five to eight hours (according to the character of the ore) it is drawn off into the settlers, when by gentle agitation the amalgam and quicksilver is settled, and drawn off into canvas straining sacks; the amalgam remaining in the sack while the quicksilver passes to a tank, from which it is elevated to the pan floor to be used again in the same manner as before.

The amalgam is taken from the sacks or safes and placed in retorts, where, after being heated for from five to six hours, all the quicksilver it contains has been driven off and condensed for use again. The retort is then allowed to cool, when it is opened and the silver taken out, which is in the form of a porous, spongy mass, usually called by millmen crude bullion. This is broken up and placed in black-lead crucibles and melted, with borax and other fluxes to collect the impurities contained, and cast into ingots or "bricks" weighing about 1200 ounces Troy. It is then ready for market, being usually about 990 to 997 fine.

If the ore contains gold it will be found in the brick with the silver.

This process, if proper care is taken in manipulation, will save 95 per cent of assay value; great care should be taken to keep the quicksilver in proper condition; it should be kept perfectly clean in order to utilize its full amalgamating properties and prevent flouring. Flouring is a term used by millmen, and signifies that the quicksilver has segregated or divided itself into myriads of small particles, so fine that they may be held in suspension in almost still water. When quicksilver is in this condition, great loss occurs, not only in quicksilver itself, but in silver, as each particle contains more or less. In mills where the greatest care and attention is bestowed the loss in quicksilver from various causes is considerable, generally from three-fourths to one pound, per ton of ore worked. This, however, has been reduced of late, by allowing the tailings to run into one or more Duncan concentrators, or a machine equally as effective, when a large percentage of quicksilver and amalgam escaping the settlers is caught, as well as the sulphurets, if any are contained in the ore.

## Fox's Corrugated Furnace Flues.

The application of corrugated surface to the furnaces of marine boilers, within the last few years, has marked a distinct advance in this branch of steam engineering. The advantages in economy and efficiency accruing from the use of these greatly strengthened tubes in marine practice are attracting now the notice of steam users generally, and their application to land boilers is steadily increasing. It is only a few years since the Fox corrugated furnace and flue were first brought to notice. Yet there are now over 10,000 furnaces of the Fox construction applied to boilers in all forms. By these means pressures are used varying from 100 to 180 pounds, with furnaces only 3-8 to 9-16 inch thick, and as large as 4 feet 8 inches in internal diameter. This was heretofore quite impracticable.

The engraving given herewith will show the form of the flue. The advantages of the corrugated furnaces will appear from the following statement: They possess, as compared with the plane flue, greatly increased strength to resist collapse, the ratio being 4½ to 1 in favor of the former. The results of a series of tests of this factor, made in the presence of representatives of the English Admiralty, the Board of Trade and Lloyd's Register, indicated the average strength of the corrugated furnace to resist collapse to be four times greater than the plane flue of the same dimensions.

In one experiment with two flues, each 3 feet 2 inches in diameter and 7 feet 4 inches long, both of ¾-inch plate, having sound welded joints, and perfect in every way as to material and workmanship, the plane flue totally collapsed at 225 pounds per square inch pressure, while the corrugated flue stood 1026 pounds per square inch before collapse set in. This series of trials proved that, even when flattened to the extent of 15 inches on both sides, the corrugated furnace will bear 450 pounds per square inch before moving on further to collapse.

From this important fact there results several notable consequences in respect to the construction of boiler furnaces, as will appear from the following: The great strength of the corrugated surface permits of an increase in the diameter of corrugated furnaces without corresponding increase of thickness of plate. At present they are being made of ¾-inch plate, 4 feet 8 inches outside diameter, to carry 135 pounds pressure per square inch, and constructed of one single plate, the welding being so disposed as to be below the fire-bars. The practicability of employing comparatively thin plates for boiler furnaces by the use of the corrugated surface, the absence of joints in contact with the flame, and the employment of the unusually high pressures which this form of furnace construction permits, are factors which point to a notable economy, and practice has demonstrated the truth of this presumption, both in respect to a considerable diminution in the consumption of fuel to indicate a given horse-power, and, in the case of marine practice, in the ability to develop the required power with fewer boilers, which means a reduction in the number of stokers required and an increase of available space for freight, or longer voyage for the tonnage of fuel consumed.

A series of official trial tests of the evaporative power of various types of boilers, which

were made lately, is said to have developed the fact that those fitted with the Fox corrugated furnace showed first on the list, having evaporated the greatest quantity of water per pound of fuel consumed, and having evaporated the greatest quantity per square foot of heating surface. That such efficiency should be obtained appears quite reasonable when it is considered that, without increasing the size of the furnace and flues, the corrugated surface affords an increase of 50 per cent in the heating surface which it exposes to the furnace gases, over plane flues of the same dimensions; while the corrugated form, likewise, insures a more prolonged contact and a more perfect absorption of the heat of the furnace gases than it is possible to obtain with plane flues.

Another advantage claimed for the corrugated form of furnace is, that while affording a powerful longitudinal tie to the boiler, it possesses great elasticity, and is free to expand and contract in obedience to variations of temperature, without bringing any extra strain upon the ends of the boiler to which it is attached. An incidental advantage growing out of this expansion and contraction is that it operates effectually to loosen and dislodge the scale and sediment which may be deposited on the flues.

The annexed table exhibits the comparative performance of the boiler and engine of several

THE FOX CORRUGATED BOILER FLUE.

steam vessels, of equal tonnage and dimensions. The marked superiority of performance in the case of those fitted with the triple expansion engines and corrugated furnaces over those having compound engines and plane furnaces, will be noticed. The results are obtained from average voyages at sea.

The Fox corrugated furnaces are used by the leading ship-builders of Great Britain and the United States. Among the principal users of the invention we may name the following: Canard, Anchor, Guion, National, Atlas, Great Western, French Transatlantic, North German Lloyds, Peninsular and Oriental (P. and O. Line), State and Dominion lines, John Elder & Co., J. & G. Thompson, of Glasgow; Oswald Mordant & Co., of Southampton, England; Grand Trunk Railroad, Levis Maritime and Industrial Co., and Watrous Engine Works, Canada; Pacific Mail Steamship Co., John Roach, Wm. Cramp & Sons, Harlan & Hollingsworth Co., N. Y. Safety Steam Power Co., Burland, Brown & Co., I. P. Morris Co., Edgemoor Iron Co., and Risdon Iron Works, Cal., in the United States, and hundreds of others in all parts of the world.

These furnaces are manufactured by the

Leeds Forge Co., of England, under the personal supervision of Samson Fox, the inventor and patentee. The sole agents for the Pacific Coast are the Risdon Iron Works, of San Francisco.

## Lead Mining in Nevada.

During the past year the Eureka Consolidated mine, at Eureka, Nevada, has been worked almost entirely by tributaries. No new ore bodies have been found, and it is not thought that the chances of finding any above the 930-foot level will warrant spending any money in prospecting there. The hydraulic pumping machinery at the new shaft is all in running order, and the new hoisting engine is of sufficient capacity to work the mine to a depth of 3000 feet. A refinery and other improvements have been added to the furnaces for the purpose of reworking the rich slags, etc., accumulated at the furnaces, with the low-grade ores from the mine, large quantities of which may be obtained at little cost. It is thought the new improvements will enable the company to again place itself on the list of dividend-paying mines.

In the company's "receipts" for last year were 18,399 bars, equal to 995 tons, valued at \$313,334; from assessments (3), \$150,000. The

total receipts were \$523,135.

The principal items of disbursement on mine account were: \$30,142 on tribute ore (4120 tons); \$10,136 payroll; \$6459 prospecting labor; the total on mine account being \$61,439.

On a new shaft account, \$51,538—the new hoisting engine cost \$16,000, and \$3764 for freight; labor payroll, \$14,336.

The smelting account aggregates \$231,610. The principal items are: Payroll, \$29,590; charcoal (235,696 bushels), \$54,072; purchased ore (3590 tons), \$124,164.

The improvement account amounts to \$31,260, of which the payroll is \$6858; building material, \$7003; water jacket and castings, \$4598, and the payroll in refinery, \$5980. The speiss experiments cost the company \$5233.

In the refinery account the only large items are \$10,200 for salaries, \$25,290 for refining 18,399 bars base bullion, and freight on this, \$28,299.

The company has now resources of \$98,050, against which are liabilities of \$55,823, leaving \$42,227 net resources. The total receipts and disbursements aggregated \$523,135 for the past year.

## The Iron Mountain Fiasco and Its Effects.

About one year ago certain capitalists, residents of San Francisco, began negotiations for the Lost Confidence, better known as the Iron Mountain mine, situate in Shasta county. In due time these negotiations led to the purchase of that property for the sum of \$125,000, \$50,000 cash and the rest payable out of the net earnings of the mine. This accomplished, the new owners proceeded at once to put up a 20-stamp mill on the mine, the entire transaction, both the purchase and the equipment of the property, having been undertaken and conducted throughout at the instance and under the personal superintendence of a man claiming to be conversant with the whole business, and in whose experience, judgment and integrity these parties reposed such confidence that they followed his advice explicitly throughout, consulting no other mining expert or metallurgist in the premises. This was not a wise thing to do, as the outcome of this venture tends to establish.

But, as remarked, a mill was put up, after which ore-crushing commenced; and now, for the first time, it becomes apparent that this Iron Mountain ore cannot be reduced by simple mill process. It is found to carry too little lead for smelting and too much antimony and other base stuff for treatment without roasting; which latter method would, no doubt, have been adopted, had it not about the same time become apparent that this ore was of too low grade to warrant its beneficiation by such costly process. This having been determined to the satisfaction of the parties investing, they concluded to abandon the enterprise, whereupon the entire property, mill included, was disposed of for less than a tithe of what it had cost them, their total loss having amounted to more than a hundred thousand dollars.

But the loss sustained by these worthy and enterprising gentlemen, though severe and much to be deplored, is trivial, compared with the damage this Iron Mountain fiasco has inflicted upon Shasta county, and to some extent on the entire mining industry of the State.

From this deplorable event one or two useful lessons may be gleaned: First, that it is extremely dangerous for those about to undertake costly mining investments to rely solely on the advice and opinions of any one man, even though he enjoy a reputation based on a long and successful experience. To rely on a person of limited practice or mediocre ability is, in such case, altogether perilous, as the parties in question have found to their cost. Again, \$125,000 is too much money to pay for a mine so little proved as this on Iron Mountain appears to have been. Then, to put up a costly mill without some considerable ore developments made, is always a mistake, while to put up reduction works of any kind without having first determined that they are adapted for the work to be done, is worse than a mistake, since there can be no possible excuse for it. It is a matter for astonishment that, with these fatal blunders repeated year after year, they should still be of such frequent occurrence! Seeing them so repeated over and over one is led to query, will there ever come an end to them—will ever either the miner or the investor learn what to most people seems so obviously the dictate of common sense?

PROFESSOR RISING, the State Analyst, will read a short paper on "A State Bureau of Chemistry—Its Relation to Manufacturing and Producing Interests," at the annual meeting of the Manufacturers' Association, next Monday night, at the Mechanics' Institute building, on Post street. The association intends having brief special discourses at its sessions hereafter.

ACADEMY OF SCIENCES.—At the last meeting of the Academy of Sciences, Prof. E. S. Holden, of the University of California, read a paper "On the Distribution of Stars in Space," which we shall publish in the Press shortly. Prof. Davidson read a paper descriptive of the recent occultation of Aldebaran.

DIVIDENDS.—The mining companies paid \$160,500 in dividends in this city in October, as follows: Homestake, 40 cents, or \$50,000; Jackson, 10 cents, or \$5000; Martin White, 25 cents, or \$5500; Ontario, 50 cents, or \$75,000; Plymouth Con., 25 cents, or \$25,000.

COMPARATIVE RESULTS OF TRIPLE EXPANSION ENGINES AND FOX'S PATENT CORRUGATED FURNACES vs. COMPOUND ENGINES AND PLANE FURNACES.

Builders.	Name of Steamer.	Tonnage.		Dimensions.			Triple Expansion Engines. Boilers fitted with Fox's Corrugated Furnaces.	Compound Engines, Plane Furnaces.	Average knots per hour. ## MECHANICAL PROGRESS.

## Important Invention in Copper Gas Tubing.

The English correspondent of the *American Manufacturer* refers to what appears to be an important improvement in the manufacture of gas tubing, as follows: A new invention which, if heartily taken up, seems likely to prove of considerable value in the gas-tube trade, has just been developed by Mr. Thomas Budworth Sharp, the manager of Numby's Metal Company, Birmingham. His new discovery is the manufacture of small gas tubing in coils of an indefinite length out of copper, intended to supersede the ordinary composition piping used in the gas-fitting trade, and as also made and sold in coils. The sizes in which the new manufacture is produced up to the present are in tubes of one-fourth, three-eighths and one-half inch.

## The Question of Cost.

The practical question which at once arises upon the face of the invention is: How can copper take the place of composition when the former is from three to four times as costly as the latter? The inventor has an easy answer. As a tube of equal or even greater strength can be made with only one-third to one-fourth the weight of metal in it for any given length of tube, the weight per foot is inversely proportionate to the price per pound, and the price per foot becomes the same. Seamless copper tubes are made in lengths of hundreds of feet. Mr. Sharp makes these long tubes without even a suspicion of a joint of any sort, dead uniform throughout, equally smooth in and out, and in lengths of hundreds of feet. The samples of the new manufacture which are now on exhibition in Birmingham give promise of every success.

## The Mechanical Methods Employed in the New Process.

Mr. Sharp dispenses with the cylindrical mandril and bulbed rod employed in the ordinary method of producing copper tube, and employs instead a loose plug. The fore part of this plug is of the diameter which it is intended the interior of the tube shall have after the drawing process, while the rear part of the plug is of larger diameter. The fore end of the tube to be drawn down is reduced in the ordinary way, so that it will pass through the drawing hole; the plug is then introduced into the tube, its smallest end foremost. The plug having been pushed up to the draw place, the tube is drawn in the ordinary way through the drawing hole. The plug stations itself by the motion of the tube at the "eye" of the draw plate. The small diameter of the drawing hole, between which and the rear of the plug the tube under operation is situated, prevents the advance of the plug; and between the plug and the drawing hole, the reduction of the external and internal diameters of the tube, as well as the reduction of the thickness of the metal of the tube, takes place. This process gives very cheap results, but in order to cheapen it still more for tubes of small diameter, the inventor dispenses with the mandril and uses in its stead two drums, from one of which the tube is coiled on to the other, with the reducing tools fixed between them.

**MULTIPLE MOTORS.**—The old maxim that "there is economy in aggregation" may, like most other maxims, meet with some exceptions when put into practice. The power necessary to drive the machinery of a large mill can of course be developed more economically in one large engine than it could in a number of small ones. The first cost will be less, the performance more economical, the cost for attendance and repairs lower, and everything seems to point to the desirability of such a system. Yet is there not a point where the increased cost of putting up, maintaining and running long lines of shafting to convey this power to distant points, the expense attending the running of shafting for the whole establishment when only a portion of the machinery is run, the enormous expense of running a single department overtime, and the liability of stoppage to the whole of the works through accident to one machine, more than equals all the economical advantage derived from the concentrated motor? On a recent visit to a large manufacturing establishment constructed upon the most modern principles, we noticed that one of the departments, although easily accessible to the power of the main engine, was provided with a small Westinghouse engine, it being believed that the additional convenience of being able to run this branch independently of the main shop with a motor suitable in its capacity to the work of that department, would more than compensate for the increased expense of running.—*Exchange.*

**COMBINATIONS OF METAL AND GLASS.**—At last year's Gorlitz exhibition specimens were exhibited of a new ware, partly of metallic luster and partly yellow and red, like amber, topaz or ruby-colored glass. In this new patent process (described in the *Eisen Zeitung*), network of soldered bronze wire, exactly fitting the vessels to be prepared, is pressed into the wooden or iron casting molds, and the mass of glass is then blown in, so that it not only fills up the meshes of the wire netting, but partially surrounds the metallic substance, a durable union of the two component parts being thus effected. The articles are decorated with an

elegant and tastefully arranged filigree work. In some places the wire netting is brought into contact with small plates of the same metal. The difficulty of the process is the discovery of a suitable metallic mixture the properties of which are commensurate with the great heat to which the glass has to be exposed. After the casting the metal is completely black, and has to be gilded to restore its luster.

**A SELF-FEEDING HAMMER** for driving tacks or small nails has been invented by Mr. Emmet Horton, of Dundee, N. Y. It consists of a small hopper or nail receptacle placed above the ordinary hammer-head that separates and feeds nails, and sets and drives them by the swinging motion given the hammer. It holds about one pound of nails thrown in promiscuously, and is designed to be used in all places where rapid nailing is required, such as shingling, lathing, nailing boxes, and a smaller size for upholstering, tacking down carpets, etc. When the device is operated a single nail is forced into a pendent position and so held firmly by springs until the nail is set in its place, then by jerking the hammer upward again the clamp is released from the nail thus stuck in the wood—in other words, the spring clamp slipped from off the struck nail—after which the nail may be driven home by striking it on its head with the hammer-head. It is claimed that in shingling one-third more work can be done than by the ordinary hammer.

**ROLLING SMALL WIRE RODS.**—A patent has recently been granted to Benjamin Weaver, of Pittsburg, Pa., for improvements in rod-rolling mills, which have for their object the rolling of small wire rods such as are used for fence and telegraph purposes. These are at present obtained by what is known as the wire-drawing process, it being impossible to roll the smaller sizes of wire rod with the mills now in use. Mr. Weaver's, it is claimed, will combine in its operation both the rolling and drawing processes. This is made possible by the peculiar construction and arrangement of the mills and their driving mechanism, by which the rod is passed automatically through two pairs of rolls, the second pair of the series drawing it through the first pair. This operation is repeated in succeeding sets or series of rolls until rods of the desired size are obtained. Experiments have, it is said, left no doubt of the practical value of this invention. It is stated that a syndicate of prominent rolling-mill owners have offered Mr. Weaver \$80,000 for his patent.

**HIGH SPEED AND INCREASE OF FUEL.**—A correspondent of the *Boston Journal of Commerce* says: "I have always been told that high speed and high-steam pressure was the most economical way of using steam. I am running a Corliss engine; until recently I ran it 530 feet piston speed per minute. My engine was heavily loaded, and crank pin heated so badly I was compelled to run a small stream of water on it all the time. I increased the size of my driven pulley 20 per cent, and put up my engine to 640 feet piston speed per minute; since that time my crank pin has run perfectly cool, but I find a large increase of fuel consumed. I had a mechanical engineer to indicate my engine as soon as started at the high speed, and he pronounced the valves in fine working order. Will some one tell me why the consumption of fuel has so much increased?"

**PISTON AREA AND HEATING SURFACE.**—However much change may be effected in the type of a locomotive, certain proportions appear to be incapable of alteration without doing harm; 2½ square feet of heating surface ought to be provided for each square inch of piston area, or, what comes to the same thing, the area of one piston multiplied by 5 will give the proper heating surface. Thus, the area of a 17-inch piston is 227 square inches, and 227 multiplied by 5 equals 1135 square feet. In like manner the proper surface for 19-inch cylinders is 1417 square feet. Of course, this is not to be regarded as a hard and fast rule, but it is quite in accord with the best locomotive practice of the day, and that when an attempt has been made to reduce the proportion, the engines have not proved good steamers with heavy trains.

**IMPROVEMENT IN SETTING TIRES.**—Mr. Whitney has adopted a manner of heating driving-wheel tires which is exceedingly practical, quick and economical, and which the writer does not remember to have seen practiced in any other shops. A circular trough, open at the top and having several supports for the tire, extending perhaps three inches from the bottom, is filled almost to the top of these supports with water, after which a gallon of kerosene oil is poured upon the water, which, being ignited, heats the tire so that not more than 15 minutes are required to prepare it for being pressed upon the wheel. This avoids the necessity for building a wooden fire underneath the tire and waiting upon this necessarily slow process. It also avoids the danger from sparks.

CONSIDERABLE interest is awakened in experiments now proceeding in Pittsburg, which seem to prove that excellent steel can be made directly from iron ore by mixing in small pieces with 20 per cent of Rhode Island graphite, reduced in an ordinary heating furnace to a spongy mass, the phosphorus and other impurities flowing off with the slag and the mass being ready to be drawn in two hours.

## SCIENTIFIC PROGRESS.

**GRAVITATION ON THE DIFFERENT PLANETS.**—Among the other wonderful and curious truths which science teaches is the fact that beings similar to those on the earth could not exist on some other worlds, for the following reasons: "It is the attraction of gravitation that makes weight. An inhabitant of our planet could jump to an amazing height in the moon, because its mass is so much smaller than that of the earth. This same effect would be produced upon all other bodies. Horses would travel at a greatly increased speed, and if the rider was thrown the consequences of his fall would be much less serious; the elephant would become as light-footed as a deer; a stone from the hand of a careless boy might fall in an adjoining town before accomplishing its mission of destruction; armies could engage in battles at great distances from each other; and nearly every kind of labor would be lightened, from the diminished weight of tools and materials. In other planets an opposite state of affairs would ensue. Jupiter, Saturn, or the sun, with their immense masses, would exert so strong an attraction that we should scarcely be able to move, and would crawl along as slowly as if our feet were weighted with lead. It is possible, even, that the larger animals would be crushed by their own weight; and, if there were no other reasons, this would be a sufficient one against the theory that the sun and larger planets are inhabited by beings like ourselves."

**PICTURES IN THE FIRE.**—The taste for decorative art finds a fresh field of fancy to manifest itself in through the agency of natural gas. The absolute cleanliness of the gaseous fuel has presented opportunities for converting the fire-sides in many Pittsburg homes into beautiful pictures made of gems of the ceramic art. The general method of decorating a natural gas fire-grate is to partially fill it with finely broken fire-brick. Then over this is laid a layer of long-fiber asbestos. Scattered about in artistic confusion are pieces of bric-a-brac in decorated china, milkmaids and shepherds and shepherdesses, dogs, curious little vases, articles of Japanese bijouterie—the whole making a rare picture when the gas flames play around them. One well-known gentleman residing in the East End has a perfect representation of a winter scene as the adornment of his parlor grate. Salt and asbestos give the semblance of snow and ice, while the background is made of decorated tiles and gives a fine idea of perspective. Another grate in his house gives a farm-yard scene, with house and barn made of fire-clay in colors, with cows, horses and chickens, the farmer and his wife and servants, while a miniature farm makes up the background. The figures are fashioned out of fire-clay. In another room he has a life-sized hen setting on a dozen eggs, while a number of little chicks just half out of the shell complete the picture.

**LIGHT AS A SPEED INDICATOR.**—M. Gustave Hermite has proposed the use of intermittent light to indicate the speed of engines or other moving bodies. His plan is to illumine a Geissler tube by the sparks of an induction bobbin giving a constant and known rate of vibration per second, say from 30 to 40, each vibration giving a corresponding flash of the Geissler tube. By optically arresting the moving objects at different points of their course he proposes to obtain their speed. For example, if a disk of cardboard is made to revolve by clockwork at a uniform and known speed, one turn per second, for example, and if it be lighted by the Geissler tube, giving 30 flashes per second, we shall see the disk 30 times during one second, or, in other words, while it makes one revolution; and if there is a visible spot on its surface 30 spots will be seen. If the disk turn 10 times per second, the succession of images will disappear, owing to the persistence of impressions on the retina, the disk will appear to be immovable, and we shall see three spots on its circumference occupying fixed positions. If the number of turns of the disk is equal to the number of flashes of the tube, the disk will be seen to be immovable. A printed page revolved in this way could be read as if it were fixed. Mr. Winhurst's well-known influence machines illustrate this phenomenon in a very beautiful manner.

**FORCE OF EXPLOSIONS.**—The power exerted by an explosion on surrounding objects is in the inverse ratio of the cube of the distance from the point of an explosion. Thus, at 100 feet from the exact point of an explosion, the power is only the cube of 1.100, or 1.1,000,000 part, of what is at a distance of only one foot from that point, or, in other words, if the power at one foot from the spot be represented by 1,000,000, at the distance of 100 feet it will be but one. It is thus seen that the effects are intensely local, and but comparatively trifling at even short distances. Nitro-glycerine and dynamite do not, when exploded, exert such a force as is popularly believed. To speak precisely, the power developed by the explosion of a ton of dynamite is equal to 45,675 foot-tons. One ton of nitro-glycerine similarly exploded will exert a power of 64,452 foot-tons; and one ton of blasting gelatine similarly exploded 71,050 foot-tons. These figures, although large, are not enormous, and need not excite terror. Seventy-one thousand tons of ordinary building stone, if arranged in the form of a cube,

would measure only 90 feet on the side, and if it were possible to concentrate the whole force of a ton of blasting gelatine at the moment of explosion on such a mass, the only effect would be to lift it to the height of a foot. These figures are said to have been derived from careful experiments.

**WORLDS GREAT AND SMALL.**—The heavens, as well as other parts of creation, have their tiny and almost infinitesimal specks of matter, and also those of immense proportions. Our sun is so large that, if it were a hollow globe with the earth in its center, the moon in its revolution around the earth would represent a disk but little more than half the diameter which a disk through the center of the sun would represent; and yet the well-known star Sirius is thought to be 3000 times larger than the earth. Per contra, the diameter of the two satellites of Mars, which are pronounced by Newcomb by far the smallest heavenly bodies yet known, cannot be stated with any degree of accuracy, but that of the outer satellite may be as small as five miles, while that of the inner satellite lies between 10 and 40 miles. Ceres and Vesta, the largest of the asteroids, are supposed to be between 200 and 400 miles in diameter, while others of the group may be as small as 20 miles, or even less. There are some reasons for believing, indeed, that the ring of asteroids may include bodies of unlimited minuteness—fragments far too small to be visible with the aid of our largest telescopes.

**THE ELECTRIC SUBMARINE CABLE** does not work instantaneously, nor is the first impression at the other end the strongest. After the contact between the instrument and the conductor is made here, no sensation is felt at the station on the other side of the ocean for about two-tenths of a second, when a faint sensation is perceived. This increases in intensity for three seconds. After four-tenths of a second about 7 per cent of the maximum force has been felt; after one second about half of the force has crossed the ocean, and at the end of three seconds the force in a continuous current is as strong as it will be or can be made, unless the battery is increased. The average time fixed by experimenters for a certain ascertained impulse through the ocean cable is four-tenths of a second.

**ANNUAL RINGS OF TREES.**—Prof. D. P. Penhallow, having studied the relation of annual rings to the age of trees, concludes that the formation of rings of growth is chiefly determined by whatever operates to produce alternating periods of physiological rest and activity. In cold climates the rings are an approximately correct, but not always certain, index of age; but in warm climates they are of little or no value in this respect. The influence of meteorological conditions in determining the growth of each season is most important, particularly with reference to rainfall. Periodicity in rainfall corresponds with periodicity in growth.

**THE ROLL OF THE OCEAN.**—It has long been a question of doubt as to how far beneath the surface the roll of the ocean could be felt; but it has generally been supposed that the action of the waves does not extend more than 60 or 80 feet below the surface. The fact, however, has recently been discovered that the wave motion extends to a very much greater depth. A diver at work on the steamer *Oregon*, recently sunk near New York harbor, at a depth of 120 feet, found the roll of the sea so heavy that he could not keep his position while making fast to a trunk which was to be hoisted up.

**JUPITER'S GREAT SPOT.**—The famous red spot which appeared on the planet Jupiter in 1878, and after attracting universal attention and perplexity for five years faded almost entirely away, is reported by Mr. Denning, an English astronomer, to be again becoming darker and more conspicuous. A search of astronomical records has shown that this spot is identical with one seen by two observers in 1843. If such is the case, it must represent some permanent Jovian feature of immense size.

**TORPEDO INVENTORS.**—A circular has been issued from the Navy department, directed to all inventors of torpedoes, or those interested in the subject, inviting them to communicate with Commodore Sicard, Chief of Ordnance. Seventy-five thousand dollars was appropriated at the last session of Congress for the purchase, manufacture or testing of torpedoes, and a board of naval officers, of which Capt. A. P. Cooke is president, was appointed several weeks ago to examine and test such torpedoes as may be submitted.

**THE ELECTRIC LIGHT.**—It is said that Boston contains a larger number of electric lights than any other city in the world. That city also looks more closely after those lights than any other—the street lights. Any defect in an electric street light—unsteadiness or any other trouble—receives immediate attention and prompt and thorough repair. This is the chief reason why the electric light is being more generally introduced there than elsewhere.

**STRENGTH OF ICE.**—It has been found that a sheet of ice three inches thick affords a perfectly safe passage for infantry or horses marching in single file, and for light carriages; with a thickness of six inches it will bear all sorts of wagons and cannon.

**ABOUT BURNING COAL.**—The grading for the new coal shed here is nearly completed and several new side tracks are being put in. The building will be 350 feet long and 60 feet wide, and will be capable of containing 4000 tons of coal. There will be four side tracks in the building, and engines will be loaded by a derrick and donkey engine fixed up on a small flat car. All of the engines running through to Sacramento have been changed from wood to coal burners, but those running to Rocklin, some 15 in number, will not be changed, but will continue to burn wood. The supposition prevails that the railroad company finds it cheaper to burn coal than wood, but a prominent railroad man informs us that such is not the fact. While the first cost of wood is a little more than coal, yet when the effect of coal upon machinery is taken into consideration, it is said that wood is the cheaper. With the use of coal, the fire-boxes and flues of locomotives soon burn out and have to be replaced every few years, and the gritty cinders adhering to the working parts of the machinery cause them to wear rapidly. In wood burners the fire-boxes seldom have to be replaced, and there are several engines in the division that still contain the same boxes which were put in at the time of their construction, nearly 20 years ago. Therefore, wood is considered the cheaper fuel. Other motives than those of economy seem to have moved the railroad company to make the change they have. We hope that the change will not be a permanent one, as a serious blow would be dealt to one of the important industries of this vicinity.—*Truckee Republican.*

**A GREAT DROUTH AT THE EAST.**—A prolonged drouth is one of the worst afflictions which can come upon our eastern friends, who count upon frequent showers during the summer and fall. In California our conditions and calculations are different and summer showers are unwelcome. The area east of the Rocky mountains which has suffered this season is very large. It covered the great country from Texas to Wisconsin and seriously affected grazing and dairy interests. We have not followed the subject closely and cannot say how far eastward of the prairie States the drouth extended, but present reports are of severe lack of water in New England. It is said that springs and wells in some of the southern counties of Vermont, that were never known to fail before, are now dry, and great difficulty is experienced in getting water for the stock. In the vicinity of Wareham, Massachusetts, families can with difficulty secure water enough for domestic uses. The various ponds and small lakes are very low. A trench has been dug to connect the Little Quittams' pond with Acushnet river in order to increase the water supply for the town of New Bedford. Throughout the States mentioned the drouth is widespread.

**A LONG-HEADED DUMP PICKER.**—Miners will enjoy the following story, which loses none of its flavor although it comes all the way from Ishpeming, Michigan. A good-natured tramp applied at the mines for work as a sort of extra. One day he would work and two days he would loaf. After awhile he went to the Winthrop Hemetic Co.'s mines and offered 25 cents per ton for the dumps, to be paid as they were removed. The company gave him a contract, and he also bought the dumps of neighboring mines at the same price. After the contracts were signed, he dropped his character of a tramp, reappeared as a business man, set a crew of men to work sorting the dump, which turns out to be 50 per cent of ore worth \$5.50 per ton. The Winthrop dump netted him \$1,000,000, and the other dumps about \$4,000,000. Jones has the dumps and the mine-owners have the dumps, so it's an even set-off, begging your pardon, gentle reader, for the pun.

**MANUFACTURERS' ASSOCIATION.**—The new Directors of the Manufacturers' Association of California have organized by electing the following officers: W. T. Garratt, President; William Harney, Vice-President; N. W. Spaulding, Treasurer; Geo. C. Hickox, Secretary. After appointing Executive and Finance Committees, the Association resolved to hold public meetings more frequently, when questions of interest can be discussed and papers of importance read. Professor W. B. Rising, of the State University, will read the first of a series of papers at the annual meeting, to be held Monday evening, November 22d, at the Pavilion. The recent amendments to the by-laws extend the right of membership and bring it within reach of all engaged in any industrial pursuits, and the new spirit manifested by the Directors to give vigor and usefulness to the organization gives promise of success.

**TEMPERING BRASS.**—Brass, not hard by mixture, but by compression, either rolling, hammering, wire-drawing, or any other process which compresses the particles of metal, can be tempered regularly, just as easy and in the same manner as you would temper an equalized piece of hardened steel, viz., by heat. By placing a small piece of polished steel on the brass object to be tempered, and applying the heat so as to affect equally the brass and steel, you will know by the color of the steel the temper of the brass, which by this process may be tempered in exact proportion to every shade of color of the steel.

The pay-rolls of the Comstock mines for the month of October foot up about \$137,000.

## USEFUL INFORMATION.

**DANGER FROM TARRED CAST-IRON WATER PIPES.**—For some weeks past tarred cast-iron pipes have been used for the supply of water in urban districts. That the tarring operation ought to be executed with the amount of care that it does not always receive, appears clearly from a report on the subject recently published in *Stahl und Eisen* by Dr. Thorner, analytical chemist, of Osnabruck. After an exhaustive consideration of the subject, Dr. Thorner concludes as follows: "To sum up the results, both of analytical and synthetical experiments made, it is now fully demonstrated that in badly tarred pipes in which the water is liable to recede and the pressures are consequently subject to many variations, hydrate of iron is formed in quantities large enough to render the water unfit for human consumption. Valves may be used to prevent the water from receding, but, notwithstanding this, variations of pressure of such magnitude take place in most conduits that it becomes imperative to apply the utmost care to the tarring operations." Dr. Thorner recommended that the pipes should be previously painted over with a suitable substance, such as alcohol, petroleum, essence of paraffine, etc. These substances should, however, be selected with due regard to their properties, especial care being taken that they should commingle well with the tar. Thus the tar may be heated in a vessel with the application of a worm, and when a coating of petroleum has been applied to the surface of the pipe it may be stood upright in the tar vessel, and both the painting over and dipping may take place gradually. The principal thing is, after all, that the pipes should be perfectly clean and that there should be no spots of rust on them at the moment when the operation takes place.

**ARTIFICIAL PUMICE-STONE.**—At Bietigheim, in Germany, and Pilsen, in Austria, natural pumice-stone has been superseded by an artificial stone, to which a suitable shape can be given and different degrees of fineness of grain obtained, which allows the stone to be used in all the industries where natural pumice-stone was formerly employed. The ingredients are white sand, feldspar and fire-clay, mixed in suitable proportions to obtain the desired composition. The paste is poured into plaster molds, and then placed in fire-clay receptacles and baked in ovens. At Bietigheim, sand of various thicknesses is prepared by means of sieves, and each thickness corresponds to the different numbers of the stones. The feldspar is used in a calcined state and in almost impalpable powder. The sand is white, very fine, and contains a great quantity of vitreous matter. The fire-clay is very pure and contains no sand. About 60 per cent of powdered feldspar and 5 per cent of diluted refractory earth are added to the sand, and this mixture, after receiving the necessary quantity of water, is poured into plaster molds.

**A TRANSPORTABLE ELECTRIC LIGHT TOWER** has been lately invented by M. Beduwe, a builder in Liege. The idea is to furnish the light in any place on short notice, and it is thought the apparatus might prove useful in public works, cases of accident, gatherings in public places, fetes, etc. The constituent parts are (1) a telescopic system of copper tubes bearing the light; (2) a three-cylinder steam engine to drive either a Gramme machine or a suction and force pump; (3) a vertical boiler on the tubular system, and (4) a reservoir for water. The whole is mounted on a four-wheeled carriage. The light is raised by hydraulic force.

**TO OBTAIN mother-of-pearl designs on tissues,** a thin layer of caoutchouc is spread over a thin copper plate and the design is carved in the same. The tissue is laid over the copper plate and a hot cylinder is rolled over it. The heat liquefies the caoutchouc, and this remains sticking to the tissue, which is then covered with mother-of-pearl powder and a hot cylinder is rolled over it. The excess of mother-of-pearl powder is brushed away, or the cloth is shaken. In order to prevent the powder falling from the tissue, this is covered with fine crepe which has been first dipped in gum water.

**A LIVELY APPETITE.**—A reputable scientific authority quotes the statement that, by careful estimate, a spider ate 4 times its weight for breakfast, nearly 9 times its weight for dinner, 13 times its weight for supper, finishing up an ounce, and at 8 P. M., when he was released, ran off in search of food. At this rate a man of 160 pounds would require the whole of a fat steer for breakfast, another with a half-dozen good sheep for dinner, and two bullocks, eight sheep and four hogs for supper, with about four barrels of fresh fish as a lunch before going to his club banquet.

**TO SOFTEN BRIGHT WORK.**—To soften bright work without damaging the finish, place the pieces in an iron box and fill in the interstices with iron turnings; close the box, lute the cracks with fire-clay and heat to a red, allowing the box to cool as slowly as possible. It is a good plan to let the furnace fires go out and leave the box in the furnace to cool.

**HOW TO PREVENT CROWING.**—It is admitted that in the act of crowing a bird stretches his neck to its full extent. A small lath, loosely

suspended about 18 inches above the perch, will obviate this. It in no way interferes with the bird's roosting; but the moment chattering commences a nuisance the swinging lath comes gently in contact with his comb and effectually stops him. I have a dozen birds and none of them presume to crow till the hour that I let them out.

**ALL sediment cocks in kitchen boilers** should be left open at least once a week for the space of 15 minutes, so as to clean and wash out all foul sediment. Oftentimes when complaint is made that the water smells, or that it doesn't heat properly, the real cause will be found to arise from this neglect alone.

**FURNITURE** needs cleaning as much as other woodwork. It may be washed with warm soapsuds quickly, wiped dry, and then rubbed with an oily cloth. To polish it, rub with rotten-stone and sweet oil. Clean off the oil, and polish with chamois skin.

**COPPER TELEGRAPH WIRES.**—It is stated that Roehling's Sons have this year used more than 1000 tons of copper in the manufacture of telephone and telegraph wire, and that copper is being substituted for iron very generally for these purposes.

**PAINTING ZINC WORK.**—There is no absolute need of painting zinc work, for exposing it to the atmosphere has the effect of coating it with a thin film of oxide which separates it from the further action of the air as effectually as paint does.

**TO KILL GREASE-SPOTS BEFORE PAINTING.**—Wash over smoky or greasy parts with salt-peter, or very thin lime whitewash. If soap-suds are used they must be washed off thoroughly, as they prevent the paint from drying hard.

**LEAD AND OAK WOOD.**—Plumbers should be careful not to use lead in connection with oak, unless the latter is perfectly dry and free from sap, otherwise the gallic or acetic acid in the wood will turn the lead into acetate of lead.

**THE TYPE-WRITER,** now in such common use, dates back to 1714, when Henry Mill got a patent for it in England; but it was not really made practicable until 1867. It now seems indispensable.

**WHY NOT HERE ALSO?**—Unclaimed dogs in London are killed painlessly by being sent to sleep in an atmosphere of chloroform, bisulphide of carbon, and carbonite oxide.

## GOOD HEALTH.

### Swallowing Edge Tools.

The Academy of Medicine in Paris has just been listening to a report from M. Polaillon on an unusual surgical operation which ended successfully. The case was that of a young man who, out of bravado, had swallowed a fork. It was extracted by an incision in the stomach. For many days after, the patient confined himself strictly to a diet of soup and iced champagne. Later on he took some milk, and on the twelfth day was allowed a cutlet. He is now quite well.

The above will remind some of our readers of a case reported in this paper, about a year ago, of a young man who swallowed a small open penknife, at the residence of his parents, near Port Costa, in this State, which, however, was removed by natural means, two days later, while the young man was under the care of a physician in this city.

Another case of fork swallowing, in France, has recently been reported with the following particulars: The surgeon was afraid to cut into his stomach lest he should not find the pronged implement there, and would thus still more endanger the patient's life. An electrician, M. Trouve, was then called in, who devised a *sonde œsophagienne* connected with an electrical apparatus and a bell, and made in such a manner that contact with a metallic substance allowed the passage of the current and made the bell ring. The bell was heard very distinctly. In addition, he made some very simple as well as convincing experiments that the surgeon ought to have thought of. He placed a very sensitive magnetic needle in the vicinity of the patient, and saw the needle turn toward him. He brought a large electro-magnet into the vicinity of the stomach, and each time the current was on, the fork came toward it, upheaving the skin and muscles of the abdominal walls in a marked manner, and at length the surgeon was convinced and he performed the operation.

**MEAT SHOULD BE BOLTED, NOT EATEN.**—Mr. Gladstone is "out of it" again. Everybody has heard how the late Prime Minister ascribes his splendid health to having learned one simple physiological lesson, namely, to make 25 bites at every bit of meat. Mr. Littleton has recorded the fact in his little book on training, and Sir John Lubbock repeated it the other day in an address on technical education. And now there comes a "Physiologist F. R. S.," who writes to the *Times* to say that the pretty little tale is merely "another illustration of great ignorance of natural things in the pres-

ence of high and even wonderful conceptive faculties." So far from needing 25 bites, meat does not need any bites at all, for it is digested not by the mouth juices (as vegetable substances are) but by the stomach juices, and as the secretions of the mouth are alkaline, whereas the digestive fluid for meat is acid, too much mastication actually interferes with digestion. So Mr. Gladstone must go to school again after all, and learn the old nursery saw, "to boil the meat, but chew the potatoes."

**BREATHING THROUGH THE MOUTH.**—Tight dressing, though the most serious hindrance to the habit of good breathing, is not the only obstacle. There are careless ways of sitting and standing that draw the shoulders forward and cramp the chest, and it is as hard for the lungs to do good work when the chest is narrow and constricted as it is for a closely bandaged hand to set a copy of clear, graceful penmanship. Then there are lazy ways of breathing, and one-sided ways of breathing, and the particularly bad habit of breathing through the mouth. Now, the nose was meant to breathe through, and it is marvelously arranged for filtering the impurities out of the air and for changing it to a suitable temperature for entering the lungs. The mouth has no such apparatus, and when air is swallowed through the mouth instead of breathing through the nose, it has an injurious effect upon the lungs. A story is told of an Indian who had a personal encounter with a white man much his superior in size and strength, and who was asked afterward if he was not afraid. "Me never afraid of man who keeps mouth open," was the immediate reply. Indeed, breathing through the mouth gives a foolish and weak expression to the face, as you may see by watching any one asleep with the mouth open. It may be noted that an anemic or low condition of the blood is seldom found where there is an established habit of full, deep breathing with the mouth closed.—*Helen Clark Swazy, in St. Nicholas.*

**SLEEP AS A TONIC.**—A scientific writer says: Sleep, if taken at the right moment, will prevent an attack of nervous headache. If the subjects of such headaches will watch the symptoms of its coming, they can notice that it begins with a feeling of weariness or heaviness. This is the time when a sleep of an hour, or even two, as nature guides, will effectually prevent the headache. If not taken just then it will be too late, for after the attack is fairly under way it is impossible to get to sleep till far into the night, perhaps. The giving of anodynes and the forming of the disastrous opium habit has often arisen out of such circumstances and ignorance of the preventive value of sleep. It is so common in these days for doctors to forbid having their patients awakened to take medicine if they are asleep when the hour comes round, that the people have learned the lesson very well, and they generally know that sleep is better for the sick than medicine. But it is not so well known that sleep is a wonderful preventive of disease—better far than tonic regulators and stimulants.

**MILK AS AN ODOR ABSORBENT.**—Those dairymen who do not believe in the power of milk to rapidly absorb and become contaminated by surrounding noxious smells will do well to try the following simple test, the results of which will doubtless immediately convince the most skeptical: Take a wide bowl or soup-plate to the cow stable when you go to milk; pour into it a pint of fresh milk, set it on the floor or at the height of a milk-stool, so as to expose it fully to the air of the stable, behind and close to the cows. If the day is close and heavy and the milk is cold, and the stable not cleaned out and aired, the result will be surprising. Take it to the house, or anywhere away from the stable, and try to drink it.

**SUGAR AS AN ARTICLE OF DIET.**—Dr. Phipson advocates, in a German scientific journal, the general use of sugar as a regular article of diet. For 40 years he has eaten at least a quarter of a pound daily, not counting sugar-forming substances taken at the same time, and has found it very healthful. Man's condition would be greatly improved if the use of sugar should substitute that of alcohol.

**STRENGTH OF BLOOD-VESSELS.**—Experiments reported to the Paris Academy of Sciences prove that the pressure necessary to cause the rupture of blood-vessels is very much greater than that to which they are normally subjected. The carotid artery of a dog required from 35 to 55 times the normal pressure of the blood, and the jugular vein from 32 to 35 times the usual force.

**TARWEED FOR MEDICINE.**—The *Vallejo Chronicle* says: "For the past few days a man has been at the navy yard clearing out the tarweed that grows in such abundance at the rear end of the island and bringing it over to Vallejo. He is going to dry the weed and use it for medical purposes. Several truckloads will be cut. It is worth \$1 a pound when properly dried."

**POISON OAK ANTIDOTE.**—A standing antidote for poison by poison oak, ivy, etc., is to take a handful of quicklime, dissolve in water, let it stand half an hour, then paint the parts with it. Three or four applications, it is said, will cure the most aggravated cases.—*New York Herald.*

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**DOWNS.**—Amador Ledger, Nov. 13: The sinking operations at this mine near Volcano were finished the 12th of last month. The shaft was sunk 200 feet, making a total depth of 700 feet, by far the deepest shaft in the upper section of the county. A drift at the 700-foot level has been run 60 feet in one direction and about 30 feet in another. So far no developments of any importance have been made, although the drifts have about reached the points where it was expected to encounter the ledge. The pumping machinery is working satisfactorily.

**MISCELLANEOUS.**—The pumping machinery will soon be placed in position at the McKay mine. This will enable the water to be controlled and sinking prosecuted at the same time. The new five-stamp mill in process of construction at Clinton, for S. G. Spagnoli, will be completed in a day or two. At Middle Bar, mining matters are quiet. At the Sargent claim they have a large quantity of ore on the dump, which, we are told, is to be shipped out of the county for treatment. At the Big tunnel there is nothing new to report. The Moore mine is running slowly, with six or eight men employed.

**SUTTER CREEK.**—Twenty stamps of the Mahoney mine were started the latter part of last week, and have been running steadily ever since. The dump is full of ore, but the other stamps will not be started for some time yet. There is plenty of ground to operate upon, and if it pays, the prospect is good for a long run. Another slight accident occurred at the South Spring Hill mine a few days ago. The old ore bin gave way, letting the ore on the ground. A new bin has been constructed. There is renewed talk of starting up the Wildman mine. The property was bonded nearly a year ago to John Tregloan, Sr., and it is reported that he has succeeded in organizing a company in New York which will commence operations very soon. The Amador canal is running short of water, and considerable machinery is idle in consequence thereof. A good rain is anxiously looked for.

## Calaveras.

**ANGELS MINES.**—Mountain Echo, Nov. 10: It is reported that operations will be resumed at the Gold Cliff mine in a few days. Clark & Maltman have recently purchased a Kendall mill, and will put it in position at their mine as soon as the machinery arrives. The Utica mine is running full-handed night and day. Some high-grade ore is now being milled and it is expected that a large cleanup will be the result of the present run. A slight cave took place in the old works one day last week; no damage was done. The Stickle mine and mill is running in full blast. Some very good rock is being stoped in the north end, and everything looks favorable for an abundant yield of the precious metal at the next cleanup. The Stickle is a model mine and bids fair to prove the best mine in the county.

## El Dorado.

**CRUSHING.**—Georgetown Gazette, Nov. 13: Two weeks ago 80 tons of ore was crushed in the Eureka mill from the Alpine mine near town, the result of which is only known to the owners. The opinion of those who saw the plates at different stages of the crushing is that the ore yielded very fair returns. What has since been done shows most conclusively that the yield justifies a further development of the mine. One hundred and twenty tons is being hauled to the Eureka mill, which is now nearly all in, and the mill will start up right away. Further, Supt. Lindsey has just furnished the mine with a new 15-horse power steam engine for pumping and hoisting. All in all, the Alpine promises to become a big property. Already many thousands of dollars have been paid out to resident laborers for work of developing the mine, to say nothing of the supplies furnished by our merchants.

**HART.**—Work of development on the Hart mine, (two miles south of town) continues right along. Last week, Ad. Porter, Cliff Cheek and Ben Robson entered upon contract to run 100 feet of tunnel on the ledge from the point where the ledge was tapped last month by the main tunnel. The paying character of this mine has not yet been satisfactorily determined, but Supt. Morton will not stop short of a thorough test.

**MUD SPRINGS.**—Placerville Observer, Nov. 13: Owing to the rich mining developments in and around Mud Springs, arrangements are complete for putting on a line of stages between that place and Plymouth. The stock will be of the best, and the trips are to be made tri-weekly.

**GRAND VICTORY.**—During the week we had occasion to visit the Grand Victory mine, and were gratified to see the many substantial improvements made in and about the mill. A large ore bin has been built in the rear of the mill, besides two new rock-breakers which have just been completed. Ten stamps were running and we were informed by B. B. Bunker, who has charge of the mill, that within the month the additional stamps would be put in motion. A large force of miners are employed and men are being added to the mining force daily. The ore body is simply immense, there being enough in sight to keep the mill running steadily for two years. Surely the prospects of the Grand Victory are very flattering.

## Fresno.

**MT. RAYMOND DISTRICT.**—Cor. Fresno Republican, Nov. 12: "Mt. Raymond district, situated on the north side of Fresno county, is but little known of outside of its own vicinity, yet it is destined to become one of the greatest mineral producers on the Pacific Coast. Looking nearly north from Fresno city, Mt. Raymond is visible on any clear day, standing out bold and majestic on the northern horizon. Mt. Raymond mining district was formed in 1882. But little development has been made as yet, as the parties owning the principal mines here are men of limited means. Several efforts have been made to induce capital here, but the undeveloped condition of the district and depreciation in the price of silver has been the principal drawback in inducing capitalists to invest. Mr. Ulyard, a practical mining man and assayer,

came here this fall, and, being surprised at the amount of ore in sight and at the immense large lodes, concluded to give them a thorough test, which had never been done before. To the great surprise of every one he has discovered that gold as well as silver exists here in large and paying quantities. Lodes that were considered worthless are found to be rich in gold. Mr. Ulyard is at the present time, with the assistance of some Fresno gentlemen, developing a lode which is proving beyond a doubt to become a famous bonanza. The writer predicts prosperity near at hand for this district. On the 30th of October Mt. Raymond put on her first coat of winter in the form of one foot of snow, and winter has apparently set in, although we may yet have several weeks of pleasant weather.

## Lake.

**SHUT DOWN.**—Lower Lake Press, Nov. 13: We see from jottings of our Middletown correspondent that the Great Western mine has indefinitely shut down. We cannot understand why this should be done, when it appears that that mine produced a larger quantity of quicksilver than any other mine in this part of the State for the month just past. Quicksilver is now very high and it seems quite strange that so valuable a mine, in productiveness, should cease operations. Mr. Andrew Rocca, the superintendent of the mine, is one of the most accomplished and successful miners in this State. He has tided the Great Western over many and trying difficulties, and in doing so has shown great genius and ability as a mine governor. And there were very trying times a year or so ago, when quicksilver was at its lowest ebb, and mine after mine was closed because of depreciated value of their product. But the Great Western, under Mr. Rocca's able control, survived the difficulties then attending and has been yielding profitably all the time.

**MAMMOTH.**—Placer Republican, Nov. 14: Col. Davis had the best of good luck at the Mammoth Bar mine this season. Not a break has occurred in the machinery and the hydraulic lift has proved a success. Good pay has been taken out all the time and the proposition demonstrated that the best ground had never been worked. It will take years to work out the claim.

## Mariposa.

**CHISPA.**—Gazette, Nov. 13: A chunk of gold weighing ten pounds and six ounces avoirdupois weight, was brought over from Sherlocks about two weeks ago by Capt. Diltz. It was taken out of the Diltz mine, and is here on file as evidence of the sort of country that is around Sherlocks, Saxtons, Colorado and Whitlocks. There is some rusty, iron-stained quartz blended with the gold, but probably not amounting to ten per cent of its entire weight. It is estimated to be worth about \$2000. Some smaller pieces of the same sort were found nestling close to the parent nugget, and there are strong symptoms of more of them in the immediate neighborhood.

## Mono.

**BODIE.**—Bodie Miner, Nov. 15: Winze below the 700 is extended 8 feet. East crosscut from south drift, 800, is extended 17 feet. We are crushing about 25 tons of ore per day.

**BULWER CON.**—North drift, 75-foot level on the Stonewall ledge, is extended 20 feet in fair ore. North drift, east ledge, 100-foot level, 18 feet in fair ore. North drift, 200-foot level, Stonewall ledge, is extended 16 feet in fair ore. The vein is 2 1/2 feet wide. We shipped to the mill 400 tons of ore average pulp assay, \$24.35. We are cleaning up at the mill, and will ship bullion to-morrow.

**MONO.**—We are taking out ore below the 700.

**STANDARD CON.**—South drift, 300 level, advanced 15 feet; west drift, same level, advanced 17 feet; north drift, same level, advanced 12 feet; upraise, same level, advanced 14 feet; north drift, No. 2, same level, advanced 13 feet. South drift, 1000 level, advanced 20 feet. Ore shipped to mill, 330 tons. Mine looking well.

## Nevada.

**THE OLD STYLES MINE.**—Foothill Tidings, Nov. 10: "The Styles ledge, on Deer creek and nearly in the town of Nevada City, used to be a good mine and with great promise many years ago. It is now to be worked for results. The Transcript says that Edwin Tilley & Co. have completed their contract of sinking the shaft at the Styles mine an additional hundred feet. The prospecting of the ledge will now commence, and the State of Nevada capitalists who have a bond on the property will soon be able to determine whether they want to buy the property or not.

**MACHINERY.**—Nevada Herald, Nov. 9: Two or three loads of machinery for the Baltic mine, above Washington, passed through town a day or two ago. The company are erecting a 10-stamp mill, and making other additions in the way of a permanent plant.

**GRASS VALLEY NOTES.**—Union, Nov. 13: At the Badger mine, work is going on with splendid prospects ahead. The walls are no less than 8 feet apart, with two feet of quartz which shows well in bright, free gold and very rich sulphurets. There is considerable rock now on the dump, and scarcely a piece can be picked up but shows well in gold and heavy sulphurets. It looks very much as though the rock being taken out of the shaft would pay the expenses of the sinking. The main shaft is about 250 feet deep. The Crown Point continues to look well. The ledge on the 300 level is from 5 to 7 feet wide; all good milling ore. In the stopes of the 180 level the ledge continues large, and is very rich. There is no telling what may be developed in the Crown Point as the shaft grows deeper. Some very rich rock was brought to town yesterday from the Coe mine, it being taken from the main drift, about 100 feet west of the works of J. Manseau, on the same ledge. A shaft has been started west at a depth of about 100 feet, and the ledge in the face of the drift is two feet wide, of splendid rock, showing gold in all directions. In fact there was never better rock taken out in this district than that now being taken out of the main shaft. Mr. Manseau, who has a contract to work a portion of the ground east of the main shaft, is also taking out some very fine ore, and has several tons now on the dump which will pay handsomely. There is nothing being done at present on the Powning mine, the eastern extension of the Coe, but there is every reason to believe that there is as good rock in the Powning as in the Coe, and work will probably be resumed before many

weeks. Work on the W. Y. O. D. (Work Your Own Diggings) claim, near the Pennsylvania mine, is progressing favorably. A shaft was sunk some time ago, to the depth of 70 feet, and a tunnel run for the ledge. At a distance of a little over 300 feet, the ledge was cut, which is of good width, and shows well in the yellow metal. The claim is owned and being worked by a number of Grass Valley young men, and from the present outlook the boys have a good thing. The mining outlook in Grass Valley district was never better than at present, and the several prospects that were commenced 6 or 8 months ago begin to assume the proportions of mines in fact.

**DELHI.**—North San Juan Times, Nov. 11: We have had no news concerning the Delhi mine for a week. All we know concerning the Delhi is that the company is still running its tunnel ahead with a view of tapping the ledge as near the mill as possible. The rock milled is rich, and hopes are entertained of a continuance of the same kind of rock for months to come.

**THE IDAHO MINE.**—Foothill Tidings, Nov. 10: There are but a few smoldering sparks in the old shaft at the Idaho mine, and cool judgment and prompt action are accountable for that condition of affairs. The old shaft is entirely blocked from the balance of the mine, so that there is no danger of the fire spreading elsewhere. This morning the mine was entirely free from smoke in its lower levels and the miners went to work on regular time. The mill will be closed down about 18 hours, commencing at 12 o'clock Sunday night. In a conversation with the Messrs. Coleman they stated to us that the loss would probably be in the neighborhood of \$2000 or \$3000 to the company.

**A TEST ON WHICH MUCH DEPENDS.**—Transcript, Nov. 16: The sacking of 10 tons of ore from the Central mine, near this city, preparatory to shipping it to the reduction works at Reno, where a test working will be made to ascertain the true value of the deposit, began yesterday. If favorable results are obtained, the gentleman who has the bond on the claim and his associates will have no difficulty in getting certain capitalists to proceed with the development of the lode.

**PENNSYLVANIA MINE.**—Tidings, Nov. 16: Work in the above mine is going forward with energy. A crew of picked and experienced miners are underground, among them being James Gluyas, foreman, John S. Lick, Wm. Curnow, Robert Hicks, Wm. Dunstan and others. Ore is now being taken from the very bottom of the incline, which is 240 feet in length, and the ore looks well. It is estimated that this ore, at the very least, will pay \$75 to the load. This at the deepest workings augurs well for the Pennsylvania. The last three crushings from this mine averaged, sulphurets included, \$45 a load. The new crew of miners will tumble the pay stone on to the dump pile in a rapid kind of a way.

## Placer.

**NORTH FORK DAM.**—Placer Republican, Nov. 10: It is expected that the new work on the North Fork dam will be completed to-day or at least this week. Mr. Ambrose has had a large force of men there since October 13th, and they have accomplished an immense amount of work. They have been favored by unusually good weather at this time of the year, since very little rain has fallen and the river has remained low enough to make the work on the dam possible. They began by building a wing dam one-quarter of a mile above the big dam, so as to turn the water over to the south bank of the river. At this end of the dam where the bulk-head was torn away last winter, they sank down to bedrock, on which was built a solid buttress of timbers and stone 28 feet high. On this is built the new well-house of big timbers and two-inch planks, with sand gate and everything complete. It is stayed and anchored so that it is impossible for it to be carried away, and it will certainly last longer than the dam itself, which good judges say will not hold out more than five years at the best. For at least that length of time the ranchers and miners who are dependent on the North Fork ditch will probably have no more trouble. Shurtleff & Robinson are still having good luck in the Doig and St. Patrick mines at Ophir. Mr. Shurtleff was in town last week with a big piece of quartz literally covered with free gold, and the handsomest specimen seen in Auburn for some time. Mr. Shurtleff also showed a curious specimen in the shape of quartz crystals held together by gold sulphurets and masses of silver. Miners say it is the first specimen of that description ever found in this part of the country.

## San Bernardino.

**CALICO DISTRICT.**—Calico Print, Nov. 10: Since the cold weather set in the activity of mining operations in Calico district has increased considerably, especially in that character of mining called chloriding. Considerable prospecting is going on and rich finds are reported every few days. The principal mines of the camp, the King, Waterloo, Sue, Red Jacket, Garfield group and Silver Odessa, are working the usual number of men, sometimes rich deposits of ore being struck which causes the bullion yield to run above the average. The ore from the Waterloo keeps the 15-stamp mill of the Oro Company busy night and day, and it is reported that the mill will be increased in capacity in order to crush the ore from the other mines belonging to this company. The Waterloo has several hundred feet of openings, which require considerable timbering on account of the loose character of the rock. There is an immense quantity of ore in the mine, the quality of which is sufficient to pay a good profit in spite of the low price of silver. As developments progress the number of miners is proportionately increased, and in a few months a large force of men will be working in the many drifts. The Sue has reached a depth of several hundred feet, and there seems to be no end of the ore, which pays well and is hauled to the Waterman mill every other day. The King is being prospected in the lower levels with renewed vigor, and the indications of rich developments in the near future are good. The Garfield mine is filled up with rich ore, the accumulations of many months, which is being reduced at a lively rate by the new 15-stamp mill of the Runover Company. The Thunderer and the other mines connected with the Garfield are being thoroughly prospected and developed, the ore continuing in paying quantities as the work progresses downward. The ore taken from this group of mines will soon run up into the millions of dollars. The Red Jacket

is turning out several tons of ore daily, which is crushed at the Waterman mill. This mine is developing into a good-paying property. The Silver Odessa group of mines keeps the Odessa mill at Hawleys in constant operation, and turns out the usual amount of bullion. The low price of silver caused operations to diminish a little on these mines, but since silver commenced to raise operations have commenced to increase, and soon a large force of men will be at work delving in the rich deposits which still remain and which will most likely continue to show up for years to come. The Humbug has several men at work quarrying out the ore in the usual manner and netting profitable returns from their labors. Operations are confined to the surface comparatively, and the quantity of the ore seems to be inexhaustible. Chloriders on the Blackfoot, Kearsarge, Comet, Invincible, Little Waterman, Josephine, Red Cloud, Bismarck and others are all doing unusually well, turning out an amount of ore considerable in the aggregate. The Iron Clad, situated just west of Calico, is being worked at a point a few rods above and west of Wall Street canyon. It is owned by H. B. Stevens, E. E. Stacy and G. H. Cook, and was given the above name on account of the heavy iron croppings on the claim. Mr. Stevens recently commenced to prospect on the ledge, which is two or three feet wide. After sinking a few feet he broke into a small cave about five feet in diameter, which presented a fine showing of ore. The Silver Monument, in the edge of the east side of town, directly opposite the Iron Clad and as favorably located, is showing up splendidly. The three companies chloriding on the same have increased their force of men, and are taking out in the aggregate from 12 to 15 tons of 30 to 75-ounce ore daily. Stevens, Wilson & Co. have worked 12 days and sunk over 20 feet, taking out over 1000 sacks of ore ranging from 30 to 75 ounces to the ton. The showing now is better than when they commenced. Allyn, Madison & Co. have also sunk a shaft to about the same depth as the other parties. Within the past eight days they have taken out over 400 sacks of ore ranging from 25 to 100 ounces. The Harwood boys, who have been working diligently for about three weeks, have run a cut in from the east side of the hill about 50 feet and sunk a shaft over 50 feet. They have taken out about 700 sacks which assayed from 30 to 75 ounces, the average assay being about 45 ounces. The ore lies in blankets or deposits and extends over a considerable portion of the claim. It is easily worked and a good deal of it will pay without assorting. The chloriders have a prospect of making handsome stakes before the expiration of their leases.

## Shasta.

**BULLYCHOOP DISTRICT.**—Associated Press Dispatch, Nov. 10: The Bullychoop mining district is exciting much interest in Northern California. The Mammoth mine is uncovered, and shafts sunk upon the same show an ore deposit of about 40 feet in width, the entire deposit milling \$20 per ton. It is free gold bearing quartz. The steam-mill is now crushing 15 tons per day. A great many prospectors are now in the camp, and more are daily arriving. The Stevens hotel is filled beyond its capacity. One hundred men are at work, and great preparations are being made for the winter. The district is 6000 feet above the level of the sea, and it is now conceded beyond a doubt that the district is a success. Many new buildings are being erected. The principal property of the district belongs to Senator Foster and Judge Wallace.

## Sierra.

**TENNESSEE RAVINE.**—Sierra Tribune, Nov. 13: Fine pay gravel has been struck at the Tennessee Ravine near Poker flat, in the diggings owned by Thos. Corlett. These same diggings were worked seven or eight years ago and abandoned. Three years ago Mr. C. again commenced work there and continued with ordinary success, until about four weeks ago, when for a large number of days he panned out \$175 to \$200 a day. His is the only place on the ravine that carries quartz gravel.

**THE YOUNG AMERICA MINE.**—The cleanup at the Young America mine for the month ending October amounts to \$34,000. A dividend of 4 per cent has been declared. During a portion of the month only 15 stamps were running, because of insufficiency of water at the mill. This shows itself in the result of the cleanup.

**THE CALICO MINE.**—The many rumors concerning the richness of the ledge at this mine appear to be well founded. The Tribune reporter paid a visit to the ledge last Sunday, and personally took from it some rock which, on being pounded up, prospected remarkably well. The ledge is about four feet wide. One of the owners (a Chinaman) sold his one-fourth interest the other day for the sum of \$1000.

**CHLORINATION WORKS.**—The Sierra Buttes Co. are making strong efforts to remedy the "smoke evil." Mr. Preston stated to a Tribune reporter that costly experiments with a view of conveying the smoke without the city limits, are daily being made.

**THE EMPIRE MINE.**—Operations at the Gold Valley mine have been partially suspended. Only a few men are now at the mine. Next spring work will be commenced with renewed vigor and activity.

**BUNKER HILL MINE.**—Work has again been resumed at the Bunker Hill mine, Howland flat, which recently discontinued operations on account of the petering out of their pay gravel. Nich Barrett is said to have struck good pay gravel there.

## Tuolumne.

**SOULSBYVILLE.**—Cor. Union-Democrat, Nov. 13: Mining is dull at present, owing to there being no water. Several mining men from below have been looking at different mines in the mountains, and, no doubt, they will make some investments in the near future. The Soulsby mine is entirely closed down until water is turned in the Soulsby branch ditch, and that will not be until sufficient rain falls to start the streams in the mountains; nevertheless the mine looked fine when closed down, and no doubt will turn out considerable bullion the coming winter. The Black Oak mine is closed down for the same reason as the above. The owners are below. It is reported that the mine will change hands soon. They will no doubt do considerable work this winter. The Rising Sun mill and mine has been purchased by a S. F. Co. and work has been commenced on a small scale (cleaning out ditches and one of the tunnels), pre

paring to start up in full blast when water comes. Messrs. McCann & Hamilton are doing work on the Basin mine on the east side of the north fork of the Tuolumne river. They have a good property. I feel confident that it is one of the best mines in California, and if their company invests in it they will be well paid for their investment after machinery is erected to work the mine and crush the ore. In this mine they have six veins, three principal and three smaller ones. The first principal vein runs up to three feet (or over) and is chiefly sulphurets, containing considerable galena. The sulphurets assay into the thousands. The other two principal veins are three feet each and are very rich (free gold). The remaining veins are about 8 or 10 inches and are rich. It is said that rock crushed from the small veins yielded \$100 per ton. Messrs. Mitchell & Davey have bonded the Hibbing mine, and have flattering prospects; the indications are good for this to be among the best of Soulsbyville mines. Further developments will be required before much can be said of its future. Mr. J. Johnson is sinking a shaft on the Fifth Ward mine; he has some very rich rock. The vein is small, but no doubt in sinking the vein will increase in size. The Louisiana mine is bonded and they will commence taking out the water as soon as rain comes to get water in the Soulsby Branch ditch to run the pumps, etc.

## NEVADA.

## Washoe District.

CON. CALIFORNIA AND VIRGINIA.—*Enterprise*, Nov. 13: On the 1300 level the drift started north from the station in the Consolidated Virginia shaft has been advanced 60 feet; total length 248 feet. The 1300 and 1400 levels still continue to yield good milling ore. On the 1435 level the drift running south from the north end of the mine has been advanced about 50 feet; total length, 310 feet. This drift has cut into good milling ore, which evidently extends from the ore development on the 1400 level. On the 1500 level the drift running north from the Con. Virginia shaft has been advanced 24 feet; total length, 89 feet. The drift running south from the Con. Virginia shaft, on the same level, has been extended a total distance from the shaft station about 305 feet. On the 1650 level good ore was struck the first part of the week, in a drift running easterly from the old stopes, at a point under the ore struck on the 1400 level. During the week about 8200 tons of ore were shipped to the Eureka and Morgan mills, the ore averaging a few dollars more in value than in the past week.

OPHIR.—The shaft station on the 1065 level has been completed.

UTAH.—The main drift started from the station in the shaft on the 472 level has been advanced 63 feet.

SIERRA NEVADA.—On the 520 level west crosscut No. 5 from the north lateral drift has been advanced 35 feet; total length, 138 feet.

MEXICAN.—Workings still confined to extending the joint Union Con. crosscut and the advance of the joint Union north drift on the 1300 level.

UNION CON.—On the 1300 level, the joint Mexican and Union drift, which was started north from the station in the Ophir shaft, has been advanced 36 feet; total length, 99 feet.

OCCIDENTAL.—The upraise from the lower tunnel, owing to the hardness of the rock, has been advanced but nine feet; total length, 59 feet. About 10 tons of ore have been extracted from the upper tunnel.

CHOLLAR.—Work has been resumed through the main tunnel, on the 250 level, but only a small number of miners are, at present, employed. From the 250 level down will be reopened through the old Chollar shaft.

HALE AND NORCROSS.—The machinery is now in good shape for running. The shaft has been repaired down to the 1300 level, and the incline from the 1300 level to the 1700 level is being repaired. Work will soon be actively resumed from the 800 to the 1700 level.

GOULD AND CURRY.—On the 425 level the main west drift from the station has been reopened and retimbered a total distance of over 420 feet. The south drift from this main west drift has been reopened and retimbered a distance of 49 feet; total distance, 153 feet.

SAVAGE.—The south lateral drift on the 500 level has been advanced 40 feet and is now out about 100 feet south of the north line. On the 600 level it now lacks but 100 feet of connecting with the old Savage shaft. On the 800 level they are now out about 250 feet south of the north line. The ground on these levels is being stripped preparatory to crosscutting, which will be commenced in a few days.

BEST AND BELCHER.—On the 600 level, east crosscut No. 1 has been advanced 47 feet; total length, 548 feet. At a point in this east crosscut No. 1, 486 feet from the north lateral drift, a drift started due east has been advanced 21 feet; total length, 128 feet. The flow of water, which at first bothered them, has been stopped and work resumed with the above result. The old north lateral drift on the 800 level has been retimbered and reopened during the week 50 feet, making the total distance of reopening and retimbering 595 feet.

BULLION.—They are preparing and making arrangements to erect hoisting works at the Croesus shaft, which is situated at the north end of the Bullion ground. The objective point in sinking will be the 300 level, which will be thoroughly prospected for the ore which is known to exist all the way from the 300 to the 600 level of the Croesus shaft. Work will actively commence about Dec. 1st. In Gold Hill the usual amount of prospecting is being done, and the usual amount of ore extracted in the different mines. The Carson river has a full head of water, which will continue throughout the winter and summer, enabling the mills to run full-handed.

## Columbus District.

CANDELARIA.—*True Fissure*, Nov. 13: The mill will resume operations next Monday morning on Georgene ore. Additional flues have been put in and the mill otherwise overhauled and repaired. The machinery for the Georgene hoisting works is daily expected. In the meantime the shaft has been sunk about 125 feet with a windlass. The shaft is a double compartment and is 11x6 feet. Under the foremanship of Thomas Curlett, it has been sunk

faster, considering the means, than any shaft ever put down in the district. There are 33 men at work in the mine.

TILDEN.—There is quite a pile of rock on the dump, and about three tons of assorted ore, which assays very high, will be put through the Fleming mill as soon as a cleanup is made from the Overland run.

OVERLAND.—Fleming's mill, Columbus, started up last Thursday on a small test run from this mine. The ore is very good and the result is hopefully looked forward to.

## Eureka District.

ORE SHIPMENTS.—*Eureka Sentinel*, Nov. 13: During the past week ore shipments were made from the mines of the district to the two reduction works in town as follows: To the Richmond Works—Silver Lick mine, 17 tons; Dunderberg, 123; Plute, 10; White Pine, 3; Bay State, 20; Geddes and Bertrand, 7; Seventy-six, 16. To the Eureka Con. Works—Jackson mine, 10 tons; Bay State, 4; Diamond, 25; Marguerita, 7; Featherstone, 16; Wood-chopper, 5; Altoona, 10; Watson, 3½; Barton, 6; Fairbanks, 15½; Norris, ½; Wide West, 5; Schenck, 8.

ANOTHER DIVIDEND.—The four owners of the Silver Connor mine declared another dividend yesterday of \$1500, or \$375 each. The ore in this property shows no signs of exhaustion, and the present production is liable to continue for many months yet from the body which supplies the shipments now being made. A portion of the ore shipped during the past month worked \$100 in gold to the ton. What the owners term second-class ore went \$50 in gold.

## Gillis Mountain District.

QUIET.—*Cor. Virginia Enterprise*, Nov. 13: Four men and one old tomcat comprise the full active working force of the district. The writer is busily engaged in the development of a series of ten select claims, designed on merit, for a syndicate capital. The annual assessment work on these claims for the year 1886 is now completed. The Hidden Treasure mine (my nearest neighbor), an ore-producing claim, has been closed down for the past two months on account of the low price of silver. The Burnley mine is now being worked, and producing ore equal in richness to its original standard. A recent shipment gave returns for first-class \$1000, for second-class \$400 per ton. Any district producing ore of this character ought to be entitled to some consideration. I am informed by one of the owners that one-third of the claim has been sold to a man of means, and that the work of development will now be vigorously prosecuted in a systematic manner. There are many idle claims in this district, some on account of the low price of silver, others for want of capital. With the price of silver at its original and just standard, the mining industry of this section would take new and active life.

## Mount Rose District.

PARADISE VALLEY.—*Silver State*, Nov. 15: Milling ore produced, 157 tons, 530 pounds; shipping ore, 12 tons, 1036 pounds. Average assay value, per ton, 86.25 oz. silver; 0.45 oz. gold. Concentrations produced, 340 sacks, 27,255 pounds, par value, \$6735.52; shipping ore, 184 sacks, 25,036 pounds, estimated value \$2503.60; total, \$9239.12. Mill work—Three Huntington centrifugal roller mills; six Triumph concentrators. Mill run 166 hours; worked 104 tons. Number of men on payroll, 121. We will resume sinking the engine shaft on receipt of supplies, soon to arrive, and continue to the 250 level which we will crosscut first, as our prospects should be more favorable at that point. No. 4 tunnel-face shows some change with more favorable indications. The Wild Goose drift from No. 4 tunnel gives indications of nearing the vein. Everything running smoothly in and about the mill and mine.

## Ophir Canyon District.

BULLION SHIPMENTS.—*Belmont Courier*, Nov. 13: The Chicago Mining and Reduction Company continues to make regular bullion shipments from Ophir canyon. Their mine is looking well and producing sufficient ore to keep the mill running steadily.

## Silver Peak District.

SALE.—*Candelaria True Fissure*, Nov. 13: The long-contemplated sale of a large group of mines in this district has at last been consummated, a syndicate of English capitalists being the purchaser. The group comprises 17 patented mines and others unpatented. It is expected that work will be begun at once. This is the most cheering news that Southern Esmeralda has heard for many days. This county will yet show to the world that it is the richest mineral-bearing section in the country.

## ARIZONA.

NOTES.—*Prescott Courier*, Nov. 9: Milling and concentrating are the processes that will free the precious metals from most ores of this section. Mr. Riley, lessee of the Nevada mine, Groom Creek district, is stopping down ton after ton of rich gold rock. Clark and Adams are going to put up and run a Huntington mill, in connection with their sawmill, on Groom creek. A big bar of silver bullion, from the Peck mill, was brought in Tuesday evening by Shull & Austin's stage. Wm. R. Morgan is in Humboldt district and says, in a letter to us, that he likes it and will pass the winter there. He had already struck one good prospect. Aleck Harris is visiting his mine near Cienega. Bob Dougherty will do some prospecting in the Bradshaw mountains. His latest work was done in Calico, California. He thinks this portion of Arizona is a better country than he has seen for many years past.

ORE.—*Mohave Miner*, Nov. 14: J. J. Goshorn shipped a carload of ore from the Altata mine last week, which is expected to run over \$200 per ton. Messrs. Tourtellotte and Leffler recently had 18 tons of gold ore from the Vanderbilt and Wyoming mines worked at the Mineral Park mill. The cleanup gave them a handsome bar of bullion worth \$1165. The boys are much elated over the result. Messrs. Christie and Dunn, of the Rural mine, will ship a carload of ore to the Selby Smelting Works at San Francisco in a few days. The ore is expected, so Mr. Christie tells us, to run about \$2000 per ton, and will be by far the most valuable shipment ever made from this county. We hear that Messrs. Johnson and Clack, of the C. O. D. mine, near

Stockton, have sold that claim to Messrs. Howell and Dana, the well-known mining men, who are now operating on the Prince George mine at Stockton Hill. The exact consideration is not known, but is supposed to be in the neighborhood of \$20,000. Every one who is interested in mining in this district will be pleased to hear that Johnny Mackenzie has leased the Cupel mine at Stockton Hill for a long term, and will at once proceed to erect steam hoisting works and make many other much needed improvements on that valuable property. We wish Johnny all the success in the world in his undertaking. It is rumored that the old Moss mine, in the San Francisco district, has been bonded to C. B. Dahlgren, of Brooklyn, N. Y., for the sum of \$50,000, the real purchaser for whom Mr. Dahlgren is acting being a company of wealthy English capitalists. This mine is owned by Messrs. Kuencer, Curtis, Wright and Zimmer. Mr. Curtis is now in London negotiating for the sale of other properties in this county to the same company.

## COLORADO.

IRWIN.—*Elk Mountain Pilot*, Nov. 11: The Bullion King is taking out some good ore now, and Supt. Repell is correspondingly happy. This mine is being worked in the most systematic manner of any mine in the county. Contractor Coleman has finished his contract on the shaft and crosscuts. Supt. Chas. Krueger is taking some very rich ore out of the claims of the Gunnison Mining and Milling Co., on Ruby Hill. The pay streak is not very large, but the ore is solid and very rich, and as depth is gained they are bound to come to the front as producers. Nelse Bergh is working a new discovery just south of the Little Crown shaft-house, and at the depth of 12 feet has a very rich streak of ore about four inches wide that will mill away up, and is improving as depth is gained upon it. The Gunnison Mining and Milling Co. have for some time past been at work on the Yellow Jacket lode, a sister claim to the Fairview. The title is in dispute, the owners of the Fairview, who were the original owners, claiming to have done their annual work, while those who are now in possession claim they did not.

## IDAHO.

OVER \$100,000!—*Wood River Times*, Nov. 10: The Minnie Moore is proving to be a wonderful mine, indeed. Although scarcely prospected, it already shows ore that will yield a net profit of over \$1,000,000, and its monthly shipments already exceed \$100,000. During the month of October last this mine yielded (and shipped) 106½ tons of ore, which sold for \$136,683.19. This ore, after paying for sampling, smelting and freight, yielded a net profit of over \$100,000. This is a really wonderful showing, and the managers and owners of the Minnie have the satisfaction of knowing that this property, last month, shipped more than double the amount of ore of any other mine in Idaho. The Idahoan, which has been the banner mine of Wood River for a long time, will have to yield that title to the Minnie Moore.

THE QUEEN AND KING OF THE HILLS.—Chas. Popper, principal owner of the Queen of the Hills group of mines, near Bellevue, and of the King of the Hills group, near Bullion, is in from New York City to make an examination of his properties before winter sets in. He says that the Queen is doing finely and yielding satisfactorily, and that she will doubtless continue to do so for some time, anyway. The King of the Hills is also showing considerable ore, and proving an excellent property under Superintendent Gibbons' management, but Mr. Popper says that he does not care to extract ore in any quantity at present. Next spring, however, he may do differently. Until then he proposes to employ 8 to 12 men, but to keep them on development work.

BOISE NOTES.—*Statesman*, Nov. 13: The El-mira mine, at Banner, continues to yield handsome returns to its owners. Almost every week a consignment of bullion is sent down to the express office at Idaho City. The Forest King mine, owned by the Moriarity boys, near Idaho City, Boise county, continues to show up well and yield to her determined and persistent owners a fair return. The mine is not yet developed, but the boys have gotten beyond doing all dead-work and are getting some pay. Geo. Riebold crushed recently 4200 pounds of rock from the Little Giant mine in Warrens, and the resulting amalgam realized \$2100, gold, an average of 50 cents a pound. There is probably not another mine in America which yields such uniformly rich rock as that same Little Giant. Owyhee county is rapidly coming to the front as a mining county and is assuming some of her old-time importance and activity in that line. A number of mines on War Eagle mountain, and at Filat and Wagontown, are being very successfully worked and are paying good returns to the owners. It will not be at all surprising if inside the next two or three years Silver City once more becomes a prosperous mining town. At the rate of advance Idaho has made this year in its production of precious metals it will not be many years until it is well up in the front among the largest producers of gold and silver and will rank with California, Montana and Colorado. Eight of the 14 counties have permanent and prosperous mining camps, and new and rich discoveries are constantly being made and new mines opened up, and the Territory is not half prospected. That rich gold deposits lie buried in the hills north and east of this city is demonstrated in the discovery of the Boise Black Rock lode within five miles of the city. This ground has been prospected over for years, but no one seems to have hit upon the right spot until Staggs & Mutter made their recent discovery. Nor is it reasonable to suppose that they have discovered the only lode. The fact that a recent assay of their ore run over \$6000 to the ton will doubtless stimulate others to continue the search in the same locality.

## MONTANA.

THE EMPIRE AND ITS OUTPUT.—*Helena Independent*, Nov. 11: During the month of October the Empire 10-stamp mill run 27 days, crushed 437 tons of ore, yielding \$14,500, or an average saving of over \$33 per ton. The mine shows material improvement during the month, particularly in the tunnel level and in the 500-foot levels, both east and west.

THE DRUM LUMMON OUTPUT.—During the

month of October the Montana Co. (limited), with 60 stamps in 27 days, crushed 3133 tons of ore and cleaned up \$137,400. The saving averages nearly \$44 per ton. The new 60-stamp mill is now about complete, and Mr. Bayliss, the managing director, expects that its stamps will begin dropping next week. In all its appointments this mill will be the most complete as well as one of the very largest in Montana.

A RICH SIGHT.—Yesterday the Merchants' National bank displayed on its counting tables a lot of gold dust just received, valued at \$12,000. It was mined by Whittier Bros., during the season just closed, in the Blackfoot district. One pan of the lot was composed entirely of very coarse gold, including many large nuggets, that had been cleaned up without quicksilver. The other was slightly amalgamated, but not enough to interfere with its inimitable color. The Merchants' National has in its vaults a peculiar nugget, taken out of Greenhorn gulch the past season. It is a thin, flat chunk of gold in the form of a curve, nearly six inches long and from one to two inches wide at different portions of its length. The miner in digging it up struck it with his pick and broke it in halves, but this will be repaired and the peculiar nugget will be added to the beautiful and valuable collection owned by the Merchants' National.

## NEW MEXICO.

SOCORRO.—*Bullion*, Nov. 13: Mudge & Zeigler are working their various claims in Water canyon. Robinson & Glasson are working their gold claim successfully in Garcia canyon, near the Ruby. Gen. Cook's Sulphuret, situated near the Ruby and Bonaparte, is shipping ore to Socorro. Major J. B. McGee got back from Kingston on Sunday. He reports a big strike in the Calamity. Prospector Kelly is delving in his Bonanza, and preparing to pack ore on burros from the summit of the Magdalenas. Leddy & McLeish, in their 55-foot tunnel in the Bonaparte mine near the Ruby, have intersected a 3-foot vein of rich lead carbonate ore. Mike Wallace, one of our best miners, has returned from Kingston. He is now working his Georgia Bell and Iron mines in Water canyon. Shands & Co. and T. Leeson, of the St. Vincent mine, let a contract on Wednesday, to A. R. Bryson, for 50 feet of additional work in that property. Bumbaugh & Peterson continue operations on their gold claim in the Socorro mountains. They have performed to date 790 feet underground work. The Ruby mine is being worked without intermission. At 50 feet in the main tunnel a full face of mineral meats the eye, in which free gold occurs from time to time. Superintendent Bates, of the Imperial mine, is in the city. He reports work on that property advancing in a promising manner, and that he will shortly ship mineral to Socorro for treatment. Stack No. 3 at the Billing works blew in on Monday last. The works are now running in full blast, operating all three of their stacks and the roaster for the first time in several months, and we take it as a good omen for the future.

## UTAH.

THE PARLEY'S PARK.—For the last two years or more, everything around the old Parley's Park property has been as quiet as death. Early this week J. G. Kennedy, the old superintendent of the company's affairs, who lately arrived from New York, began making arrangements to get up steam and go down the shaft on a tour of inspection. On Thursday the steam whistle sounded and some of the machinery grated with rust. However, the trip was made to the 700 level in a way that reminded Superintendent Kennedy of old times. The shaft was found in a dry and first-class condition, considering everything. No doubt the mine is drained by the Ontario. After Mr. Kennedy has made a thorough inspection of the property a report will be made to the millionaire stockholders, mainly those composing the Standard Oil Co., and if acted on favorably work will begin at once.

ORE AND BULLION SHIPMENTS.—During the week the Crescent shipped 148,283 pounds of concentrates and 154,912 pounds of first-class ore. For the week ending yesterday the Mackintosh sampler received 424,740 pounds of Ontario ore; 9250 pounds of Daly, and 10,750 pounds of Sampson ore; total 444,740 pounds. The output of Daly bullion from the Marsac mill for the week was six bars, containing 5776 fine ounces of silver. The Ontario bullion shipment on the 1st inst. was 29 bars, containing 16,920 fine silver ounces, and yesterday the product was 28 bars, containing 14,746 fine ounces of silver.

REVIEW.—*Salt Lake Tribune*, Nov. 12: The week has been stormy and unfavorable to the movement of the metals. Miners in various regions beginning to come out of the hills. Prospecting and original developments are practically over for the season. Of course such mines as are established producers are not referred to in this statement. The receipts in this city for the week ending November 10th, inclusive, were \$71,054.16 in bullion and \$55,226.57 in ore; a total of \$126,280.73. For the previous week the receipts were \$119,409.05, of which \$65,973.41 was bullion and \$53,435.65 was ore. The output of the Ontario for the week was 16,385.02 fine ounces and \$9143.66 from ore sales; a total, approximately, of \$25,528.68. The Daly product for the week was 13 bars of fine bullion, 16,960.68 ounces; ore sales, \$7923.01; an approximate total of \$24,883.69. The continued silver shipments from the Bannock, at Era, Idaho, stock of which is mostly owned in this city, were a feature of the week. Three silver bricks were received—1626, 1697 and 1664 ounces respectively, 975 to 980 fine, with \$1 in gold to each ounce of silver. The value of the bars was placed at \$6500. Fine bar receipts for the week were of the value of \$21,081.16; base bullion, \$13,200. The Hanauer smelter produced during the week \$25,063 in bullion. The Stormont sent up on the 4th and 6th silver bars to the value of \$5210. Ore receipts were \$14,506 by Wells, Fargo & Co.; \$37,520 by McCormick & Co., including \$6700 from the Crescent, \$2090 from the Queen of the Hills, and \$1180 from the Overland, and \$3200.57 by T. R. Jones & Co.

STAR.—*Cor. Salt Lake Tribune*, Nov. 5: Star district is not wholly deserted, and work continues on most of the old claims. The mammoth mine has been leased to Mike Monahan. He has now a force of six miners. Work continues on the Adelia, Florence, Rebel, Blue Cloud, Chicago, Rose Cleveland, Jim Keene and many others.

# JAMES' PATENT RECIPROCATING STAMP MILL.

(PATENTED AUG. 16, 1881.)

Weight of Boss and Shoes (1200 pounds) acts on each Shoe separately. It is practically the same as the regular Stamp Mill.

Capacity, 6 Tons in 24 Hours. 4 H. P.

Parties wishing to test the Mill with any ore they may bring, will find one in operation at our works in this city.

## PRICES:

Reciprocating Stamp Mill,	\$350 00
Rock Breaker, - - -	100 00
Automatic Ore Feeder, -	50 00
Single Track Ore Car, - -	40 00

SEND FOR CIRCULAR.

TATUM & BOWEN,

34 & 36 Fremont St., San Francisco.

91 & 93 Front St., Portland, Oregon.

## IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.

E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.  
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.  
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,

SHEET LEAD,  
SHOT, Etc., Etc.

ALSO MANUFACTURERS OF

Standard Shot-Gun Cartridges,  
Under Chamberlin Patent.

## JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE  
AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG  
GISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

## Nevada Metallurgical Works.

## Mining Share Market.

There has been no such boom in mining stocks for some years as is now prevalent. The whole list has been subject to sharp advances in price. During the last month some few have gone up from less than \$1 to \$25; others from 20 cents to \$10. The lucky buyers at low prices have realized largely. The volume of sales has increased ten-fold, and brokers are once more reaping commissions in a way that reminds them of bonanza days. Around the stock boards the excitement among the dealers is as great as in the times when prices were in the hundreds. It is all supposed to be due to the fact that the lower levels of the Comstock have been abandoned; that work will be confined to the old upper levels, and that bullion shipments from there are on the increase. No special developments in ore have brought about the excitement. The Virginia Enterprise, in speaking of the Comstock mines, says: Nothing out of the general order of things has occurred in the several ore-producing mines during the past week. The center of attraction, Con. California and Virginia, has not increased its output of ore, as it is impossible for the mills to handle more than they are now receiving. The battery assays for the past week show an increase over the previous week of about \$4 per ton. There are mountains of ore ahead, and could the ore houses and mills receive it, more men would be put to work and larger quantities of ore extracted.

The managers of the Savage Mining Company are preparing to crosscut on the 600 and 800 levels, and before the beginning of the new year, the work of extracting the ore, which has been found on these levels, will begin.

The Bullion managers are also actively engaged in setting up machinery, etc., and will erect hoisting works at the old Croesus shaft, after which the shaft will be repaired and vigorous prospecting done in quest of the ore which they say exists on the 300 level near the Croesus shaft and which will mill from \$15 upward.

There has been in the past two weeks in the neighborhood of \$150,000 in bullion shipped below from the Con. California and Virginia. With the indebtedness entirely wiped out, and this amount lately shipped, the stockholders will doubtless soon receive their first dividend.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

TRINITY RIVER TUNNEL AND M. CO., Nov. 16. Capital stock, \$500,000 in 50,000 shares. Directors, W. H. Lawrence, Calixte Denervand, Charles W. Randall and J. Henry Meyer.

AMADOR G. M. CO., Nov. 16. Capital stock, \$400,000 in 200,000 shares. Directors, Martin Jones, W. B. Murdoch, W. E. Adams, Samuel L. Theller and Nathan Atkinson.

MURRIETA AND SAN JUANITO R. R. CO., Nov. 13. Location, San Diego Co. Capital stock, \$240,000. Directors, F. E. Bates, G. Preterbaugh, S. A. Compton and C. L. Morrill.

WESTERN FIBER CO., Nov. 13. Object, to engage in buying and selling patents and patent rights for decorating fibrous materials. Capital stock, \$2,000,000. Directors, E. W. Newhall, George K. Porter, R. H. Lloyd, A. W. Foster, E. Scott, George C. Hickox and Walter S. Maxwell.

SEBASTOPOL G. M. CO., Nov. 10. Capital stock, \$1,000,000. Directors, W. Letts Oliver, F. J. Fleiter, Geo. West, E. Baldwin, A. S. Cheminant.

SHOALWATER BAY MILLING CO., Nov. 10. Object, to carry on a lumber and milling business. Capital stock, \$150,000. Directors, O. Preston, J. J. McKinnon, J. J. Coleman, W. R. McCullough, D. C. Hodgkin.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Alice, Nov. 13, \$22,908; Moulton, 13, \$12,800; Con. Virginia and California, 16, \$76,011; Hanauer, 12, \$2330; Crescent, 12, \$2520; Queen of the Hills, 12, \$1070; Hanauer, 13, \$6733; Bannock, 13, \$4750; Alice, 10, \$57,450; Hanauer, 9, \$6670; Queen of the Hills, 9, \$1020; Bannock, 9, \$6500; Hanauer, 10, \$4425; Queen of the Hills, 14, \$1040; Hanauer, 14, \$2270; Bannock, 14, \$1856; Con. Virginia and California, 13, \$38,786.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.  
G. W. INGALLS—Arizona.  
E. L. RICHARDS—San Diego Co.  
G. R. HUSTON—Montana.  
GEO. McDOWELL—Fresno and Tulare Cos.  
J. H. SMITH—Plumas and Sierra Cos.  
J. C. SWENNEY—Sonoma and Mendocino Cos.  
O. F. BERGMAN—Yolo and Solano Cos.  
M. S. PRIME—El Dorado and Placer Cos.

SILVER is "selling at one dollar an ounce, and is evidently on the up grade to stay. A revival in mining is sure to follow an increase in the price of silver, and then the mines of Nye county will be worked for what is in them.—Silver State.

## MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

## Thanksgiving Proclamation.

STATE OF CALIFORNIA,  
EXECUTIVE DEPARTMENT.

In accordance with the custom and in conformity to the proclamation of the President of the United States, I, George Stoneman, Governor of the State of California, do hereby designate and set apart Thursday, the 25th day of November, as a day of thanksgiving and prayer. I invite the people of the State to forego their usual business employment and assemble in their places of worship to give thanks to the Supreme Ruler of the universe for the continued enjoyment of the blessings of free government, for the renewal of business prosperity throughout the land, for the return which has rewarded the labor of those who till the soil, and for our progress as a people in all that makes a nation great. Let us, in the midst of thanksgiving, remember to dispense charity liberally to the poor and needy, so that our services may, by such acts, be made acceptable to God.

In testimony whereof I have hereunto set my hand and caused the great seal of this State to be affixed, at the State Capitol, on this the 10th day of November, A. D. 1886.

GEORGE STONEMAN, Governor.  
Attest: THOMAS L. THOMPSON,  
Secretary of State.

## New York Metal Market.

Telegraphic advices dated Nov. 18th give the following New York prices:

BORAX—5 1/2 @ 6 1/2.  
BAR SILVER—101 1/2 per oz.  
COPPER—LAKE—12.00.  
IRON—No. 1, \$18 @ 19.00.  
LEAD—\$4.85 @ 4.95.  
QUICKSILVER—53 1/2 @ 55c.  
The following is the latest by mail from the "New York Metal Exchange Market Report":  
COPPER—Lively, spot closing @ 11.85 @ 12.10.  
Transferable Notices (Lake) issued at 11.95.  
Transferable Notices (Chili Bars) issued at 4.41.65.  
LEAD—Stronger at 4.42 1/2 @ 4.50c spot. Transferable Notices issued at 4.47 1/2.  
TIN—Quiet at 22.15 @ 22.20. Transferable Notices issued at 22.20.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$22.30 @ 22.50; Billiton Tin, \$22.75 @ 23.10; Banca Tin, \$23.00 @ 23.50; Baltimore Copper, \$10.55 @ 10.95; Orford Copper, \$10.50 @ 11.00; P. S. C. Copper, \$10.25 @ 11.00; Foreign Lead, \$4.50 @ 4.75; Foreign Spelter, \$4.35 @ 4.75.  
MAKER'S PRICES—At tidewater, 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$18.50 @ 19.50; No. 2, \$17.50 @ 18.50; Grey Forge, \$16.00 @ 16.50. Hudson River, Grade No. 1, \$18 @ 19.50; No. 2, \$17.50 @ 18.00; Grey Forge \$15.50 @ 16.50. Southern, Grade No. 1, \$18.00 @ 19.00; No. 2, \$17.00 @ 18.00; Grey Forge \$15 @ 16.

THE Etna Quicksilver Mining Company, of Napa county, has declared a dividend amounting to \$10,000.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING NOVEMBER 9, 1886.

352,385.—ROAD ENGINE—W. Applegarth, Fresno, Cal.  
352,181.—WINDOW—M. B. Burk, Dayton, W. T.  
352,182.—IRONING BOARD—L. M. Darrow, Stockton, Cal.  
352,482.—OPERATING VALVES OF HYDRAULIC ENGINES—Jos. Moore, S. F.  
352,483.—TRACTION WHEEL—R. R. Moore, Modesto, Cal.  
352,346.—SELF-PROPELLING WAGON-TRAIN—J. B. Osborne, Daggett, Cal.  
352,260.—WRENCH—J. M. & W. H. Parsons, Great Western Mine, Cal.  
352,278.—LINIMENT—O. W. Storer, Snelling, Cal.  
352,282.—FUMIGATOR—Jos. Watson, Petaluma, Cal.  
16,979.—DESIGN—F. S. Johnson, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

## Assessment Notices.

**Tallulah Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Sierra Mining District, Humboldt County, Nevada.

NOTICE is hereby given, that at a meeting of the Directors, held on the 30th day of October, 1886, an assessment (No. 21) of thirty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 634 Market street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 8th day of December, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Wednesday, the 29th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEORGE A. HILL, Secretary.

OFFICE—With Estate of Samuel Hill, 634 Market St., San Francisco, Cal.

**Acme Mill and Mining Company.**—Location of principal place of business, San Francisco, Cal. Location of works, Volcano Mining District, Amador County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 25th day of October, 1886, an assessment (No. 9) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Sec'y.

OFFICE—Room 4, 309 California St., San Francisco, Cal.

**Aultman Mill and Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Georgetown Mining District, El Dorado County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 26th day of October, 1886, an assessment (No. 3) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Sec'y.

OFFICE—Room 4, 309 California St., San Francisco, Cal.

**Santa Annita Mill and Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Nevada County, Cal.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 26th day of October, 1886, an assessment (No. 10) of one and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Secretary.

**H.H.H. HORSE LINIMENT.**  
THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all Druggists.

## Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, \$3, coin, postage free. Sold by DEWEY & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F.

BACK FILES OF THE MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

## THE FRISBEE-LUCOP MILL,

## A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

## THE FRISBEE-LUCOP MILL CO.,

Office, 104 & 106 Washington St., NEW YORK.  
OR PACIFIC IRON WORKS, SAN FRANCISCO.

LIFE SCHOLARSHIP, - \$75.00  
Full Business Course.

SIX MONTHS' COMBINED COURSE, \$75.

Including the Business Course, Academic Course, Modern Languages, Telegraphy, Shorthand, Type-Writing, etc. Ladies admitted into all Departments. Day and Evening Sessions during the entire year.

CALL OR SEND FOR CIRCULARS.

Practical Treatise on Hydraulic Mining.  
By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by DEWEY & Co., Publishers, 252 Market St., San Francisco.

## Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

THE ORIGINAL  
**Roller Ore Feeder.**

This form of Ore Feeder is well adapted  
for its peculiar work.

In reference to a similar form of "Roller" Feeder, which is being manufactured and offered for sale in this city, and of which a cut appears in this journal, we have to say that the Superintendent of the Bunker Hill Gold Mining Company states that the "Challenge" is far superior to the "Roller," he having had both of them operating side by side. We shall be pleased to show this letter, upon application, to any one interested.

We are also manufacturers of the "Challenge" and "Stanford Improved."

Prices furnished by the  
**JOSHUA HENDY MACHINE WORKS,**  
39 to 51 Fremont St., San Francisco.

### ORE FEEDERS.

We direct attention to an advertisement, which appears in our journal, of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder, known as the "Templeton Roller," claim that it is superior to any other style, and cite those in operation at the "Bunker Hill" mill in Amador county, we expressly contradict the statement, and in substantiation submit a copy of a letter shown to us by a representative of the "Joshua Hendy Machine Works," which speaks for itself.

BUNKER HILL GOLD MINING CO.,  
AMADOR CO., CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ores to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will sluice right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly,

(Signed) N. W. CROCKER, Supt.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE "TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to  
JOSHUA HENDY MACHINE WORKS,  
39 to 51 Fremont St., San Francisco, Cal.

## IMPROVED HYDRAULIC MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

**MINING MACHINERY.**

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

### WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

### BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE OF CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

## A New Hydraulic Gravel Elevator.

Gravel elevators are used in this State in gravel mining operations, where there is no dump and the material has to be raised to secure the necessary dump. It must be elevated sufficiently to be thrown into the flume so as to pass off, otherwise the pit would become choked up with material. In fact, without these appliances, many pieces of ground could not be worked at all. This elevation of the gravel is usually done by a closed pipe, the upper end in communication with the main chute or flume, and the lower end with the pit or hole in the bed, into which the gravel is washed. A hydraulic nozzle connected with a branch pipe carries water under pressure into the lower end of the elevator, and the force of the stream is such that it carries the material behind it, on the principle of an injector, and carries it up through the pipe.

Lafayette and Wm. W. Eastlick, of Oro Fino, Siskiyou county, in this State, have just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a new form of gravel elevator, in which they do away with the tight-closed pipe and use an open-top chute, which is rendered effective as an elevator, both by reason of its construction and the arrangement of the hydraulic nozzle or nozzles in communication with the lower end, whereby the material which is fed to the chute is forced directly up by the stream, not by suction, as is the case with the closed pipe, but by direct impact.

The accompanying drawings show this invention. The elevator chute *A* is composed of two sides and a bottom, there being no top, so that the chute is open above. The interior walls, both of sides and bottom, are lined with separate heavy blocks, *a*, adapted to be removed and renewed. The chute is practically indestructible, a very desirable result, as it is subject to great wear and tear. The whole chute is properly braced to increase its strength. *B* is a nozzle let into the lower end of the chute through a cross-beam *b*, which serves as a rest for the feed-flume, as hereinafter described. The nozzle is on the end of the branch pipe *C*, communicating directly or indirectly with the elevated water source.

In some cases a second or supplementary nozzle, *D*, is connected with a second branch pipe, *E*. When this nozzle is used the floor or bottom of the chute is made higher or thicker at its lower portion, so that an offset, *a'*, is formed through which the nozzle enters, as shown in Fig. 1.

In Fig. 2, *F* is the bed; *G* is the feed-flume into which the material is washed. This flume rests within the lower end of the elevator chute *A*, and discharges its material therein immediately in front of the nozzle *B*. The main flume is shown at *H*.

The elevator chute is set at an elevation, say of 40 degrees, its lower end being in the bed, *F*, and its upper end arranged to discharge its contents either directly into the flume *H* or against a cut in the bank, *I*, from which it flows back again into the flume. The force of the stream from the nozzle, *B* (which in the practice of the inventor's is a three-inch one connected with a 15-inch branch pipe, *C*, the water being under a head of about 275 feet), is so great that the material fed from the flume, *G*, is forced directly by the impact of the stream up the elevator chute into the flume *H* or against the cut in the bank, *I*. This direct impact enables them to use the open-top

chute for an elevator instead of the closed pipe, being less costly and easier to repair.

If the elevation be too great for the effective operation of the single nozzle, *B*, they use the supplementary nozzle in connection with it, so

was appointed: John Oswald, M. McAvoy, Owen Pegg, John Holland and W. J. Moore.

ANOTHER PROCESS FAILURE.—The Truckee Republican reports that the works erected at

EASTLICK'S IMPROVED HYDRAULIC GRAVEL ELEVATOR.

that the material meets with a fresh impetus on its way up.

At a meeting of the Pacific Coast Association of Stationary Engineers, a discussion was had

the Meadow Lake mine this summer have proven a failure, so far as the "new process" is concerned. The new rotary ore crusher cannot stand the work and wears out too fast. The electric apparatus for separating the gold

as to the advisability of presenting a bill to the next Legislature for the passage of a law compelling boiler inspection, and an examination and licensing of engineers. For the purpose of drawing up such bill the following committee

was a failure, and that part of the process will be abandoned. The company, however, are not discouraged, but in the spring will put in stamps and try a method of concentration.

## Copper.

England controls the price of copper in the markets of the world, although her own mines in Cornwall do not produce much over 100 tons of this metal a month. The statistics prove that she does an immense trade in copper. For the first nine months of this year England imported 84,593 tons of copper (metal) and exported 44,488 tons. The British production is only 900 tons. The English home consumption was 33,294 tons; imports into France, 9339 tons; export of English copper to France, 5442 tons; French consumption of copper imported direct, 9677 tons; French consumption of English copper and of copper imported direct, 15,119 tons; English consumption and French consumption of copper imported direct and from England, 48,413 tons; English consumption, English exports and French consumption of copper imported direct, 87,459 tons.

Board of Trade returns and statistics kept by James Lewis & Son, Liverpool, segregate some of these figures. The imports of ore amounted (in tons of fine copper), in the first nine months of 1886, to 10,718, of which 5782 came from Chili and only 420 came from America. This shows we are working our ores at home more in this country than formerly. Last year in the same time we sent nearly four times as much ore. Of regulus, where Chili sent to England 10,718 tons, we sent from this country 10,246. Of bars and ingots, where Chili sent 18,583 tons, we sent 4424.

The apparent English consumption of foreign copper was 33,294 tons. The apparent French consumption was 15,119 tons, or not quite half that of England. The total consumption of the two great nations mentioned aggregated for the first nine months of this year 87,459 tons, as against 100,000 tons in the same time last year.

On the first of this month the total visible supply of copper was 63,127 tons, of which 54,495 tons were in Liverpool, Swansea and London, and some little in France.

Chili has shipped to Liverpool and Swansea in the first ten months of this year 23,914 tons, and America has sent 12,633. The American arrivals in England and France for the past ten months are 16,094 tons, fine, against 29,264 tons during the same period of last year, a decrease of 13,170 tons—or nearly half. Lewis & Son's circular states that an uneasy feeling was created in Liverpool by reports of the early starting of the Anaconda mine. It expresses the opinion that in view of the fact, that the plant of this mine has been extended and improved, and a decline in freights and wages is probable, the cost of production will be materially reduced in future. This prediction begins to look as if it was a good one, as the dispatches this week say that the Anaconda smelter will resume with a small force of men at a reduced scale of wages. The force will be increased as fast as men can be secured until the smelter is in full operation. The reduction of wages from the old scale is about 15 per cent. The smelter has been closed down about four months. If this statement be true, then the efforts to reduce wages have been successful, notwithstanding the refusal of the Knights of Labor to accede to the request to do so.

The Pacific Borax, Salt and Soda Company is shipping considerable salt to the Candelaria Water Works and Milling Company, of Nevada.

## CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

## Mining Matters in Southwestern Montana.

EDITORS PRESS:—A lively and general interest is now noticeable among mining men of all parts of the country, particularly Colorado, Montana, and sections that have heretofore been considered too isolated to command attention. These are now thronged with men who seem to be making the most thorough investigations, and the indications seem to be that next season will be the most important that Southwestern Montana has ever seen. A party of gentlemen from Leadville, Colorado, are now at Red Bluff examining for the third time the fine property of Messrs. Olds & Hickman—the Golconda—and it is understood that the transfer is about to be made. This property is extensively developed and in a condition to be made a very large ore producer at once. It is understood that extensive works will be erected for the treatment of the Golconda ores and such custom ores as the Red Bluff district produces. Shipments have been going forward from this district, and the results of their treatment are very satisfactory to prospectors and mine-owners, and have encouraged and stimulated mining very much. Ores on the dump in any accessible place in the district are as staple and salable as any other commodity. The ores of this district are very rich, though somewhat base, and have not been successfully treated by the old free-milling process. The Revenue Mining Company are now very active, and will soon have 10 stamps at work. This mine is a large producer, and the ores, while very rich, have not been successfully worked. Roasting machinery is now being added to the already ample plant of the company, and it is thought by well-advised persons their ores will now be treated more successfully. The ores from this mine come from an incline about 125 feet on the vein, at a perpendicular depth of 60 feet, up to which point no water has been encountered. A good body of ore has been opened up, sufficient at least to keep the present plant at work for some time to come. Much activity is displayed by mine-owners, owing mostly to the success met with the past year in the shipment of the high-grade ores East, for which good prices have been realized.

Very little deep mining has been done in any of these districts. The owners of the Pilgrim mine, in the Cherry creek, or Havana district, have perhaps displayed more real grit and nerve, and developed better staying qualities, than any other company in Southwestern Montana. Work was begun on this property in August, 1885, and has been prosecuted quite vigorously ever since. The prospect was most encouraging from the start, and a new vein of very rich ore struck near the surface. Water, however, was encountered at a depth of 40 feet, and has been a source of great annoyance ever since, though work has progressed and ore been extracted during the entire period. From surface indications it was believed from the start that three veins ran through this property. The main shaft was sunk to a depth of 116 feet, the hoisting done by horse-power, and the water raised with large iron buckets. For the purpose of prospecting for other veins, a drift was started south, 100 feet below the surface, which has been continued a distance of 83 feet, at which point an immense vein of talc and quartz was lately struck, and the crosscut continued through this vein matter 33 feet, and the south wall has not been reached. Much of the quartz is very rich, showing free gold and silver. From the talc, or clay, your correspondent found free gold. We had some difficulty in getting into the mine for the purpose of examination, owing to the absence of the superintendent.

A careful examination of this great vein leads us to believe that it will develop into one of the greatest properties in Montana. The formation is granite and porphyry. The company, we understand, are about to place in position a very large hoisting plant, with pumping machinery of large capacity, and will at once sink to a depth of 300 feet and again crosscut. The further development of this property will be watched with great interest. While they now have abundance of ore it is understood that no move will be made toward the erection of reduction works until the mine has been thoroughly prospected to a depth of at least 300 feet, and the character of the ores in all of the veins is thoroughly understood. This property is owned by the Bozeman Gold and Silver Mining Company.

The attention of the large copper producers of Butte has been attracted toward the extensive group of mining districts lying in what is known as Southwestern Montana, and heavy mining men are considering and advising as to the best and most practicable way to reach these fine districts with a railroad from Butte, that these rich silver ores may be secured and mixed with the low-grade copper ores of Butte, which already contain a few ounces of silver to the ton, but not enough to pay to separate. The mixing of these ores would enrich the Butte ores, and make it profitable to separate the silver from the copper, and the silver which the copper ores contain would thereby be saved. By this method of treatment better profits

would be realized, and with the present prospect of reaching the coal fields of the Yellowstone valley, with better railroad facilities, thus securing cheaper fuel for Butte, and make it possible and practicable to work the lowest grade ores, the great silver city would soon double her reduction facilities and also double her already marvelous output, and largely increase the number of dividend-paying mines. The following, clipped from the Helena Independent, shows the

DIVIDENDS PAID BY MONTANA MINING COMPANIES SINCE JANUARY 1ST, 1886:	
Alice.....	\$ 75,000
Amy and Silversmith.....	136,608
Boston and Montana.....	180,000
Elkhorn.....	50,000
Granite.....	820,000
Hecla.....	150,000
Helena.....	59,670
Montana.....	448,800
Moulton.....	60,000
Total.....	\$1,980,078

This, in our opinion, will be largely increased before the end of the coming year. More California mining men are needed in this great Territory to develop its great mining wealth and profit by its marvelous richness. More improved California machinery is needed to work the baser ores of Montana's numerous mining districts. OBSERVER.

Red Bluff, Nov. 8, 1886.

## Cheap Gold and Silver Mills.

EDITORS PRESS:—As a subscriber to your paper I would like to ask you to give a certain class of your readers some articles describing and illustrating cheap gold and silver mills. In other words "portable mills," small outfits that can be cheaply taken to regions where such machinery would be in great demand if the miner knew what he wanted and where to get it.

Any man can build a mill with \$100,000, but it is the men who have to rustle to raise say \$2000 to \$3000, that need the portable mills, and a man with that amount as his "pile" doesn't want to fool it away on an experiment of some manufacturer.

If one will look at the success of the portable sawmill machinery, and compare it with that of mining, he will wonder that some manufacturer does not enter the specialty business. Griffith & Wedge, of Zanesville, Ohio, for instance, have an enviable reputation as manufacturers of the portable sawmill machinery class; so do many others, but G & W., also make mining machinery, but nobody hears of their "portable" stamps, or a "portable" crusher, etc.

One or two concerns at Chicago make a portable battery, but they are too flimsy for any use.

The small operator looks at all these things and then, out of desperation, flies to the new-process man, and gets left—always does—but that does not deter the next "rustler" from following his footsteps.

What is wanted by the most of "camps" and the most of the would-be mill enterprises, are small, well-built, cheaply-run, easily moved portable mills, having ample power, and built in such a manner that they can be run by men who are not thorough machinists—that will stand abuse like a mule, and yet do good work. It won't do to put a Corliss engine on the boiler, nor try to run a 20-horse power engine with a 10-horse power boiler. But if the manufacturers of mining machinery will copy the success of the portable sawmill machinery, they will enlarge their business, and help out a large class of men who haven't got their millions yet, but who have got a few thousand dollars and can't afford to fool it away.

Fort Maginnis, Montana, Nov. 13, 1886.

[THE MINING AND SCIENTIFIC PRESS has paid more attention to the subject of small mills and crushing appliances than any paper on the continent. We fully realize the situation described by our correspondent, and have repeatedly urged upon manufacturers the necessity of supplying this demand. Every time a new mill is devised we are careful to obtain accurate descriptions and illustrations so that miners can understand the appliance. Within the past month we have illustrated and described two—the James Reciprocating Mill, Oct. 30th, page 277, and the National Rocker Mill, Nov. 13, page 309. Our correspondent can rest assured that we shall continue to pay close attention to the subject.—Eds. PRESS.]

JUDGE BEACH, of the Supreme Court of New York, has dismissed the suit of the Stormont Silver Mining Company against Rufus P. Lincoln. The Stormont Company obtained judgment against the Hite Gold Quartz Company on one note for \$749,874.15, made in February, 1883. It was charged in the complaint that the Hite Company capital stock of \$2,000,000 had never been paid, and that Lincoln, who signed certificate, was guilty of bad faith.

THE Mountain Messenger states that the Rainbow mine has closed down, and that "lack of pay ore was the cause." It is very seldom any such reason is given for closing down a mine, though it is nearly always the true one.

## The Mines of Butte.

## Production of the Big Montana Camp.

The mines of Butte are making a great record for the richness and amount of their product. There are no properties of the phenomenal order in the district, says the *Inter-Mountain*, like the Granite mountain, but there are some equally as valuable, and being stronger and wider and more reliably productive, they are safer for investment than any other mines in the world. The Alice and Moulton are producing great quantities of bullion. The former never shipped so much in one month as it has done in the last, and the latter has never worked a more uniformly high grade of ore. The Lexington is once more big with probabilities. The rich chute of high-grade copper-silver ore on the 800-foot level has greatly stimulated development from the 1000-foot station east, and the workmen are already in the vicinity of its continuation. Should it open up according to promise and precedent, the Lexington will again come to the front as a dividend-payer. The mill is running admirably and giving splendid results on company and custom ore. The Bluebird is probably the most valuable as it is the most extensive silver property in Montana, and when the mill shall start up we expect it will contribute to the bullion product of the camp between \$80,000 and \$100,000 per month. Now that the mine has been systematically opened, and the mill constructed on a liberal and scientific plan, the mine being "proved" before the mill investment was made, Mr. Van Zandt, president of the company, under whose close practical supervision the work has been conducted, will go to England for a time, and Mr. Booraem, an experienced mining man, who has for seven or eight years past had charge of the Morning and Evening Star mines at Leadville, has been engaged as general manager, and the real work of producing money will begin under most flattering auspices in a few days. The starting up of the Bluebird mill will mark an era in the growth of the great camp of Butte.

Among the lesser silver properties everything is booming and prosperous. The rise in silver has infused new hope and new energy, evidence of which is everywhere visible, and a number of rich strikes and heavy ore shipments are reported. On the Narrow Gauge, in Deadwood gulch, some very high-grade ore has been struck during the week, first class assaying \$475, second class, \$200, and third class, \$70. There is plenty of it, and Dr. Musigbrod, one of the owners, foresees a great future for the property, as the ledge is strong and regular. The Narrow Gauge is now under lease. The Clear Grit is also to the front with some high-grade quartz, and considerable shipments of ore assaying from \$500 to \$1000 per ton have recently been made. On the Mountain Chief (west), Hamilton & Co. are pushing explorations with splendid results. They are extracting daily 40 tons of ore which is being concentrated at the Liquidator Works to 35 per cent copper and \$30 in silver, the product being shipped to the Butte Reduction Works. The first-class ore (of which a 20-ton lot was shipped yesterday) nets the company a little more than \$100 per ton. On the Josephine, Mr. Grimes is working on a fine ore body, from which he is extracting and shipping to the Lexington. The Elm Orlu maintains its splendid record as a producer, and is yielding 40 tons of good ore per day. The Amy and Silversmith is not making much noise, nor producing a great deal of ore; but it is looking well and paying a profit. The first-class ore is shipped out of the camp, but the second-class, which assays about \$50 in silver and \$15 in gold, is worked in the custom mill. Dividend No. 5 is declared payable on the 20th inst. It is reported to be the intention of the company to pay but five-cent dividends for some time in the future. This is probably the result of a purpose to curtail the production temporarily, in the belief that better prices for silver will soon obtain, and then with an increased production a proportionately increased profit can be made. The Poser is producing considerable \$30 ore. The Rock Island product assays about \$60, and is being treated at the Lexington mill, which is now running half its batteries on custom ore. The Cora is being actively worked by Rondebush & Young, on the 200 foot level, and is yielding an abundance of silver-copper ore of high grade. On the Gagnon, Burlington, Nettie, and other properties of the Colorado company, and on the Gray Rock and Belle of Butte, of the Silver Bow company, the usual operations continue, with the customary results. They are all working a full force, and their ore yield is limited only by the reduction capacity of the concerns owning them.

Among the copper mines, with the single exception of the Anaconda, operations are active and the prospect has not been brighter for three years. The Clark Colusa is now producing 175 tons of ore per day, which is treated with the most approved appliances that money can buy, ingenuity invent or economy suggest. The smelter is now running exclusively on copper ore, of which it is estimated 200,000 tons are in sight in the mine. The West Colusa, owned by the Montana Copper Company, shows an ore body of from 15 to 50 feet in width, with a 4-foot streak of 40 per cent ore on the lower level. The company could readily supply its reduction works from this property alone, but the ways of copper men, like

the ways of Providence, are inscrutable, if not entirely beyond mortal ken. The Butte Reduction Works and the Colorado smelter are running in good shape and have plenty of ore, while the sampling works is doing a business of about \$100,000 per month.

At no time in the previous history of the camp has so much custom ore been worked or so much money distributed among prospectors, lessees and men with but limited means. In this camp a poor man is likely to make a stake at any time, as hundreds have done in the past, who are now well-known and prominent members of the community.

The only mining sale of any importance which has occurred during the past month is that of a one-fourth interest in the Wild Bill, owned by the Kleinschmidts, of Helena, and sold to the Chambers syndicate a few days ago for \$15,000. The syndicate now owns three-fourths and Mr. Lee W. Foster one-fourth of the property.

Next spring the Goldsmith, which has during the past eighteen months made a rich man of Mr. George Tong, into whose once empty purse it poured over \$100,000, will be stocked and opened up again. The reputation of Mr. Tong as an experienced miner and honorable and successful man will be a sufficient guaranty that the deal will be made on its merits, and that the stockholders will receive the benefit. About half a mile north of the Goldsmith another mine, which also has been idle for some time, will resume operations in the spring. We refer to the Wabash, owned by Captain Emerson & Co., who have raised the capital required to give to that rich property the benefit of a thorough exploitation. The Wabash has produced high-grade ore, and shows a strong and extensive ledge, from which big results may be confidently anticipated.

With such mines and mills and smelters as this camp now boasts, there is no cause for any business man in Butte to look into the future with any feeling save that of buoyant hope and redoubled confidence. That the Anaconda is not in active operation is a matter to be deplored, both on account of the general business of the community and the welfare of the men who expect employment from the company as soon as Mr. Haggin can see his way clear to a resumption and consequent competition with the big Michigan concern which is now ready to attack him in the markets of the world with a better quality of copper and lower rates of production; but Butte is not a one-company camp by any means, and the other interests here are sufficiently varied and extensive to support the present population and maintain business on a solid basis. Butte is to-day the liveliest and most prosperous town in the world of its size. It stands head and shoulders above its most pretentious rivals. The trouble at Anaconda is but one cloud in a sky otherwise of Italian clearness, and that will soon be dispelled by the mutual exercise of reason and intelligence on the part of the management and employees of that company. The onward wave of progress will never leave the Silver City in the rear.

WHAT MAKES THEM PAY.—We have received some inquiries from the East, asking why such mines as the Colorado Central, Mendota, Seventy-Three, Corry City, Terrible, Rogers, Freeland, Plutus, and other well-known properties pay so largely and well. We must reply, good management and judicious development. At the present time there are no broken-down book-keepers, no worn-out schoolmasters, nor any black-sheep family members or cousins managing any of the properties named, nor any other property that is making a record. Champagne, questionable company and blooded horses have been taken from the catalogue of mining necessities, and the gentlemen at the head of each of the properties above named are men who have educated themselves to their business, and who watch it as closely as a prudent merchant watches his business concerns. Most of them are men who took hold of the properties as prospects, and who grew in mining knowledge as the properties grew. The day has gone by for figure-heads in mining concerns.—*Georgetown Courier.*

BLAST FURNACES OF THE UNITED STATES.—The monthly report of the condition of the blast furnaces of the United States, published by the *American Manufacturer*, shows 312 furnaces, with a weekly capacity of 122,641 tons, in blast on November 1, and 272 furnaces, with a weekly capacity of 63,499 tons, out of blast. At the same time last year 233 furnaces, having a capacity of 76,723 tons per week, were in blast. The report shows an increase in the production of charcoal iron over last year of 25 per cent, of anthracite 33 per cent, and of bituminous 80 per cent.

THE DEMAND FOR HEAVY MACHINERY for every conceivable manufacturing purpose was never greater than at this time. Engines with horse-power ranging from 100 to 500 are now in common use, and manufacturers of machinery of huge proportions for textile work and for general manufacturing purposes are overrun with orders.

THE Mexican Cable Tramway Company has elected the following named officers: A. S. Halliday, president; Chas. L. Ackerman, vice-president; D. P. Belknap, secretary; W. Loaliza, treasurer. J. F. Godey, the agent of the company, was authorized to push forward the construction of the cable roads in the City of Mexico.

## The Minting of Gold and Silver.\*

NUMBER 3.

[BY ALBERT WILLIAMS, JR.]

Coiner's Department, Carson Mint.

**Rolling-room.**—The ingots of standard coin metal, prepared in the melter and refiner's department, are next taken to the rolling-room, where they are rolled into strips of approximately the proper thickness, as a preparatory step toward punching out the planchettes. This room is on the west side of the first floor, adjoining the ingot-melting room, and is in charge of the roller. The force here employed is three men.

**Rolls.**—Two pairs of heavy rolls, made of chilled cast steel, are used. One pair, called the breaking-down rolls, first reduce the ingots roughly; the second pair then still further reduce the thickness. The draw-bench in the cutting-room is also fitted with smaller finishing rolls. The rolling-machines were made in Philadelphia; one pair of the heavy rolls were furnished by the Krupp steel works at Essen, Rhenish Prussia, and the others were made in Pittsburgh. The rolls of American make are found to be perfectly satisfactory. Those in the rolling-room each have a face 10 inches long, and are 8 inches in diameter. The trunnions are cast solid with the roller portion, and are 12 inches long and 6 inches in diameter. The journal-boxes are of brass, the lower half being provided with two gibs of babbitt-metal about 90 degrees apart, each  $1\frac{1}{2}$  inches face, and extending the full length of the bearing surface. When new, these babbitt strips project very slightly above the brass face. The rolls are driven at a speed of 78 to 80 revolutions per minute. The limit of play is five-eighths of an inch, and the adjustment is effected by screw hand-wheels. A clock-gauge indicates the distance between the roll-faces with great precision.

**Power.**—The power required to drive a single pair of rolls varies from 8 to 40-horse power, depending upon the character of the work done. When first breaking down the fresh ingots the 30-horse power 10-inch belts often slip, although they are carried on leather-faced hand-wheels. In the final rolling much less power is required. Each roll has its own pulley, the upper and the lower roll being thus driven independently at the same speed in opposite direction. The hand-wheels are 5 feet in diameter, with 10 inches face, and weigh 250 pounds each. They are faced with leather, which is riveted on.

**Rolling.**—An ingot for making standard dollars is  $12\frac{1}{2}$  inches long,  $1\frac{1}{2}$  inches wide, and 7-16 inch thick before passing through the breaking-down rolls. It is reduced in thickness to nearly that of the coin, and is drawn out to a length of 3 feet 1 inch; but the increase of width in the finished strip, as compared with that of the ingot, is almost imperceptible, although it is perfectly free to expand laterally. The strips are rolled and re-rolled as often as may be necessary until they assume the proper thinness. To prevent any flexure of the strips, the rolls are provided on the discharge side with loose, flat, hopper-shaped guides, an improvement designed by the machinist of this mint. Only lateral guides are attached to the feed-side of the machines.

**Testing the thickness of the rolled strips.**—A power cutting-press, similar to those in the cutting-room, is used as a test-punch. It is fitted with adjustable dies and collars for the different sizes of planchettes, and with its trial planchettes are struck from the strips as the rolling progresses. These are tested on a small pair of Troemner scales in the room. The roller is allowed a margin of 0.06 per cent in excess of the standard weight, but of course must not roll the strips too thin.

**Shearing the rolled strips.**—For convenience in subsequent work the long strips are each cut into two equal lengths. This is done by a shearing-machine, which consists in a movable upper and a fixed lower jaw of chilled steel. The jaws are four inches long, and have an extreme bite of three-quarters of an inch at the outer end.

## Annealing-room.

After having been sheared, the strips are taken to the annealing-room, which is in the basement, adjoining the cutting-room, and is in charge of the annealer and his assistant. The work here done is to anneal the strips of gold and silver standard coin metal after their preliminary reduction by the large rolls and preparatory to their finishing treatment on the draw-bench of the cutting-room. The object is to prevent any brittleness in the metal, which would seriously interfere with the subsequent operations, particularly that of coining.

**Furnaces.**—There are two annealing furnaces of the same size and character. They have heavy cast-iron frames and doors, and are lined with Santa Cruz fire-brick. The doors are  $12\frac{1}{2}$  inches wide and 11 inches high. The fire-chamber is 18 inches high, and the grate area is 14 inches by 5 feet 8 inches. The grate bars are arranged across the furnace hearth, and are  $1\frac{1}{2}$  inches wide with 1-inch spaces. Split yellow pine, in 4-foot sticks, is used as fuel. When the mint is running steadily the furnaces are used daily, and consume  $1\frac{1}{2}$  cords per week.

**Annealing canisters.**—The strips are protected by cylindrical copper tubes, capable of hold-

ing several strips each. These canisters are closed at one end and fitted at the other with copper covers, which are luted on with fire-clay. For gold strips they are 3 feet 6 inches long,  $4\frac{1}{2}$  inches internal diameter, and 3-16 inch thick, and for silver strips 3 feet 2 inches long,  $4\frac{1}{2}$  inches internal diameter, and 3-16 inch thick. Two canisters are charged in a furnace together, and are heated a dull red for 40 minutes. The length of exposure to the heat is the same, whether the strips are gold or silver. The average life of the canisters when in constant use is two months; there are 27 in stock.

**Cooling the heated strips.**—On removal from the furnace the strips are gradually cooled in warm water. This is done in two annealing vats, made of wood and lined with sheet copper and provided with hinged wooden covers, also copper-lined. They are rectangular in shape, 4 feet 6 inches long, 18 inches deep, and 2 feet wide. Steam-pipes rest upon the bottoms of the vats, through which live steam from the engine boilers passes, raising the temperature of the water (before the introduction of the strips) to 180° F. The time occupied in cooling the strips to below the boiling point is 10 minutes, making the whole duration of the annealing process 50 minutes.

## Cutting-room.

After annealing, the strips are transferred to the cutting-room. This room is at the southeast corner of the basement, adjoining the annealing-room, is 16 feet square, and is in charge of the cutter. The total force is three men. The work done here is: *a*, The final dressing of the rolled strips by stubbing their ends and reducing them to standard thickness on a draw-bench; *b*, cutting and weighing trial planchettes; and, *c*, cutting out the planchettes for coining.

**Stubbing.**—This consists in pinching one end of each strip so that it can be fed through the rolls of the draw-bench and be seized by the dogs or clutches of that machine. The stubbing apparatus consists of a pair of small chilled steel rolls,  $3\frac{1}{2}$  inches diameter and  $2\frac{1}{2}$  inches face, the upper roll being a plain cylinder, but the lower a cylinder of the same shape, except that its periphery is beveled with four flat facets, each  $1\frac{1}{2}$  inches wide. These stubbing-rolls are adjusted by hand-screws to regulate the distance between the faces according to the character of the strip operated on; that is, whether it is intended for dollars, for halves, or for other coins. The length of the stubbed portion of a strip is 2 inches. The strips are "doped" before treatment, the silver ones by dipping in tallow and the gold ones by being beeswaxed.

**Drawing the stubbed strips.**—The draw-bench is similar in principle to those used in wire-works, but is designed for flat drawing. It has two small adjustable steel rolls, set vertically and revolving freely in opposite directions. The stubbed end of the strip is fed by hand between these rolls, when it is seized on the discharge side of the rolls by the draw-dogs and pulled through. The dogs are clamped by a treadle, worked by the operator. The draw-bench thus completes the rolling of the strips which the large rolls of the rolling-room began.

**Punching the planchettes.**—Two cutting-presses are used. These are of similar size and pattern, and run at the rate of 250 strokes per minute while cutting, but there is a loss of time in feeding the successive strips. Power is applied by means of eccentrics on a counter-shaft under the presses. The feed is by hand, and is regulated by a fixed gauge. Double dies, the invention of the coiner, Levi Dague, are used in cutting out the dime planchettes. They punch two planchettes, side by side, from the strip at a single stroke. A considerable saving in time is effected in this way; but for larger coins it would be impracticable to use double dies, unless with very powerful machinery.

**Testing the planchettes.**—A trial blank is taken from the middle and from each end of every third strip, and is tested on a pair of Troemner assay scales by the cutter's weigher. The power required in the cutting-room is about 10-horse power. The planchettes form about 60 per cent of the original weight of the strips, the remainder being clippings. These clippings, as already stated, are returned to the ingot-melting room, and are there used in filling up the crucibles in which the standard alloys are melted. The planchettes themselves are washed in hot water with potash and soap, dried in pans, and then sent to the adjusting-rooms.

## Adjusting-rooms.

Adjusting consists in filing the planchettes sent from the cutting-presses, if necessary, so that they are brought to the standard weight or within the limit of working tolerance. This work is done by eight women under the supervision of a forewoman. Each adjuster has a small pair of Troemner scales, upon which the planchettes are tested. If a planchette is found to weigh more than the working tolerance allows, it is filed on the edge by rolling it between the thumb and fingers lengthwise over a 10-inch bastard file, thus reducing its circumference uniformly. If its weight is already within the prescribed limits, it is passed without adjusting; if too light, it is condemned. The legal tolerance in weight is: For double-eagles and eagles,  $\frac{1}{2}$  grain; for half and quarter-eagles,  $\frac{1}{4}$  grain; for standard dollars,  $1\frac{1}{2}$  grains. The work is kept well within these limits. Each gold planchette, after adjusting, is re-weighed separately by the forewoman, and all the adjusted pieces are again weighed, by drafts, in the coiner's office. After leaving the adjusting-rooms and being checked in the coin-

er's office, the planchettes are milled in the press-room, rechecked, and sent to the whitening room.

## Whitening-room.

This is on the first floor, at the middle of the north end of the building. The manipulations conducted here consist in: *a*, Cleansing the milled planchettes (at this stage called "blanks") in a hot alkaline bath; *b*, rinsing with hot water; *c*, heating; *d*, immersion in acidulated bath; *e*, rinsing in cold water; *f*, partial drying in riddles with sawdust; *g*, final drying in closed pans. For convenience and for economy of fuel these operations are performed only every other day, except when the mint is running at full capacity.

**Washing the blanks in the alkaline bath.**—The vessel used is a stout copper pan, 30 inches in diameter at the top and 9 inches deep. The charge is 1000 blanks of the dollar size, or a corresponding amount of blanks for other denominations. Both gold and silver are treated alike at this stage. The bath is a strong hot-water suds of soda and bar soap, and its object is to remove the grease. The time occupied in this washing is about five minutes for each draft of blanks.

**Rinsing after the alkaline wash.**—The rinsing vat is a wooden tub, 30 inches in diameter and 18 inches deep, lined with sheet-lead and having a protecting rim and a partial lining of sheet-copper at the top. In this the blanks are thoroughly rinsed with undistilled boiling water.

**Heating the blanks.**—At the next stage of the process the blanks, after having been washed in the alkaline bath and rinsed, are heated to a cherry red in suitable furnaces. There are two of these furnaces, each 2 feet square, made of common brick and lined with fire-brick. The frames and doors are of cast iron. The fuel is yellow pine. The silver blanks are charged in open earthenware pans, and are exposed to the heat for 15 minutes. Gold blanks are charged in rectangular cast-iron canisters hermetically closed and luted with potter's clay, and are heated 20 minutes.

**Pickling the heated blanks.**—The heated blanks are next subjected to an acidulated hot bath. For gold blanks this is a pickle composed of 4 ounces of commercial nitric acid to 16 gallons of undistilled water, and for silver blanks the bath contains from  $4\frac{1}{2}$  to 5 ounces of sulphuric acid (62° Baume) to 16 gallons of water. The pickling process occupies five minutes. A single tub is used for both the nitric acid and the sulphuric acid baths. It is 30 inches in diameter and 16 inches deep, and is of unprotected wood. It is proposed to substitute a lead lined wooden vat for the sulphuric acid pickle. The object of pickling the blanks is to remove oxidation and discoloration due to the canister copper, and, in effect, a slight proportion of the copper of the alloy is removed from the faces of the blanks, thus brightening the surface of the coin. The loss of metal in this process is 0.05 ounce in 1000 ounces of gold blanks and 0.10 ounce in 1000 ounces of silver blanks.

**Rinsing after pickling.**—The blanks are now rinsed with undistilled cold water in a plain wooden tub 18 inches deep and 30 inches in diameter.

**Partial drying with sawdust.**—After rinsing, the blanks are placed in a coarse copper riddle and are partially dried by being shaken with sawdust. For this purpose basswood sawdust, brought from Philadelphia, is employed.

**Final drying in closed pans.**—The drying chambers are of wood, rectangular in shape, 33 inches by 6 feet, and 10 inches deep, and provided with loosely fitting flat covers. They are lined throughout, covers included, with sheet-copper, and are heated to 180° F. by means of a steam coil fed with live steam from the engine boilers and arranged under each pan. In 15 minutes the blanks are thoroughly dry and are now ready for coining.

## Press-room.

The room containing the milling-machines and coining-presses is on the first floor at the northeast corner. Here the adjusted planchettes are milled into blanks, and the blanks (after whitening) are made into coin. The blanks are fed to the machines and presses by women.

**Milling-machines.**—These turn up the edges of the blanks, making them perfectly true. Three are in use: One for standard and trade dollars, requiring one-horse power each; one for subsidiary silver coins, requiring half a horse-power; and one for gold coins, requiring one-horse power.

**Coining-presses.**—No. 1 coins double-eagles, standard dollars and trade dollars. This model is said to be the most powerful coining-press in existence, and is known as the Ajax. The one in the Carson mint was exhibited at the Philadelphia exposition. Its pressure is rated at 152 tons, but employees of the San Francisco mint rate the pressure of the Ajax type at 200 tons. The working speed is from 85 to 98 pieces per minute. The power required is only 5-horse power, and the adjustment is so perfect that a coin may be struck by simply turning the fly-wheel by hand. No. 2 press is of medium size, and is designed for coining eagles, half-eagles, standard and trade dollars, halves, or dimes. It strikes 95 pieces per minute at the usual working speed, and requires nearly 5-horse power. No. 3, the smallest press, is intended for coining quarter-eagles, quarter-dollars, and dimes, but is not in use, as the mint does not make these denominations. Its capacity is 140 pieces per minute, and it requires 2-horse power. The

total press capacity of the mint is one-third in excess of that of the preparatory appliances. Their arches are of the best Scotch pig cast-iron, that of the Ajax weighing over 7000 pounds, that of No. 2 press over 5000 pounds, and the arch of No. 3 about 3500 pounds. The levers are of brass. The original arch of No. 2 cracked on the line of a bolt hole while coining standard dollars and was replaced by a casting  $1\frac{1}{2}$  inches thicker. All the presses run with beautiful smoothness. A 10-inch emery wheel,  $\frac{1}{4}$ -inch face, is used to dress the bottoms of the dies evenly. It is driven at a speed of 800 revolutions per minute by a rubber friction roller in contact with the fly-wheel of the small coining press.

## Tribute to a Dead Prospector.

Hon. C. C. Goodwin, the gifted editor of the Salt Lake Tribune, was a resident of Eureka in the early days and knew the late Captain Foley intimately and well. When he learned by telegraph of the Captain's tragic death, he wrote in his paper of him feelingly as follows: The wires bring news of the death, in his cabin near Eureka, Nevada, of Capt. J. M. Foley. He died from an explosion of giant powder. Poor old Captain Foley! He has been dreaming, for 20 years, of reaching the golden mountains, whose glittering crests he believed all the time that he could see just over the next night. We hope he has found them now. He was the most inveterate of prospectors, and to hear him describe the surface presentations of one of his claims would make a stranger's mouth water, and lead him to believe that when the claim should be fully opened the purchasing power of silver and gold would depreciate 50 per cent. Some men build castles on the solid ground. Captain Foley never built more than a cabin on the ground, but Aladdin's palace, compared to the palaces which the sanguine Captain erected in the air, was no more than a two-room adobe house in this city is, compared to what the Saints' temple will be when completed. So he was careless where his body rested, because his soul enjoyed all the luxuriant surroundings of his enchanted homes a little above the earth. He built them every day, built them, decorated them and furnished them. We have no doubt that, like Israel's King, he peopled them "with men-singers and women-singers," and "gathered also silver and gold and the peculiar treasures of kings and the delights of the sons of men." And "whatever his eyes desired he kept not from them." So he lived, and his dreams made his judgment unsteady. He could see silver where there was only lead, and where there was only iron, and with both he believed that gold was blended in marvelous quantities. So when food was scarce in the cabin it did not matter. He dined above the earth with those he had peopled his palaces with, and the winter wind that might have searched too keenly threadbare earthly garments, never caused a flutter, even, of the robes which were worn on his nights. We are glad, inasmuch as he was to die, that the summons came swiftly and painlessly, and we hope he was translated to where all the outcroppings are pure gold; where the clothing is never shoddy or the groceries bad; where no bills are sent around at the end of the month; where camping out is never uncomfortable, the hills never steep, and where the assessment work is of the easiest kind.

**NEW GOLD FIELD.**—The railroad company is having a well bored at the town of Sites, in Antelope valley, and it was down Thursday 145 feet, without a sufficient supply of water. It had been all the way pretty much through slate. On Thursday afternoon a large piece of quartz was brought up, which showed, so the men said, quite rich in free gold. We saw the piece of quartz and what appeared to be gold, but it was after sundown and we could not tell so well as if it had been light. All hands who had seen it by a good light agree that it was a very rich specimen. As there is very little water in the way, it would pay to sink a shaft 150 feet and drift on a rich quartz ledge. Gold is found almost everywhere in the Coast Range, from Sulphur creek on the south to Elk creek on the north.—*Colusa Sun.*

**THE Sanchez mine,** near Victor Station on the California Southern Railroad, has been relocated and purchased by Los Angeles capitalists. The mine is an old one, not having been worked since 1880. There are two shafts, one down 90 and the other 100 feet, besides a 10-foot tunnel and a 50-foot crosscut. Assays made of ore recently taken from the mine show a high percentage of gold and silver.

\*From the census report on the "Statistics and Technology of the Precious Metals," by S. F. Emmons and G. F. Becker, special agents. The description of the mints and the processes applies to the year 1881, at which time the mints were examined.

## Passing Events.

The one day in the year when we pause from our business occupations and devote a short space of time to giving thanks for our prosperity occurred this week, and in accordance with time-honored custom was made a legal holiday.

The dispatches indicate that the labor troubles at the Anaconda mine, Montana, have been partly settled by some of the men going to work for the reduced wages. If the company can get others to do the same, the whole plant will be again operated at once instead of lying idle until May, as was expected.

Saturday of last week brought the widest-reaching storm of the season. It was quite a cold rain and brought from the north some of its normal temperature. Its extension south was at least as far as Los Angeles, where over an inch of water was precipitated. Heavy snows fell on the Sierras—in fact, snow was telegraphed as far eastward as Ogden. On the other side of the continent there was a complement to our storm, snow and rain being reported at prominent points all over the Great West. The winter has now fairly begun.

The Con. California and Virginia sent down \$100,000 in bullion last week, the largest single shipment from the Comstock in a long time. More mills are to be built in that region and more low-grade ore worked. The market for mining shares continues in an excited state.

## Employment for Our Young Men.

There was a time, and that not very long ago, when a white boy or girl was almost a novelty in California. Many of us can remember when children of American or European parentage were here so rare as to attract special notice. To-day we number almost as many youth in proportion to our adult population as are to be found in the Eastern States, and in this city perhaps more. In the matter of multiplying the race California is, as in many other things, a prolific country. Then our native-born population are apt to be healthy, a large percentage of them surviving the period of adolescence. Not only so, but they are apt to be precocious, early reaching a stage when it becomes necessary for those charged with their education and care to choose for them some pursuit in life.

Now, to properly make such choice becomes everywhere a grave and perplexing duty. But it becomes doubly so in this State by reason of the few occupations open here for the admission of youth, and the unfavorable conditions that attend so many of these. Compared with other highly civilized countries, our manufacturing industries are limited both in number and extent. With the exception of our woolen mills, the making of cigars, shoes, slippers, clothing and certain other minor pursuits, we have nothing that affords any considerable number of our young people steady employment. The picking of fruit, hops, berries, etc., and the various canneries, give them work for a portion of the year, these industries being largely absorbed, and, in some cases, almost wholly monopolized by the Chinese.

Now, under the circumstances above set forth, it behooves us to carefully canvass our material resources and ascertain in what field of labor, if any, the great number of youth in our midst can find suitable and remunerative employment. In the first place, there is the land, of which we have so much easily obtainable, and to the cultivation of which a majority of the on-coming generation of both sexes ought to have recourse for earning a livelihood. Next, there are the mines, to which a considerable portion of our young men and boys ought to betake themselves for a like purpose, the field here being broad and, to those not afraid of a little rough work, especially inviting. Indeed, we are of the opinion that the gold and silver mines of California present to the right kind of young men better opportunities for not only earning an independent living, but for making money, than are offered by any other pursuit either here or elsewhere; and we would strongly recommend such of this class as have not yet made choice of a vocation, and who believe they have the necessary qualifications for the business, that they turn their attention to this branch of mining.

The field, as above remarked, is a wide one. Confining the view to California, the mineral-bearing territory within the limits of this State is alone ample to give employment to a large population for many years to come. Twice, and very likely three or four times as many men as are now engaged at the business might profitably be set to work here were adequate capital supplied. Silver is appreciating in value, while the demand for gold is everywhere on the increase. Mining for these metals is being placed on a better basis than ever before. The business is growing in favor both with practical miners and capitalists, and this because results are all the while becoming more fixed and certain. We are doing the work cheaper and better year by year, the introduction of labor-saving machinery rendering it all the while less toilsome than it was aforesaid. Gold mining, as now carried on, is by no means the drudgery it was in the early day. The miner is not now forced to make long tramps, packing on his back his blankets, and often his tools and provisions, as he was then compelled to do. He has not only less severe work to perform, but he enjoys many comforts to which he was formerly a stranger. Than the mining regions of California there is no more healthful or beautiful country in the world. The social conditions there are good, life and property being as well protected as in any other part of the State. It is altogether a most comfortable and desirable place of residence, and one in which our young men might well seek to establish a living business and make for themselves permanent

homes. As preliminary to engaging in this business it might be well for this class to attend, for a short time, the mining school at Berkeley, and there acquire some knowledge of geology, mineralogy and assaying, as this would be of infinite advantage to them in their new vocation. It is strange that young men in the enjoyment of health and strength will remain in the cities and towns, seeking clerkships and other light employments that ought to be considered the legitimate perquisites of the female sex, who are precluded from engaging in more laborious and manly pursuits. That they will consent to do so can be explained, it seems to us, only on the hypothesis that they are ignorant of the grand opportunities that await the energetic and ambitious in the mineral regions of the State. Hence these words of information and advice in the hope that they may reach the class for which they are intended, and induce them to abandon a field where they are forced to compete with women and girls, and betake themselves to one that, besides leaving them in the enjoyment of their self-respect, promises to bring them better rewards in the end.

## New Hydraulic Nozzle and Gate.

James H. Byrne and Henry S. Welch, of Nevada City, have patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a hydraulic nozzle and gate specially adapted for use with hurdy-gurdy wheels. With high pressures of water it has been impracticable to regulate and alter the size of the jet without so altering the shape of the delivery-nozzle as to greatly impair its efficiency.

In the water pipe in which water is brought to the nozzle, a short distance from the nozzle, is fitted a transversely sliding gate with a screw shank, operating nut and hand wheel. A hole is made through the gate of equal size with the interior of the pipe, and the gate itself extends downward below the pipe, sliding within a seat or case, which serves as a guide for it and which may be left open at the lower end. This extension of the lower part of the gate is of such a length as to more than equal the diameter of the pipe, and when the gate is drawn upward the opening through it passing into the upper part of the case, the lower portion will be drawn across the pipe, thus cutting off so much of the water supply as may be desired, and when it has been drawn across the pipe so as to entirely cut off the water, the lower edge of the slide remains within the case or seat. This is important because it prevents the settling of the dirt or sediment within the case which would eventually fill it up and prevent the gate moving into it.

The discharge nozzle may be any size or desirable shape. It is suitably tapered or contracted so as to discharge a smooth and solid stream into the buckets of the wheel. From the upper rear part of the nozzle, a vertical guide extends at right angles with it, and within this guide a slotted slide is fitted to move, this slide having a width or thickness equal to the width of this nozzle at that point. The slide has a screw shank, fixed nut and hand wheel, so it may be raised or lowered.

From the foot of the slide, and forming a part of it, an extension is formed exactly fitting the interior of the nozzle, and extending to the front or discharge end. The lower part of the extension forms the top of the nozzle, and it will be understood that when the slide is moved downward in its guide, this extension is also carried downward, its sides fitting closely against the sides of the nozzle, which space it gradually closes to any desired extent. In thus closing the nozzle its shape is maintained exactly the same, and the front end is always kept in proper form to deliver the diminished stream of water with the best effect. If desired, the entire jet of water may be cut off by this adjusting nozzle without depending upon the gate.

PAUL's 12-stamp mill on the river two miles above the mouth of Middle Creek, Shasta county, is nearly completed.

THE Baltimore chrome mine, San Luis Obispo county, continues to improve both in quantity and quality of the ore.

MINING, ranching and other industries are steadily building up along the line of the Carson & Colorado railroad.

## Australian Mines.

EDITORS PRESS:—Some time ago there was a report going the rounds of the newspapers about some very rich gold deposits which had been discovered in the northwestern part of Australia. I would like to ask if the reports have been confirmed, and which route would be the best to go there?

AUGUST JOERSS.

Dragoon, Cochise Co., A. T., Nov. 18, 1886.

We have given in the PRESS such information as could be gathered concerning these mines, though very few satisfactory details could be obtained. Like most mining excitements at a great distance, however, the discoveries attracted the attention of miners on this coast, some of whom went to Australia with the hope of being early in the field. One of these miners returned from the Australian fields about a week ago, going back to the mining camp at Cœur d'Alene, Idaho, where he started from. He gives the first account of the mines we have seen, which brings the "excitement" out in its true colors. This miner, whose name is Louis Everson, was foreman of the Trail Creek Bedrock Flume Company at Cœur d'Alene, but was for years a miner in Australia before coming to this coast.

When interviewed by a Cœur d'Alene Record reporter, he stated that he left San Francisco in company with 24 other old miners, all of whom were lured away from California by the vague reports of a newly-discovered El Dorado far away in the wild interior of the island continent. When they reached Sydney and Melbourne the excitement there was still intense. Thousands, influenced by Aladdin-like reports, set out for the "new diggings," more than 2000 miles from Sydney, where they confidently expected to find abundance of "gold—the picklock that never fails." When they reached the fabled field they found no gold, and the enthusiasm of hope suddenly gave place to the despondency of bitter disappointment. The few who were on the ground before the great stampede began did find a little gold, but the diggings were neither rich nor extensive and were soon practically exhausted. The thousands who followed were able to reap nothing but a "harvest of barren regrets." Mr. Everson says that hundreds sacrificed their all to get there, and he expresses the belief that many will actually suffer this winter for the want of sufficient food and clothing. He states that he traveled 1885 miles from Sydney to Windom, where he met so many deluded pilgrims on their return that he determined to go no further, and at once set out on his homeward journey.

In view of these facts, as stated by Mr. Everson, our correspondent in Arizona better stay where he is. The distance to the new ground is so very great and expense so large in getting there, that the fields must be very rich to warrant the voyage. But it seems they are not by any means rich; even if they were, however, there are thousands of miners already in Australia who could get on the ground in half the time and take up all that is worth having.

## Old Minerals.

A remarkable collection of minerals exists in the cellars of the Academia San Fernando, at Madrid. It is contained in a number of boxes, which have filled the cellars for about 200 years.

They come down from the golden age of Spanish domination in South America and in Mexico, when the mines of these regions made them the El Dorado of the globe. No one knows exactly the contents of the boxes, but they are believed to contain the rarest objects, although the scientific importance of collections was but little appreciated in the days when this one was made.

It appears also that collections made by Humboldt during his travels in America, and handed over by him as a kind of scientific tribute to the Spanish Government, are in the same academy, and have been locked up in an untouched box since 1804.

A. Y. EASTERBY, proprietor of the cement works, in conversation with a Sentinel reporter, Santa Cruz, said that he intends, in the near future, to build new cement works at the quarries, which are located near Santa Cruz, at a cost of \$100,000, with a capacity of 100,000 barrels a year, and the machinery in the present works will be removed to the new works.

### The Drumlummon Mine.

A Producing Montana Property.

One of the most famous and profitable mines of Montana is the Drumlummon, belonging to The Montana Company, Limited, an English corporation. The mine is a profitable one. The accounts for the last half year show a balance of income over expenditure of £83,035, out of which two interim dividends at the average rate of 20 per cent per annum have been paid, aggregating £66,000; and there is a balance of £10,435 carried to the credit of the current half year.

During the six months ending June 30, 1886, the mills crushed 19,784 tons of ore, producing a yield in bullion of assay of \$796,689, equal to \$40.27 per ton; but the actual realized value of the bullion amounted to only \$674,648, giving an average of \$34.10 net yield. This difference of \$122,043, or 15.30 per cent, is accounted for by the heavy depreciation of silver and the loss in realization of concentrates. The last half year's run shows not only increase in total amount over same period last year, but a considerably higher value per ton.

The company now owns the whole or part of several adjoining locations. Mr. H. Bratnober, the superintendent, reports that in the last half year the total number of feet run in lateral

has been large, but is all for permanent improvement. The principal additions to the reduction works have been: 1. The introduction of 20 Frue vanners, and of 10 electro-silver-plated copper tables in the 50-stamp mill, for the former of which an additional building had to be erected. 2. The erection of a concentrating house, with 20 Frue vanners for treatment of the tailings. 3. The partial erection and cost of machinery for the new 60-stamp gold mill. 4. The erection of two 54-inchx16 feet boilers in the 50-stamp mill. 5. The erection of four Frue vanners, with additional building in the 10-stamp mill.

Outside of the reduction works, the requirements have necessitated a heavy outlay on machinery for the mine, in which is included the purchase of a double 10x14 inch hoisting engine, and double cage for sinking the shaft to a further depth of 500 feet. In addition to the above expenditure, the company has been called upon for heavy payments on account of the acquisition of adjoining property, represented by a one-half interest in the Empire claim, a one-fourth interest in the Last Hope claim, and the whole interest in the Nine Hour claim.

These mines are 6060 feet above sea level. The width of the lodes is great. Even in the Drumlummon (now extensively developed) the walls in the upper workings have been

into the mill wagons by means of automatic chutes. The stopes are also kept open by strong pieces of timber set so as to resist at right angles to make the passageways large and complete. Nothing is wanting to make the extraction and removal of the quartz as cheap and as quick as possible.

For the purpose of breaking and milling high and low-grade ore separately from each other, two main passes have been arranged, one toward the end of the mill and the other near the end of the south level. It is also intended to make the central shaft between the Cruse and the 400 level a main pass for the retention and discharge of low-grade ore, and to use the north and south passes for storing and delivering high-grade ore. When the high-grade ore is all extracted these passes will be used for low-grade ore. The ore in each case will gravitate from the top of passes into chutes and wagons. Subsidiary shafts will also be sunk to develop the lode below the 400 level.

The high-grade ore is worked in the 50 and 10-stamp mills and the low in the new 60-stamp mill. There is already indication that the ore will increase in "baseness" at an increased depth.

Mr. John Darlington, in his report to the directors, states that when the new 60-stamp mill is in operation the rate of extraction of the

Ex-President Arthur.

The death of ex-President Arthur takes the country by surprise. Though it was known he had been an invalid for a year, still, as no definite account had been given of his disease, the hope was generally indulged that his unusually robust constitution would pull him through.

He was born in Fairfield, Vt., in October, 1830, and was therefore 56 years old at the time of his death. He had received the advantages of a collegiate education, went through the usual transmigration of a school-teacher to the profession of the law. His legal attainments and abilities were respectable, but he was chiefly known as a shrewd and successful politician. Nature was kind to Arthur. He possessed a fine physique, an amiable temper, and his instinctive urbanity made him many steadfast friends. He first became known to the public as quartermaster-general during the administration of Governor Morgan, where he rendered good service. He was indefatigable in efforts to enlist troops in his State and furnish them with abundant supplies during the Civil War. He occupied a seat in the New York Legislature for one session, and under the administration of President Grant won that acme of all New York politicians, the New York custom-house. We are not aware that his in-

SECTION OF THE DRUMLUMMON MINE, MONTANA, SHOWING LEVELS, ORE SHOOTS, ETC.

drifts upon the lode was 1278 feet. New cross-outs amounted to 407 feet, and the main shaft was sunk 90 feet below the 400 level. He estimates the ore reserves, exclusive of what is below the 400-foot level, at 71,817 tons of high-grade and 113,576 tons of low grade. In addition, therefore, to the extraction for milling purposes during the past six months, which amount to 23,937 tons, the reserve of high-grade ore has increased by 33,918 tons, and the low-grade reserves have decreased by 6185 tons. Of the ore taken out, 6536 tons came from drifts and 17,400 tons from stopes.

In the stopes now being worked the Pixley Nos. 2 and 3 in the No. 3 level north, are both of them holding their value and yielding large quantities of high-grade ore. They will average in width from 18 to 20 feet, and in value \$60 per ton. The Pixley Nos. 2 and 3 in the No. 2 level north, which have a varying thickness of from 12 to 30 feet, and a value of \$40 per ton; and the stope in No. 2a level south, which gives an average width of 14 feet and a value of \$40 per ton.

Beyond these workings it is not necessary to encroach upon the reserves which lie in the Sampson shoot of the 400 feet south, the Pixley No. 1 of the No. 3 north, the Sampson on the No. 2a south, the Sampson in the No. 1 south, the Pixley in the No. 2 north, the Sampson in the Cruse level south, and the Pixley Nos. 1, 2 and 3 in the Cruse level north.

The accompanying section of the mine will show the location of the points indicated, and also show the location of the ore.

pierced only at six or seven distinct points. In one place on the 400 level, the lode stuff is 165 feet wide. This lode may be reckoned at 60 to 80 feet wide; the Castletown from five to six, and the Armitage six to eight feet wide. The pay streaks in the Drum Lummum are, however, much narrower than the lode itself.

The ore is disposed in "shoots," as the sectional diagram shows, these being of considerable length and thickness. In the workings north of the main shaft, silver predominates over gold, but in the southern part of the mine, gold takes precedence over silver. The gold, in an exceedingly fine state of division, is associated with quartz, copper, and argentiferous ores, a limited, mere fractional quantity of the silver, is probably metallic, but by far the greater part is in combination with the sulphides of various metals. Neither in the constituents nor value of the ore is there any constancy. Wide variations in both of these particulars are often found to exist within the lineal distance of a few feet of ground.

The mechanical arrangements for supplying the pneumatic engines and rock drills with compressed air, and also for removing the quartz from the stopes to the mills, scarcely admit of any improvement. The air-main extending from the compressor at the mouth of the Markelyne tunnel to the main shaft at its opposite end, is of wrought iron eight inches in diameter. The small air pipes from the main to the drills are mostly two inches in diameter. Between the various levels passes or stations are formed, into which the quartz falls when blasted from the vein, which quartz is delivered

Drumlunnon lode will be about 70,000 tons of quartz per annum, but to increase the productive character and make exploratory work the company must spend from \$8000 to \$10,000 per month. We reserve for another occasion the description of the mills and reduction works. The management of the mine is under Mr. R. T. Bayliss, while Mr. Bratnaber carries out the underground work. The prospects of this great mine are, taken altogether, of a most encouraging character, and when regarded in connection with the quantity of high and low-grade ore in reserve, justify the expectation that the profits now prevailing, if not much increased, will be fully maintained. We are glad our English cousins, who have put money into many mines in this country, are doing so well in this instance.

THE Reese River *Reveille* says: "A new survey is to be made of the Pyramid lake and Walker river reservations, the old surveys being deemed inaccurate. The last-named reservation no doubt embraces some valuable mineral land in the hills adjacent to the lake, which would be thoroughly prospected if thrown open to the public. It is said that during the past few years, and particularly since the rich discoveries in the Hawthorne district, several valuable discoveries have been made and covered up again by prospectors, who realized that it would be useless to expend time and money upon ground to which they could not obtain title from the Government."

CAMAS No. 1 MINE, on the Gold Belt, Idaho, has been sold for \$45,000.

tegrity in this position was ever suspected. He was removed by President Hayes because he was indisposed to sternly apply the doctrine of civil service reform. This removal so exasperated Senator Conkling that, as a rebuke, he pressed Arthur's nomination for the Vice-Presidency at the Chicago convention in 1880.

No man ever came to the executive chair under more trying circumstances. It was well known that he was an ardent friend of Senator Conkling, had warmly espoused his quarrel with President Garfield, and was even in the conspiracy to re-elect Conkling and Platt. In a few weeks Garfield was no more. Since the tragic death of Lincoln the heart of the nation had not been so sadly stricken. Death apotheosized him, and yet such were Arthur's amiable discretion during Garfield's long sickness when the Government was practically without a head, his prudence and eminent good sense on coming into power, that he soon won the confidence and esteem of the people. His great urbanity and courtly manners were the charm of Washington society. Never were the sociabilities of the White House more brilliant. He was an ardent Republican, true and loyal to his friends, and his record is one that the nation may remember with gratitude and pleasure.

ARBOR DAY is celebrated locally November 27th, the date of this issue of the PRESS. Trees are to be planted on Goat Island and at the Presidio. An Arbor Day for the whole State has not yet been chosen.

ABOUT 70 men are employed in and about the Eureka Con. Smelting Works.

## MECHANICAL PROGRESS.

## The Structure of Metals.

There has been a great deal said about the structure of iron, and how the particles arrange themselves in the formation of steel. Iron is said to be fibrous as well as soft steel, and in the hardening process the latter has been thought to turn from a fibrous state to a granular condition. This all seemed quite sensible until the microscope lent its magnifying influence in the way of showing up the internal structure of iron and steel on a large scale. It was then observed that soft steel was composed of minute crystals. The crystals of iron are arranged in fibers, and the fibers are imbedded in layers of slag, in which they were drawn out together in the process of manufacture.

In steel another element steps in by the introduction of a material known as carbon, together with a number of other elements to be taken as impurities. They not only arrange themselves in crystals, but each crystal is composed of a number of minute cells, the iron forming the nucleus and the coating being formed by a layer of carbon. The sulphur, phosphorus and silica, which are the principal impurities, take up their abode in the interstices and cavities between the cells. The latest investigation has brought out the molecules in full view, and by the aid of the micrometer scales their exact size has been determined.

This we must admit is going rather deep into the atomic depths, yet even the atoms themselves are seen at their vibratory work in adjusting the strains and expanding the material to give themselves room to carry out their oscillatory movements under the cohesive difficulties with which they are confined. It is evident, however, from the figures that have recently been given, that the crystals of iron have been taken for the molecules of the material, and if there are a number of cells in each crystal lined up with one element and dressed down with another to make room for impurities, there is a good chance for some one to pocket a supply of theories on the atomic structure of any substance. A highly-polished flat surface can easily be magnified till the fine markings left by the finest rouge and water appear as a hairy surface. A surface brightly illuminated appears quite dark under high magnification. Besides, metals are not transparent, and cannot be shown up by transmitted light, and to get a sight of all that is going on in the hollows and intersections among the markings of this surface, the source of light should be brought directly down upon the surface in the direction we are to view it, for objects are only seen by the rays of light reflected from their surface.

Under the proper manipulation of a good microscope, minute crystals can be distinctly brought out upon a bright metallic surface. Crystals have been thus seen and figured so small that a single crystal occupied only one two-hundredth-thousandth part of an inch in diameter. It can also be seen that when a break in the material or a fracture takes place, the division is made between the crystals without disturbing their material structure, making it difficult to single out a fractured crystal to examine its cellular structure or its atomic makeup; and yet this is only one step in the descending series that leads from the fibrous structure down to its molecular combination.

## Gold Hammering Iron.

A correspondent of the *Blacksmith and Wheelwright* refers to a previous communication in that paper under the above head, where the writer remarks as follows: "This process of cold hammering iron has so removed and destroyed its tenacity as to render it capable of being broken with the slightest blow." Further on he says: "There is nothing inherently wrong in this practice of cold hammering, far otherwise," etc. "The evil rests with the applying of such cold hammered piece of forged work without having passed through the curative process, which is simply this, namely, to heat the piece of forged work in question to a dull red heat and lay it down to cool at its leisure." Then the writer says further on: "By so doing, he enhances its tenacity at least 20 times."

The second correspondent criticises the above extracts as follows: This, I must confess, is not what my education and experience has taught me, but is far otherwise. My belief is that if, by any means, iron or steel has been injured by forging so as to make it brittle or lose its tenacity, no heating will restore it, unless it can be forged and hammered after, and then the restoration will be only partial. In fact, if, by any means, iron becomes brittle and weak, I know of no other way but to put it into the scrap pile and have it made over.

In regard to working iron or steel, I don't think the hammering of iron cold (what a blacksmith would naturally do) does it any injury, and I do know it gives it a stiffness that can be imparted in no other way. If it is heated, after that the stiffness is destroyed.

In regard to forging steel. This I think is true. It is seldom that steel can be hammered at one heat. It is astonishing to witness the ignorance shown by many smiths concerning the working of iron and steel. Still it is no wonder. A man is taken from a farm and made into a "first-class blacksmith" in a very few months. You might just as well take a

blacksmith and try to make a skillful physician of him in the same time.

The making of iron is very much like doctoring a sick man. It requires just as much skill and judgment in the one case as the other. In fact I think the poor judgment in the man who handles the iron may be more harmful than in the physician's case, for while the physician may only now and then kill a man, the poor iron may get into a steam boiler or a railroad axle and kill a hundred or more in a single accident.

**THE NEW STEEL.**—The London papers contain accounts of a new process for the production of titanic steel, the castings obtained from which are said to have risen very greatly in the estimation of numerous engineering firms, in view of the remarkable properties of the metal. These castings are of all manner of shapes and thicknesses, are made in the ordinary green sand, and the surfaces are quite free from holes, flaws, or other bad places. The cast metal can be readily forged and hardened, or annealed, just like a piece of tool steel. In some cases the metal is being adopted for the working parts of small high-speed engines, as well as for some of the parts of large engines, such as the piston-rod and crosshead, in some instances these being made in one casting. For chain-work this kind of steel is commended both on account of its great toughness and strength, and mention is made of a special form of link chain for elevator purposes, which, by an ingenious arrangement, does away with the rivet connecting the separate links; the connection in this case is made by means of a round bar having a projection on one side which will only allow of insertion or withdrawal when the links are of a particular position—and when the pitch of links on one side is much worn the chain can be reversed, its life being thus greatly prolonged. Elevator buckets made from such steel are said to be exceedingly tough, it being impossible to break them by ordinary usage, though they are only about one-eighth inch thick.

**TO TEMPER STEEL VERY HARD.**—A contemporary remarks: "As hardness of steel depends on the quickness with which it is cooled, there are better materials than water, which gives an unequal temper; besides, the steam-bubbles developed interrupt contact; water is also a bad conductor of heat, and if the bubbling and heat did not put it in motion, it would be unfit for hardening. Water with plenty of ice in it gives a hard temper; small tools may be stuck into a piece of ice, as jewelers insert them in a piece of sealing wax. Oil is also used by them as being better than water, as it does not evaporate so easily. The Damascus steel blades are tempered in a small current of cold air passing through a narrow slit; this gives a much more uniform and equal temperature than water. But the most effective liquid is the only liquid metal—mercury. This being a good conductor of heat, in fact the very best liquid conductor, and the only cold one, appears to be the best one for hardening steel-cutting tools. The best steel when forged into shape and hardened in mercury will cut almost anything. We have seen articles made from ordinary steel, which have been hardened and tempered to a deep straw color, turned with comparative ease with cutting tools from good tool steel hardened in mercury. Beware of inhaling the vapor while hardening."

**A NEW PISTON PACKING.**—The New York Belting & Packing Co., New York City, has recently brought out a packing in which white rubber is used instead of the dark, as heretofore employed. As the efficiency of the packings used in steam engine cylinders, valves and stuffing-boxes is always a point of serious consideration, anything which promises to add to durability and efficiency commands attention. In this white rubber square piston packing, that part which comes in contact with the piston-rod is made of successive thicknesses of cotton duck, cemented together with an elastic lubricating compound; but a dark rubber has heretofore been used, with which, under the high temperature to which such packings are often subjected, the rubber back loses its elasticity, and fails to act as a spring to keep the packing against the piston-rod. It is claimed that this new packing will withstand a high degree of heat for a long period—a temperature of 50 degrees F. higher than the regular dark rubber piston packing, and endure 300 degrees F. for a long period.

**A NEW PROCESS OF WELDING STEEL.**—Mr. E. D. Wassell, of Pittsburg, Pa., has invented a new process of welding steel, by which steel bars of any content of carbon can be piled and welded together. He has demonstrated this by making a homogeneous weld of a pile made of bars containing 65 points of carbon. The process is not applicable to bars alone, but any miscellaneous steel straps may be put up in fagot form and welded in the same manner by the rolling process. Another feature of this method is that the carbon can be reduced to any point desired; that is to say, steel of 65 points can be reduced to 10 points in carbon while in the solid form without remelting. The process will cover the working of old rails and old steel scrap. The great usefulness of the invention consists in the fact that piles can be welded from which plates can be made as large as 10 by 4 feet, and thus, it is claimed, the method will cover the whole agricultural field and like branches of the steel industry.

## SCIENTIFIC PROGRESS.

## Brain Work.

The notion that those who work only with their brain need less food than those who labor with their hands has long been proved to be fallacious, says the *Journal of Chemistry*. Mental labor causes greater waste of tissue than muscular. According to careful estimates, three hours of hard study wear out the body more than a whole day of hard physical exertion. "Without phosphorus, no thought" is a German saying, and the consumption of that essential ingredient of the brain increases in proportion to the amount of labor which this organ is required to perform. The wear and tear of the brain are easily measured by careful examination of the salts in the liquid excretions. The importance of the brain as a working organ is shown by the amount of blood it receives, which is proportionately greater than that of any other part of the body. One-fifth of the blood goes to the brain, though its average weight is only one-fortieth of that of the body. This fact alone would be sufficient to prove that brain workers require more food, and even better food, than mechanics or farm laborers.

## Brain Action in Children.

It is remarked in a French publication that in every attempt to control brain action in children, or to aid its action, two factors are needed—nutrition and forces acting upon the brain directing that nutrition; a less co-ordinated, steady, uniform kind of action may be desired—that is, the child may be healthy, but stupid, fat and very slow, strong, but inert—in which case town life and more stimulating food may be needed. As to articles of diet, Dr. Warner says that meat, broth and beef tea appear to produce a stimulating effect upon the nerve system of children, increasing the quantity and brain-stimulating quality of the blood; it may be specially useful in some cases of dull-brained children. But farinaceous foods, in contrast to meat, offer the choice of a dietary of great importance, being less stimulating, more quieting, less suitable to excite brain evolution, more adapted for cases of nervous excitability, especially if combined with fats—in such cases hydrocarbonaceous rather than nitrogenous diets being needed.

**DISCOUNTING THE TELEPHONE.**—According to the daily papers of Chicago, Mr. James Lowth has discovered a new system of transmission of sound which is something remarkable. A few evenings since several friends met at his residence to witness some of the very curious and interesting features of his new system of transmission, by contact with the body of the speaker, through a solid medium instead of through atmospheric impulse, as practiced in all diaphragm instruments. In the new system the instrument is actuated by placing a button projecting from it against the side of the throat, the operator speaks, and the vibrations that occur in the exterior surface of the throat during the utterance of the words are conducted by the button and its stem to the electrodes, and they being disturbed, in accordance with the vibrations that form the muscular word, so to speak, transmit a perfectly articulated word. Conversation is carried on with facility through combined instruments, the tone is much louder and fuller than found in any of the diaphragm class, and its timbre is of a smoother and more solid character. One of its peculiar and very important qualities is that it is independent of all accidental sounds or disturbances which so often interfere with the good surface of the instruments of the telephone system; the speaker may be surrounded by any number of people talking loudly and only his voice will be transmitted. The loudness and clearness with which speech is transmitted with these instruments is wonderful. During the exhibition of this curious new principle the inventor applied the button to the top of his head and transmitted speech in a perfectly clear voice, only not as loud as in the usual way of holding; also to the back of the neck, various parts of the chest, and other parts of the body, all in a good, clear tone, every word well defined and intelligible. A test was made with a 10 pound weight of lead, and through this, as in all other cases, the transmission was perfect. The inventor has a line at his house in operation having a 2-mile resistance. He has taken out American and foreign patents covering this new art.

**MELTING MINERALS.**—By means of a new attachment to the microscope, the melting point of minerals is conveniently observed while under the process of examination. In this arrangement there is an adjunct to the mineralogical microscope by which the melting points of minerals may be compared or approximately determined, and their behavior watched at high temperatures, either alone or in the presence of re-agents. There is a narrow ribbon of platinum, two mm. wide, arranged to traverse the field of the microscope, this ribbon, clamped so as to be readily renewable, passing bridgewise over a little scooped-out hollow in a disk of ebony; the clamps also take wires from a battery, and an adjustable resistance being placed in circuit, the strip can be thus raised in temperature up to the melting point of platinum. The disk being placed on the stage of the microscope, the platinum strip is brought into the field of a one-inch objective, protected by a

glass slip from the radiant heat. The operator is sheltered from the intense light at high temperatures by a wedge of tinted glass, which latter can likewise be used in photometrically estimating the temperature by using it to obtain extinction of the field.

**A GEOLOGICAL RARITY.**—During a recent visit of the members of the Liverpool Science Club to the Lea Green collieries, on the west boundary of the Lancashire coal field, on descending the shaft and traveling a little way along the dip head, they came to what to the geologist was a most interesting feature, called technically by the miners a "squeeze," which consisted in this case of a mass of sandstone 64 yards wide, running through the coal seam, locally accounted for, as the name implies, by the mass of rock having been pushed up through the overlying strata. Science, however, knows nothing of such cataclysms as these, and accounts for the "squeeze" as having been the bed of a river flowing through the primeval forest of the era geologically known as the carboniferous period. In the soft clay underlying the "squeeze" numerous silicious diatoms and minute scales of ganoid fishes were found by microscopic investigation.—*English Labor Tribune*.

**A PHENOMENA EXPLAINED.**—The phenomena attending the passage of metals from the fluid to the solid state is an interesting matter of study, and the beautiful experiment of Van Riemsdijk, showing that pure gold on freezing behaved like water, that is, may be cooled below its solidifying point without becoming solid, is an instance of this. When, however, by agitation, the metal sets, it becomes brilliantly luminous, owing to the liberation of the latent heat of fusion. Passing to solid metals, Prof. Roberts-Austen refers to a forgotten experiment made by Louis Lemery in 1826, showing that lead, when cast in a peculiar form, is sharply sonorous, and he alluded to Reamur's experiments on this subject, which proved that hammering or the transfer of matter from one position to another by flow alters the shape of the grains, and the way in which they touch one another, and leaves them, in the hammered lead, no longer free to vibrate.

**INTERESTING ARCHEOLOGICAL DISCOVERY.**—An interesting discovery has recently been made in Mexico. The rocks which form part of the foundation of the promontory on which the Castle of Chapultepec rests, Mr. Batres says, are covered with hieroglyphic characters, which will prove interesting for the study of Mexican antiquities and history. Hitherto the surface of the rocks has been hidden by a dense growth of moss and shrubs, but they are now being cleared off and the hieroglyphic inscriptions have come to light. Mr. Batres has commenced to decipher the characters, which he confidently expects to be able to finish by spring.

**THE RAPID ABSORPTION OF HEAT IN IRON AT A CERTAIN TEMPERATURE.**—According to experiments on iron by M. Pionchon, iron at about 700 degrees C. undergoes a modification characterized by an absorption of heat that is extremely rapid within an inconsiderable range of temperature. M. Becquerel states that at about 600 degrees the attractive action exerted upon iron by magnets is suddenly diminished. Nickel and cobalt, from a magnetic point of view, present effects of the same order, but at different temperatures—nickel at 400 degrees and cobalt at white redness.

**PROPAGATION OF FLIES.**—Their particular office appears to be the consumption of those dead and minute animals whose decaying myriads would otherwise poison the air. It was a remark of Linnaeus that three flies would consume a dead horse sooner than a lion could. He, doubtless, included the families of the three flies. A single fly, the *Naturalist* tells us, will sometimes produce 20,000 larvae, each of which, in a few days, may be the parent of another 20,000, and thus the descendants of three flies would soon devour an animal much larger than a horse.

**A SCIENTIFIC CURIOSITY.**—One of the curiosities of light and heat is the fact that rays of the sun should pass through a cake of ice without melting it at all, as is the case when the thermometer stands a little above zero. That the rays of heat actually penetrate the ice is shown by the fact that a lens of ice may be used for setting fire to inflammable substances.

**SUNLIGHT ON THE FIRE.**—It is a mooted question whether the sunlight falling upon an ordinary wood fire retards the process of combustion. This is a popular notion, and one writer says it looks as if the fire burned more feebly when the sun shines full upon it. It is now alleged by scientific men that there may be some influence produced by the action of the sun.

**WEATHER FORECASTS.**—The forecasts of the weather bureau of France were verified last year in 90 cases out of every 100, the percentage having steadily risen from 81 in 1881 to 83 in 1882 and to 87 in 1883. Out of 189 alarm signals sent to the ports, 128 were fully verified, 24 were fairly correct, 37 were incorrect, and only two gales were not foreseen.

**FRICTION WITHOUT HEAT.**—The curious observation that friction fails to produce heat in metals under the influence of magnets is now being discussed. Metals so exposed have been turned in a lathe quite cold.

## ENGINEERING NOTES.

## A New Railroad Era in California.

There is just at this time a most unusual degree of activity in railroad building in this State. At no time since the completion of the Southern overland line has there been such an unwonted degree of activity. Railroads are being constructed in both the northern and southern sections of the State, and in the central coast portion as well. Many roads are also in active contemplation. It is estimated that during the present and next two years fully 30 per cent will be added to the total mileage of the State. These improvements will also add vastly to the value of property. The Southern Pacific is especially active in this work, not only in its own proper locality, but in the northern counties as well.

There is now a gap of only 90 miles between the Oregon and California lines of road, and a heavy force is actively engaged in closing up this space; but as the work is very heavy it is expected that about 18 months will be required to make the connection—after which time the iron horse will have full sweep from San Diego to the Columbia. In the mean time the Southern Pacific Coast line is being rapidly extended southward from Soledad via San Luis Obispo, Santa Barbara and Ventura, and thence eastward to Newhall on the present line of road. About 90 miles of this road has already been completed since work was commenced upon it in July last. This road will fork at San Miguel, the eastern branch starting from San Miguel will push its way eastward over the Coast Range into Kern county and strike the main southern road at Lerdo. Crossing that, it will pass on still further to the eastward and open up the rich agricultural country to the north and east of Bakersfield.

These roads, both north and south, will open up to convenient and rapid communication immense regions of country, which have hitherto been of little value on account of their isolated conditions. All this land will be fully or more than doubled in value by this improvement. The road from Soledad and its eastern branch will be about 360 miles in length.

Still other roads are projected in this central portion of the State—the San Joaquin valley. A road 145 miles in length will be started and probably completed during the coming year along the west side of the San Joaquin valley, from Tracy, on the main line, southward to Huron, in Fresno county, at or near which point it will again connect with the main line. This branch will develop a valuable grain country. Another road will be constructed on the east side of the main road, and paralleling the same for a distance of 30 or 40 miles. Several other feeders are in contemplation in that region running to and skirting along the foothills. It is the determination of the railroad people to open up the entire San Joaquin valley to good railroad facilities.

Other roads have also been projected and independent companies organized to construct needed railroads in Solano, Colusa and Lake counties. One of these roads will reach the timber regions of Mendocino county; Humboldt county will also soon be placed in railroad communication with the rest of the State, and Klamath, Tehama, Modoc and Lassen counties all come within the scope of projected railroads.

Los Angeles county is especially active in railroad extensions and new lines. The Atchison & Topeka road has entered upon quite an extensive line reaching from their main line at San Bernardino to the sea coast, via the San Gabriel valley and Los Angeles. The coast will be reached at the new harbor now in process of construction at La Ballona. Another road will be built in another year for Colton via Riverside, the Temescal mountains to Anaheim. The Anaheim road will be extended at an early day along the coast to San Diego. It is estimated that at least 1000 miles of new road will be built in California within the next three years. The railroad people evidently see good times ahead in the near future, for this State, and are determined to be ready to do the increased business of transportation which is sure to come. In their improvements not less than \$20,000,000 will be distributed in California alone for railroad material and labor—itsself a bonanza for the State.

ANCIENT ENGINEERING.—One of the most extensive and remarkable works of the engineers of Ancient Rome is the Cloaca Maxima, well known as the great common sewer of that city. It is of Etruscan architecture, and still serving its original purpose, is as firm as when its foundations were laid. It was built at least 2400 years ago, and is one of the few monuments of Rome whose antiquity has never been assailed.

THE SUEZ CANAL.—The passage of the Suez canal is ordinarily made in 36 to 40 hours, but vessels fitted with the electric light apparatus can go through in 16 hours.

LEAKAGE OF PETROLEUM.—Ten years ago, according to Sir Frederick Abel, the loss of petroleum spirit from leakage and evaporation was as much as 18 per cent, but it has now been reduced to eight per cent in many storehouses, and in Germany the leakage is said to be less than one per cent.

## USEFUL INFORMATION.

THE MANAGEMENT OF LAMPS.—To insure good light, the burners of petroleum lamps should be kept bright. If they are allowed to become dull the light is uncertain, and, owing to the absorption of heat by the darkened metal, smoke is the result. Once a month place the burners in a pan, covering them with cold water, to each quart of which a tablespoonful of washing soda should be added, and also a little soap. Boil slowly for one or two hours, and at the end of this time pour off the blackened water. Then pour enough boiling water into the pan to cover the burners, adding soap and soda in the same proportions as before. After boiling again a few minutes, pour off the water, rinse the burners with clear hot water, and rub dry with a soft cloth. The burners must be perfectly dry before the wicks are introduced. Should the wicks become clogged with the particles of dust floating in the oil, and new ones not be desired, they may be boiled in vinegar and water, dried thoroughly, and put back in the burners. If wicks have done duty all winter they should be replaced by new ones in the spring. Nickel burners may be boiled as well as brass ones. Time spent in the care of lamps is never wasted. A perfectly clean lamp that gives a brilliant light is a great comfort. What more cheerless or depressing than an ill-kept lamp, which gives forth an unsteady, lurid, sight-destroying flame. The paper roses, guelder roses and chrysanthemums, so popular for decorative purposes, are admirable for placing in the lamp chimneys to keep out the dust during the day, and the wicks should be turned a little below the rim of the burner to prevent exudation of the oil.—*New York Commercial.*

OIL ON THE WATER.—Another instance of the marked benefits resulting from the use of oil on troubled seas was afforded by the recent experience of the steamship *Werra*, of the North German Lloyd's Line, which was disabled in mid-ocean during her last transatlantic voyage. The steamer had been taken in tow by the *Venetian*, and all went well until the evening of August 3d, when a strong gale prevailed and heavy seas were constantly breaking over the bow of the *Werra*, endangering the tow lines and threatening the loss of the tow. The captain of the *Venetian* caused an oil bag to be hung from each side of his vessel and dragged some distance astern. The result was almost immediate, and the sea became comparatively smooth around the disabled ship. The officers of the *Werra* were for some time ignorant of the cause of their relief. At the exchange of signals on the following morning, they reported that after the oil bags had been hung out, their vessel experienced much better weather, not a drop of water breaking on board, and the ship being in all respects more comfortable.

HOW TO KEEP CIDER SWEET.—Pure sweet cider that is arrested in the process of fermentation before it becomes acetic acid or even alcohol, and with carbonic acid worked out, is a most delightful beverage. The following scientific method of treating the cider to preserve its sweetness is recommended: When the saccharine matters, by fermentation, are being converted to alcohol, if a bent tube be inserted air-tight into the bung, with the other end in a pail of water, to allow the carbonic acid evolved to pass off without admitting any air into the barrel, a beverage will be obtained that is a "fit nectar for the gods." A handy way is to fill your cask nearly up to the faucet, when the cask is rolled so that the bung is down. Get a common rubber tube and slip it over the end of the plug in the faucet, with the other end in the pail. Then turn the plug so the cider can have communication with the pail. After the water ceases to bubble, bottle or store away.

THE EFFECT OF CERTAIN ODORS.—The aroma of red cedar is fatal to house moths; the aroma of black walnut leaves is fatal to fleas. It is a matter of common observation that persons engaged in the business of making shingles from odoriferous cypress timber in malarial districts are rarely, if ever, affected by malarial diseases, and the persons engaged in gathering and distilling turpentine do not suffer from either malarial diseases or consumption. It is said that when cholera was epidemic in Memphis, Tenn., persons working in livery stables were entirely exempt from it. It is affirmed that since the destruction of the clove trees on the Island of Ternate the colony has suffered from epidemics unknown before, and in times when cholera has prevailed in London and Paris those employed in the perfumery factories have escaped its ravages.—*Boston Journal of Chemistry.*

GALVANIZED WATER TANKS.—It has been shown by French chemists that water passed through 200 yards of galvanized iron pipe takes up 4.29 grains zinc carbonate per gallon. It is on this account the Government has forbidden the use of galvanized water tanks on French men-of-war. Tanks of this kind should also be abandoned in all cases where water is used from tanks for drinking and culinary purposes.

YELLOW PINE AND BEDBUGS.—The *American Architect and Building News* says: "The southern pine seems to be the natural habitation in this country of the *cimex lectularius*, or bedbug,

which is found in immense numbers under the bark of old trees of that species. If the wood contains natural clefts the insects and their eggs remain in these after sawing, and are often carried in that way in the seams of large timbers into buildings. It is worth noticing that living trees of yellow pine sometimes keep houses near them infested with the vermin, which stray in all directions from their home."

HANDY DEVICE FOR DETECTING GAS LEAKAGE.—A handy apparatus for detecting leakage of gas from house service pipes has been devised. It consists of a small pipe bent twice at right angles, and connected with the service before and after the main cock. A small glass bulb, partly filled with a mixture of glycerine and water, is placed on the pipe. A tube dips into the liquid in the bulb, and is so arranged that any gas passing through the small pipe bubbles through the liquid. The bulb is also provided with cocks at its inlet and outlet. If these latter are opened, and the main cock closed and the burners shut off, any bubbles in the liquid show a leakage of gas in the pipes or fixtures beyond.

A NEW COFFEE TREE.—A German paper reports the discovery in West Africa of a new variety of coffee plant whose berry appears greatly to resemble that of Arabia in appearance and flavor. It grows, however, not on a shrub but on a tree nearly seven feet high, which develops rapidly and yields an abundant crop. Arrangements are already being made for introducing its cultivation in favorable localities.

CELLUVERT is a new material formed by passing paper or any fibrous form of cellulose through a bath of nitric acid. The glutinous surfaces so produced are then pressed together and washed, when they form an extremely tough and hard substance, which is well adapted for use in the industrial arts.

THE LION AND THE TIGER.—It has been shown that the strength of the lion in the forelimbs is only 69.9 per cent of that of the tiger, and the strength of his hind limbs only 55.9 per cent. Five men can easily hold down a lion, but nine men are required to control a tiger.

MOLDINESS is occasioned by the growth of minute vegetation. Ink, paste, leather and seeds most frequently suffer by it. A clove will prevent it; any essential oil will answer equally well.

SHEEP SHEARS with two blades and a spring back were used in old Rome for clipping sheep, hair and hedges.

OIL GLASSES will not get clogged up with oil if first filled with glycerine.

## GOOD HEALTH.

## To Prevent Diphtheria.

The Ohio State Board of Health have published a pamphlet, which urges the strict observance of the following rules:

1. When a child has sore throat with fever, especially when diphtheria is present in the neighborhood, it should be kept apart from others until a competent physician has determined it is not diphtheria.
2. When a person is known to be sick with diphtheria, he should immediately be separated from all others, excepting his attendants, and removed to a room which should be specially prepared for his occupancy.
3. This room should be prepared by removing from it all superfluous furniture, carpets, books, window curtains, and all similar articles not needed in the room. It should be as remote as possible from the family rooms—preferably in the upper story—and care should be taken to secure an abundance of fresh air, without exposing the patient to direct drafts.
4. No one should be admitted to the sick-room, except the necessary nurses and attendants.
5. No food or drink which has been in the sick-room should be partaken of by the well. The dishes carried in should be washed separately.
6. Under no circumstances should the bed-clothes or the patient's body linen be mixed with the other soiled clothing, or be admitted to the general wash, without being first thoroughly disinfected.
7. All persons recovering from diphtheria are dangerous, and should not be permitted to attend school, church, or public assembly, until, in the judgment of a careful physician, they are no longer a source of contagion.
8. No public funeral should be held of any person dying of diphtheria. In no case should any child be permitted to attend.

Then follow general instructions on disinfection, with rules for prevention of the disease, etc.

A HEALTH HINT FOR TEACHERS.—Dr. Holbrook, writing of memory culture in schools, says: The teacher should remember that the memory cannot be disciplined to advantage when the mind of his pupil is distracted by feelings, sensations and thoughts foreign to the subject of study. It may also be said that if a child is badly fed, insufficiently clothed, or suffering from some inward complaint; if the

lungs and circulatory system be oppressed by the foul atmosphere of a crowded schoolroom; if the nervous energy be suppressed by imperfect oxidation of the blood; if the eye be deprived of the natural stimulus of a good light, the nostrils assailed by disagreeable odors, and the ears confused with an incessant tumult of noises; if one set of muscles be kept in a state of constant tension and others in a state of abnormal relaxation by sitting in a constrained position hour after hour, a condition must be induced very unfavorable to the culture of memory.

IS THERE A TOOTHLESS TIME COMING?—The American tooth, the dentists tell us, is something fast disappearing. What is to take its place they leave to conjecture. Whether a toothless race is on its way, or whether a new animal is to be evolved from the present human creature on this continent, is perhaps an open question. Whatever it is that may come to pass, the fancy recoils before the prospect. Children of 12 years often have \$100 worth of gold in their mouths, others needing as much quite as badly, but unable to afford the outlay. Children of 16 often wear complete sets of false teeth and other children innumerable have teeth that are decayed before they penetrate the gums, and that have to be filled as soon as they are in sight, the crumbling material and thin enamel, even then, giving but little to work upon. At first it was thought all this resulted from ignorance, from candy eating, from want of care and cleanliness. But it is now understood that in most cases the fault is inherent in the quality of the tooth, and the only remedy so far suggested is a diet calculated with special reference to the making of sound bone. This is supposed to be found in the coarse grains and food of similar character, and the most confirmed beef-eater alive yields to the superiority at this point of the little kernel of grain that feeds his beef itself.—*Harper's Bazar.*

SIGNS OF THE TONGUE.—The tongue is the indicator of the system. A white-coated tongue indicates febrile disturbance; a brown, moist tongue indicates disordered digestion or overloaded *prime vie*; a brown, dry tongue indicates depressed vitality, as in typhoid conditions and blood poisoning; a red, moist tongue indicates debility, as from exhausting discharges; a red, dry tongue indicates pyrexia, or any inflammatory fever; a "strawberry" tongue, with prominent papillae, indicates scarlet fever or rotheln; a red, glazed tongue indicates debility, with want of assimilative power of digestion; a tremulous, flabby tongue indicates delirium tremens; hesitancy in protruding the tongue indicates concussion of the brain; protrusion at one side indicates paralysis of the muscles on that side.

BALE HEADS FROM A SCIENTIFIC STAND-POINT.—A writer in *Popular Science*, supporting the view that a higher civilization tends to baldness or a lessened growth of hair, cites the fact that 48 per cent of men at a Patti concert were bald, while only 12 per cent of those who attended a Sullivan prize fight were without a full head of hair. It is assumed that those who attended the concert were of a higher grade of civilization than those who went to see Sullivan, and that this alone is sufficient to account for the difference in their hair coverings. But the important fact has been overlooked that the Patti admirers had probably neglected to learn "the noble art of self-defense," in which the followers of Sullivan were adepts.

THE TREATMENT OF WHOOPING-COUGH WITH ILLUMINATING GAS.—Dr. W. T. Greene suggests an easily available improvement on the old plan of sending children on visits to gas-works. His plan is to attach a piece of rubber tubing to a burner, the tubing being long enough to reach the floor. The gas is turned on just enough to make a perceptible odor, and the child is to inhale it for a few minutes at a time as often as convenient.—*N. Y. Med. Journal.*

QUININE HAIR TONIC.—The following formula for a preparation containing quinine, to prevent falling out of the hair, is highly recommended: Quinine sulphate, 20 grains; glycerine, 1 fl. oz.; cologne, 2 fl. oz.; bay rum, 2 fl. oz.; rose water, 11 fl. oz. Rub the quinine with the glycerine, and add the other ingredients in the order named. The addition of fluid extract of jaborandi is recommended to stimulate the growth.

LINIMENT FOR EARACHE.—A most excellent liniment for earache is recommended as follows: Camphorated chloral two and a half parts, pure glycerine 16½ parts, and oil of sweet almonds 10 parts. To be well mixed, kept in a hermetically sealed bottle, applied with cotton soaked in the liniment, and placed in the ear twice a day.

EXCELLENT BITTERS.—A medical exchange publishes the following as a most excellent recipe for bitters: One pint alcohol, one ounce gentian, powdered; one ounce cardamom seeds, one ounce orange peel, powdered. Shake up and let stand three days, then draw off for use.

STOPPING HICCUGH.—A Brazilian physician states that refrigeration of the lobe of the ear will stop hiccough, whatever its cause may be. Very slight refrigeration will answer, the application of cold water, or even saliva, being sufficient.

## MINING SUMMARY.

The following is mostly condensed from journals, published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**STRIKE.**—*Sentinel*, Nov. 17: We understand that a strike of richness has been made in the Valparaiso mine, near town. P. N. Peck thinks his chances for a fine winter's run on his gravel claim at Volcano are remarkably good. We have heard it confidently stated that the Moore mine would in the near future employ as many men as does any mine around here. We hope it will. The prospects of the Downs mine, Volcano, are not considered very bright. The \$15,000 put up by the company with which to prospect has been expended, but pay ore has not been found. That such has turned out to be the case is to be regretted. The Volcano Tunnel Co. intend opening up a large open cut, 30 feet deep and 100 long, back of the town, which is thought will throw open a large deposit of pay gravel. An engine is on its way for the purpose of furnishing the motive power to lift the rock.

**KENNEDY.**—*Ledger*, Nov. 20: The Kennedy hoisting works are running by steam, the pipe across the Oneida valley being too small to carry sufficient water to operate both mine and mill. A large wooden tank is being constructed just below the hoisting works. This is intended to store water from the hoisting works for the purpose of using it again for the batteries. This will effect a saving of about 20 inches. The mine continues to look well, and the universal opinion is that it is destined to a long career of activity. They have made one cleanup at the mill, but how the rock yielded we are unable to state.

**MINE SOLD.**—*Len.* Harmon has sold his one-half interest in a quartz claim in Pioneer district to Chas. Garter for the sum of \$2000; \$500 down, balance on time. The claim is said to be a very promising one, and is located near Mace's mill. It was discovered last summer, and two small crushings have been made, realizing in the neighborhood of \$1000. The other owner is Erick Enslie.

**MISCELLANEOUS.**—M. C. Randolph is about to erect a three-stamp mill on the Olive mine at Drytown, which has been idle for many years. The stamps are to be 850 pounds each. The five-stamp mill for S. G. Spagnoli, erected on a claim near Clinton, was completed last week. There remains about 300 feet of pipe to be placed in position. The mill will probably be in motion inside of two weeks.

**SUTTER CREEK.**—Ten additional stamps will be started at the Mahoney mill to-morrow, making in all 30 stamps. They feel confident that they can keep this number running regularly, with the possibility of being able to run the full number of stamps (40) before the end of the winter. Enough rock has been crushed to satisfy the owners that it will pay very well, and there is no danger of coming to a standstill on that score. On account of the severe frosts experienced lately, the water in the canal has decreased considerably. The Canal company are taking advantage of low water, and have a force of men at work cleaning out the ditch between here and Amador City.

**A NEW QUARTZ MILL.**—*Amador Dispatch*, Nov. 20: The Spagnoli brothers have just completed a new 5-stamp quartz mill on their claim at Clinton. The mill is to be used in prospecting and developing the mine.

## Calaveras.

**GOLD CLIFF.**—*Mountain Echo*, Nov. 17: The Gold Cliff mine will resume operations immediately after the next rain. Everything is now being got in order for the winter's run. Messrs. McCreight & Hardy, after years of faithful toil in their mine near Albany Flat, have at last developed an immensely rich body of ore. They certainly merit their good fortune. Mr. Dockstetter arrived in Angels, from San Francisco, last Wednesday evening. Mr. Dockstetter came up for the purpose of pumping out the Jones mine, to admit of its inspection by a company desirous of purchasing it. The Jones mine is situated at the mouth of Carson creek, and about three miles from Angels. The Jones mine is considered by competent judges to be a valuable property. We were recently shown some very rich specimens of rock from the Clark & Maltman mine, situated three miles from Angels, adjoining the Graham & Whittle mine, and about one mile south of Albany Flat. The shaft is now 33 feet in depth, at which point the ledge is three feet in width, bearing free gold in large quantities. This ledge is in the slate and gouge formation. The rock is of the "ribbon" character, so famous for its gold-bearing properties, and is the best we have seen for some time.

**SHEEP RANCH.**—*Calaveras Citizen*, Nov. 20: The Golden Eagle quartz mine has again resumed operations. A contract has recently been let to Lewis & Savage to run 25 feet on each side of the shaft. This is the mine which, a year ago, caused much excitement in mining circles here. The crushing made from it at that time yielded excellently, but the company was not then prepared for extensive development. The only means of hoisting was by a windlass and no great depth could consequently be attained. Old miners believe there may yet be something in store for the owners as work progresses.

## El Dorado.

**QUARTZ.**—*El Dorado Republican*, Nov. 18: Some very rich quartz has been taken from the Adams' Gulch mine, about one and one-half miles northeast of Nashville. It is now owned by Drs. Smith and Duncan, of Plymouth, and J. C. Heald, of Nashville. At 70 feet in depth they have a ledge two feet wide and it is believed that the rock so far taken out will average nearly \$100 per ton. Two and one-fourth tons were worked in an arastra and yielded \$1350. They have now about 75 tons of quartz on the dump, which they consider to be worth \$6000.

**ACTIVE.**—*Georgetown Gazette*, Nov. 20: This fall has been one of unusual activity in this vicinity. Probably no less than \$200,000 has already been paid out by the Walker Bros. in mining development here, while several thousand dollars are being paid out by the California Water Co. in enlarging their main canal and building flumes.

## Fresno.

**THE MINERAL BELT.**—*Fresno Expositor*, Nov.

19: There is much interest being manifested in Fresno county mines. There are hundreds of men now at work prospecting for new mines and developing the older discoveries, and the flattering prospects encourage them to believe that a district equal if not greater in richness and number of mines exists in Fresno county, on the north side of the San Joaquin river, than any ever before found on the coast. The mineral belt, however, extends clear through the county, splendid developments having been made between Kings and the San Joaquin rivers and also on the south side of Kings river in Sampson Flat district. Capital is now interested in the mines north of the river, and therefore the mines are being worked systematically, and machinery for the proper working of ores has been constructed. In these mines the developments have been very encouraging to the owners, and we look to see a heavy output of bullion from a number of these mines next season. In fact, already, a fine yield of precious metals is being obtained from several mines, giving to their owners handsome dividends. Fresno county mines, like Fresno county raisins, wine, wheat, wool and other products, are at the head, and will aid in adding to its wealth and permanent prosperity.

## Inyo.

**KEYNOT MINE.**—*Inyo Independent*, Nov. 20: Last Thursday John Anton and Mike Lasky came into Lone Pine from Keynot. They brought along the proceeds from 106 tons of ore just crushed. The yield was 273 ounces of retorted gold, worth at least \$14.50 per ounce; total value, \$3958.50; average value of ore per ton, \$37.34. The mine is very high up in the Inyo mountains, and no more milling will be done this winter. Eight men will be kept at work till next spring; the mine is now reported to be looking better than at any other time since it was opened.

**DARWIN MINES.**—Eddy & Wilson are putting up a mill at Coso. The work is pushed along as rapidly as possible, under the direction of Billy Smith. The Mariposa mine will be opened up again. New hoisting works are being got ready and men are at work clearing up the mine. When the hoisting works are ready, a full force of miners will be put to work in the mine. Jim Carney is in charge of the work. Manton & Bush are taking out fine ore from the Liberty mine, one mile distant from the mill. In the Defiance mine, eight men are at work. They are taking out fine ore from the lower levels. Arthur Smith is working a fine gold prospect in Slate Range. The camp and surrounding country are prosperous and have a good outlook.

## Mono.

**BODIE.**—*Bodie Miner*, Nov. 22: South drift, on 800, is extended 14 feet. Upraise from south drift, on 800, is extended 25 feet. Stopped winze below 700, and started upraise from 800, which is now extended 25 feet; crushing about 25 tons of ore per day.

**STANDARD CON.**—South drift, 300 level, advanced 16 feet; west drift, same level, advanced 12 feet; upraise, same level, advanced 13 feet; north upraise, same level, advanced 15 feet. South drift, 1000 level, advanced 15 feet. Ore shipped to mill, 370 tons.

**MONO.**—Working rich ore above the 700.

**BULWER CON.**—North drift, 75-foot level on the Stonewall vein, is extended six feet; vein shows about 14 inches of ore. North drift, east ledge, 100-foot level, is extended ten feet face in fair ore. Started a west crosscut during the week from the Homestake south drift, 100-foot level, to cut Stonewall vein 40 feet south of Bulwer main shaft. Crosscut advanced 12 feet. South drift Homestake vein, 100 foot level, has been run 15 feet—ten inches high-grade ore in the face. We shipped to the mill 416 tons of ore, average pulp assay, \$19.35. We shipped to San Francisco on the 16th instant, \$9120.08.

## Napa.

**MINING IN KING CANYON.**—*Calistogan*, Nov. 17: Gov. Alger, of Michigan, is, we are pleased to know, now interested in the Red Cloud mining claim in King canyon, and work has again been commenced there, the cash necessary to defray expenses being sent here. The Governor several months ago sent money to the coast for the purpose of prospecting the claim referred to, but unfortunately for all interested, very little of it reached Calistoga. There will hereafter be no delay on account of the failure to receive money from the Governor, and the claim will now be prospected. It will not, however, require a great deal more labor to prove whether there is anything in it or not. Being an extension of the Grisby & Johnson mine, which is a very fine property, it should be valuable ground. We hope it will prove to be such, as the discovery of ore in another claim in the canyon would live up matters a little here in the line of mining. It would further assist in proving what we have claimed for the past nine years that Calistoga mining district will yet be of much importance among mining men of the State, and greatly assist in building up Calistoga.

**GREAT WESTERN.**—Though the prospects at the Great Western Quicksilver mine are better now than at any previous time during four years or more past, several of the miners, for certain reasons, have not lately been given work. However, they remain at the mine, we judge, as none of them have come this way. The fact that all miners there have not been given work has been the foundation for a rumor that business at the mine has been entirely suspended.

## Nevada.

**TUNNEL COMPLETED.**—*Nevada Herald*, Nov. 16: The new piece of tunnel run by the South Yuba Canal Co., to connect with the tunnel that passes through the ridge above the Manzanita mine, has been completed and water is now running through it. The object in constructing this branch tunnel was to cut out a bad piece of ground that gave much trouble from the caving during the wet season.

**MINING CONSOLIDATION.**—*Foothill Tidings*, Nov. 18: The Lone Jack and Omaha quartz mining companies have consolidated, and operations will be immediately commenced. San Francisco and Sacramento capitalists are the principal movers in the enterprise, and they intend to fully test the merits of the mines.

**THE PEABODY MINE.**—*Foothill Tidings*, Nov. 22: This morning a *Tidings* reporter took a look at some ore from the Peabody mine. The ore is of good quality, showing bright, free gold, backed up

with good-looking sulphurets. The reporter walked around to the mine and found that the miners had just begun stoping, and had on the dump about two tons of ore which will mill well. There has been a good deal of work done of late at the Peabody. About 300 feet of drifts have been run ahead of the stoping, and this gives about 70 feet of backs, the ledge averaging from six inches to one foot in thickness. Where the ore is now coming from is 185 feet from the surface, and soon a crushing of from 50 to 60 loads of quartz will be had. The mine is in good shape for working, and it is calculated that about 60 loads of ore per month will be taken out for milling purposes with the small force of men now working there. Of course this amount of ore will be greatly increased when further developments are made. Water power is used at the Peabody.

**RICH QUARTZ.**—*Grass Valley Union*, Nov. 20: Rich quartz is becoming a very common thing in Grass Valley. It is so common in fact, that it hardly attracts attention. Of course a man will stop, take a look at a fine piece of ore filled with the bright and shining metal, remarks that it "looks well," and move on. If the same kind of ore were exhibited, and it was said that it came from the banks of the river Nile, way in the heart of Africa, or if it came from any other way-off place, it would cause an excitement, and people would flock to that out-of-the-way country by the thousands taking a great deal of capital with them for investment. There is no better field in the world to-day for the capitalist to invest in mining than right here. The gold is known to exist here; the old mines are all paying handsomely; the prospects are showing up finely; mines that were abandoned years ago as worthless have proved to be rich when reopened, and there are hundreds of ledges in the district which will prove as good as those now being worked and which pay so well, if they are only brought to light with powder, pick and shovel. The mining business of this district is in its infancy as yet; but time will bring about the necessary labor, and capital will not long hold back in coming to find profitable investment in this great gold mining region.

## Sierra.

**HORSE-SHOE.**—*Mountain Messenger*, Nov. 13: The owners of the Horse-shoe mine have got everything snug for the winter, and will keep at least four men at work all winter. The upper Extension tunnel, Bassler Bros., contractors, was, at last accounts, in over 50 feet, and all in blue-colored gravel, believed to contain gold. A dump will be put in soon. E. D. Ayers, superintendent of the Gold Valley quartz mine, was in town this week. He reported all the winter freight had been received at his mining district, and that the quartz mines, ere spring, will be well developed, insuring a speedy construction of a good wagon road from the county-seat to Gold Valley.

**PILGRIM MINE.**—*Tribune*, Nov. 19: Information has been received at Forest City that this mine will soon resume work. It is said that the mine is about to be sold, and that the purchasers will resume payment of all the outstanding debts and liabilities of the old company. Dr. H. S. Sanders, the superintendent, is in Nevada City.

**RISEING SUN GRAVEL MINE.**—At this mine, in sinking a shaft for the purpose of striking bedrock, so much water was encountered at a depth of eight feet, that further work had to be suspended. Operations will be commenced anew next spring with the aid of an air-pump.

**MINING PROFITS.**—Who dare assert that mining is unprofitable in view of the following figures? The Sierra Buttes mine, of Sierra City, has paid to its stockholders dividends over \$1,475,000 since 1872. The Plumas Eureka has paid over \$1,900,000 in dividends since its purchase by its present owners. Both of these mines are owned by the same company. These mines will some day rival in richness the world-renowned Potosi mining district, South America, the products of which, from the time of its discovery in the year 1544 up to 1872, amounted to \$50,000,000, and from 1872 to 1877, \$34,000,000.

**THE YOUNG AMERICA.**—The Young America mine has laid off 25 men. They will be allowed to resume when rains set in. Only 10 stamps are running on account of lack of water. The water supply there which is had from the upper and Sardine lake is becoming very meager as the cold weather continues. Unless rain soon sets in it is thought that the mine will have to close down.

**LATER.**—Since writing the above we are informed that the company has concluded to shut down altogether, until the water supply increases.

**SIERRA CITY'S OUTLOOK.**—Before many months Sierra county will be entitled to be ranked as the banner quartz-mining county of the State. Capitalists are fairly alive to the fact that chances for profitable investment in this locality are second to none in the Sierras. Ever since the rich strikes at the Phoenix and Young America mines, they have shown marked eagerness to invest their capital in our midst. The spring of 1887 will be the commencement of an immense boom for Sierra City.

**FIRE IN THE IDAHO MINE.**—A fire broke out in an old shaft at the 400-foot level in the Idaho mine, Grass Valley, last Friday, and continued burning until Saturday afternoon. It is supposed to have originated by one of the miners putting a candle too near the dry timbers. The men went to work as usual on Monday, but the mill did not start until Tuesday, on account of scarcity of rock caused by the fire. The damage done amounted to between \$2000 and \$3000.

**COLUMBO MINE.**—M. Mooney and Wm. Peneluma, who have in hand the contract to run 100 feet in the upper tunnel, met with a large volume of water at a distance of 25 feet. This is considered a good indication that the ledge will soon be reached. Rich pay ore has been taken from this level.

**CELINAS AND MERCER MINE.**—The prospects at this well-known mine are said to be very bright; 400 feet of tunnel has been run to date. The ledge is now 4 feet in width and contains rock which will readily mill \$40 per ton. We shall say more of this mine shortly.

**FOREST CITY.**—*Mountain Messenger*, Nov. 20: For various reasons the Extension Co. has laid off part of its force. The freezing of their water supply cut off air from the main tunnel, and operations ceased. The Ruby men are having a lay-off for the same reason. The new discovery (old North Fork) have struck solid ground which prospects well.

## Tuolumne.

**QUARTZ MINING.**—*Tuolumne Independent*, Nov. 20: There is no doubt that an impetus will soon be given to the quartz mining in this county by the investment of outside capital. Rumors on the street repeat—as we have before noticed—that the Buchanan is about changing to a heavy English company. The Buchanan has a 20-stamp mill in full operation, and gives employment to about 60 men. The ore runs from \$25 to \$30 per ton. The 500-foot level, the deepest attained, looks better than any other part of the mine, having a 10-foot vein showing free gold. The Confidence group of mines will also change hands to an English company of large capital in the near future. The re-opening of the Confidence will give new life to that important section of the county. The motive power will be water, thereby reducing the expense of raising and crushing ore to a minimum. The mine has only been worked to a vertical depth of 275 feet, which is really only a surface mine, and from what we know there are large reserves of low-grade ore, as well as rich chutes which are known to extend downward in this mine. We hear that work will be started on the Rawhide next month by a party of capitalists, and, in all probability, many of the adjacent mines will be thrown into the same company. Rawhide, No. 2, belonging to Alvinzar, Hayward and Hobert, is being opened. They have a four-foot vein, which looks very well, and Richard Chute is doing some work on his Rappahannock and O. K. mines. Tuolumne county has always had so many set-backs on account of want of capital, that we are pleased to know that men of means are now coming to the front to boom our mines into well-merited notice.

**SOULSBYVILLE.**—*Union-Democrat*, Nov. 20: The parties who have the Basin Slope mine bonded have finished cleaning out the drifts that were caved and find the veins as represented by the owners. The parties are expected up shortly and probably will purchase the mine, which is no doubt far superior to any in the county. Messrs. Clark & Brown are having rock hauled from the Pennsylvania mine to their mill, and will commence crushing this week. I am informed that they have quit work on the Pennsylvania for the present, there being too much water for a windlass. It is said they have a good-sized vein and that the rock is rich, but a hoisting works will be required to work it in a proper manner. It is no doubt a good property.

## NEVADA.

## Washoe District.

**CONSOLIDATED CALIFORNIA AND VIRGINIA.**—*Enterprise*, Nov. 20: 1300 level—The drift running north from the Consolidated Virginia shaft has been extended 51 feet; total length, 307 feet. 1500 level—The drift running north from the Consolidated Virginia shaft has been extended 52 feet; total length, 160 feet. 1600 level—The drift running south from the north end of the mine has been extended 36 feet; total length, 353 feet. 1435 level—The east crosscut has been extended a distance of 30 feet to the east clay of the ore body, from which point a station is being cut out, preparatory to sinking a winze to the 1550 level. The ore which is being extracted from the different levels of the new development is averaging higher in value than during the previous week. 1650—The drift running southwest from the C. and C. shaft has been extended 16 feet; total length, 563 feet. The upraise which is being carried up from the east crosscut on this level, directly under the ore development on the levels above, continues to show a good quality of ore. Shipped to Morgan mill 1043 tons and 1670 pounds of ore, and to Eureka mill 1711 tons and 820 pounds. The average value of the ore worked at these two mills during the week, according to assays of the samples from the batteries was \$44.22 per ton. Bullion shipped to office in San Francisco—assay value, \$100,889.32.

**BEST AND BELCHER.**—600 level—East crosscut No. 1 has been extended 46 feet; total length, 588 feet. The east drift from east crosscut No. 1 has been extended 39 feet; total length, 167 feet. This drift has passed through the clay, and is now in a porphyry formation. 800 level—The north lateral drift has been cleaned out and retimbered 94 feet; total length, 694 feet. The face of this drift has reached the northern boundary of this company's ground.

**OPHIR.**—1065—Are continuing cutting out a shaft station on this level. Hoisted through this shaft 181 tons of waste for Ophir, 183 for the Mexican and Union, 510 for the Consolidated California and Virginia, and 263 tons of ore for the Consolidated California and Virginia.

**OCCIDENTAL.**—Upper tunnel—At a point in the north incline winze connecting the upper and lower tunnels, 48 feet on the slope below the track floor of the upper tunnel, a south drift has been advanced six feet.

**MEXICAN.**—1300 level—The joint Mexican and Union drift running north from the Ophir shaft has been extended 20 feet; total length, 106 feet.

**UTAH.**—472 level—The west drift has been extended 55 feet; total length, 375 feet. This drift continues in a clay and porphyry formation.

**GOULD AND CURRY.**—425 level—The north drift from the main west drift has been cleaned out and repaired 50 feet; total length, 203 feet.

**SIERRA NEVADA.**—520 level—West crosscut No. 5 extended 47 feet; total length, 187 feet. This crosscut is in quartz giving low assays.

**UNION CON.**—(Report same as that of Mexican. —*Rep.*)

## Cherry Creek District.

**DULL.**—White Pine *News*, Nov. 20: A Cherry creek correspondent writes that times are very dull there. The Exchequer mine has shut down and the mill is running on ore from the dump.

## Como District.

**SUSPENDED FOR WINTER.**—*Virginia Enterprise*, Nov. 20: All the mines and prospecting locations in Como mining district, some ten miles southeast of Dayton, and 18 miles from this city, have suspended operations for the winter, except the Como-Eureka. A "crushing" of ore, shipped from it recently, consisted of 40 tons hauled to the Bossell mill, in Sixmile canyon, and 47 tons to Briggs' mill, below Silver City. Owing to the freezing weather impeding operations, that at the Bossell mill is not

quite reduced, but it goes about \$30 per ton. The 47 tons at Briggs' mill yielded a bar of bullion worth \$1200. The bullion contains a large proportion of gold, being worth \$5.44 per ounce. This ore all came from the 140 level, and being taken out without selection or assorting, it practically shows the correct milling average merit of the mine. The Symons brothers, Bennett and Harry, have been working and exploring the mine for the last four or five years, in connection with Col. M. N. Stone and Judge Belknap, and have paid their way thus far from the proceeds of the mine, not owing a cent at the present time, and with a prosperous future before them, having plenty more ore of the same sort in their mine. They have leased the old Welter mill of five stamps, which is being overhauled and repaired, and will be ready to start up on the first of next month. Meanwhile the steam-hoisting machinery at the mine is also being repaired and straightened up, and they will be able to keep the mill well supplied when it starts operations.

#### Cottonwood District.

CLOSED DOWN.—*Silver State*, Nov. 17: News has been received here of the closing down of the Nickel and Cobalt mines at Cottonwood. It appears that the English Co., which bonded the mines, did not make the last payment in the time specified, and the mine was closed. It is greatly to be hoped that arrangements will yet be made by which work will be resumed. The mines are said to be rich, and if such is the case, they ought not to remain closed.

#### Jackrabbit District.

ORE SHIPMENT.—*Pioche Record*, Nov. 16: The Onondaga mine made another shipment of ore on Tuesday. Last reports say that the mine looks fine, but there is no telling what a day may bring forth. Big expectations are looked for at this prospect. It has paid its way thus far. Few prospects pay their way from the first jump.

#### Mount Rose District.

PARADISE VALLEY M. CO.—*Silver State*, Nov. 22: Wild Goose drift shows no change except more water in face than usual. No. 4 tunnel, face, shows less favorable indications than at date of last report. The engine shaft is in harder ground, and all the indications confirm the opinion that the vein has pitched to the west and crossed the shaft. We have been following a seam of quartz in No. 5 tunnel, which we find has diverged to the west of the main ledge. We have discontinued following it and have gone back to the point where the vein split, and are now running on the other strata.

#### Taylor District.

DRAFT OF MEN.—*White Pine News*, Nov. 20: A draft of 20 men was made from the Monitor mine last Sunday, leaving the working force only 12 men. It is not likely it will be increased before spring.

#### White Pine District.

BULLION.—*White Pine News*, Nov. 20: The Eberhardt-Monitor Mining Co. shipped this week, through Wells, Fargo & Co.'s Express, three bars of bullion, valued at \$2300.

#### Secret Canyon District.

VARIOUS MINES.—*Eureka Sentinel*, Nov. 18: Orders have been received to ship the machinery and rock-breaker from the Geddes mill to Montana. The tributaries in the Geddes are taking out lots of ore. Barney McKory and Doc Hamilton have left Secret canyon and taken a lease of the California mine in New York canyon. The Oswego mine is for lease, with good ore to start on. It is the property of H. K. Mitchell, Esq. Sam Delmore is getting some very rich ore from the Basey mine. M. H. Joseph, who has been working alone in the Water Jacket mine, is about to quit it and go back to the Golden Rule series before the winter sets in. A lease will be given on the Water Jacket mine in a few days. This is a good chance for chlorides. There is rich ore to start on in four places in the mine.

#### ARIZONA.

AT WORK.—*Prescott Courier*, Nov. 19: Owners of the Buckeye and adjoining claims, on the Tiger lode, Bradshaw district, are systematically at work, prospecting said claims, by tunnel. They think they have good properties and are not afraid to test the truth or falsity of their opinion. Two of our best miners, Jack Lawler and B. T. Riggs, have a contract for running ever so many hundred feet of tunnels. Mr. John Hutchins, of Groom creek, was here yesterday and gave us to understand that the Nevada mine continues to give up plenty of gold rock that will pay well to mill. Gentlemen who are hunting for gold properties would do well to visit Big Bug, Black canyon, Cherry, Bradshaw and some other districts around Prescott, where good-sized veins of gold-bearing quartz exist. One trouble with our mines appears to be that they are not sufficiently developed to satisfy some experts. Our miners are told to sink, but, as many mine-owners are not in a fix to sink deep, they are, we presume, willing to give up interests in good veins to men who will develop them. Taking everything into consideration, many mine-owners have done good, faithful work in their mines and cannot be blamed for not having pierced them deeper. It takes capital to do that. Could poor mine-owners sell their ores on the dump for fair prices, they would, we opine, keep on developing; but as they can neither sell nor eat their ores, many of them are compelled to work for wages, occasionally, in order to save something to purchase food, tools, etc., for assessment and other work on their own property. It is such people who cry for the right kind of reduction works with different management from that which prevailed at Howell, where miners say they were never properly treated. Perhaps, when the railroad reaches Prescott, ores and concentrations can be shipped much cheaper than at present. If so, more mining will be done in several districts, and the output may induce some strong company to start and run the right kind of reduction works here. Until this happens, we will have to ship our richest ores, mill and concentrate poorer ones.

A PROMISING GROUP.—*Silver Belt*, Nov. 16: The very encouraging results recently obtained in prospecting the Stonewall mine and other adjacent mining claims, all of which are located within two miles southeast of the town of Globe (not to be confounded with the Stonewall Jackson at McMillen),

give sufficient reason to predict a splendid future for that particular locality, as an important mining camp. The hills on which these different claims are located are easy of access, and the geological formation is very favorable for rich and permanent ore deposits. There seem to be quite a number of veins, most of which are found at the contact between igneous rocks and quartzite, while smaller stringers are running through these rocks. Granite, porphyry, quartzite and diorite, in regular belts, are the prevailing formations, with but a small body of dolomitic limestone in one place, and chloritic slate in another. The veins themselves vary much in their character; some contain the secondary products of decomposed silver—copper glance and other combinations of silver ores, which have percolated through the fissures of quartzose gangue as a ledge matter, and the silver now appears in the shape of a greenish chloride; these ores are strictly free-milling ores. Other veins contain argentiferous lead ore partly as carbonate, partly as galena, and some of these are very rich. Of the mines more or less extensively worked, the Stonewall is the most important. Quite a large quantity of low-grade, free-milling ore was extracted several years since, but it is seen now that the former work hardly touched the real ore deposit on the vein, and that which had been mined was merely an impregnated mass of talcose matter, the production of decomposed talcose diorite. The workings in the Stonewall include one shaft 250 feet deep and several smaller ones, together with many drifts and crosscuts, but none of sufficient extent. Another mine quite extensively prospected is the McCormick, said to be the oldest claim in Globe district, and where most excellent ore has been found. It is claimed that in that mine, too, the work was erroneously done, and that the vein had been lost.

#### COLORADO.

WORKING.—*Idaho Springs Gazette*, Nov. 16: Bill Brooks and others are working the Victor, just above the German, Virginia canyon. A number of properties at the head of Virginia canyon are being developed. Mike Graeff made a new discovery on this side of the Mayflower mine and took out a fair quality of mineral. The Bald Eagle mine, Virginia canyon, looks well. A fine body of ore has been encountered, which shows well in gray copper. A few leasers are at work on the Champion, property of the English Co. Their 50-stamp mill has been running on custom ore from different mines. The production of the Freeland for the month of October was: Gold, \$118,778.18; silver, \$3721.58; copper, \$56.05; total, \$22,555.81. The production of the Plutus for the month of October was: Gold, \$3330.70; silver, \$2624.84; copper, \$100.41; total, \$6055.95. The Quota lode, Chicago creek, is being profitably worked by driving drifts, etc. The 10-stamp mill, under charge of Mr. W. B. Tarr, treats the ore from this mine. After amalgamating the free gold, the tailings, which are jigged, are sold at the smelters and bring a good price. J. M. Ireland and Andrew Phening have been rewarded for their persistence in driving the level of the Fairmount mine. The drift opened out into a body of fine ore, the mill-dirt being from two to three feet wide, and running well under stamps. The tailings are sold to the smelters. The German mine, at the head of Virginia canyon, after producing thousands of dollars in years past, has stood idle for a long time. But recently a party of leasers took hold of the property, and after taking the water out commenced sinking, and, we are pleased to note, have been rewarded by striking ore worth \$125 per ton. There are other mines in the county that only need development to show up as big as the German.

#### IDAHO.

CLAYTON SMELTER.—*Ketchum Keystone*, Nov. 16: The Clayton smelter has had a successful run of about five months, shipping some 25 carloads of bullion and several carloads of matte, besides shipping 200 tons of first-class ore from the Skylark mine. Some high-grade ore has also been taken from the Ella mine, belonging to the Co., and the indications are favorable for a large product from that mine in the future. Many strikes are reported this season from the various camps in the vicinity, insuring a permanent supply of ore. The only drawback to the camp is the limited supply of lead ore. It is expected that arrangements will be made the coming season to treat a part of the ores by leaching or milling, which will greatly increase the output of bullion.

SHEEP MOUNTAIN DISTRICT is destined soon to become one of the most prominent mining camps in the Territory, if the recent discoveries in that vicinity prove to be permanent deposits. Several parties have been working placer claims in a small way on Salmon river, a few miles above Clayton, and several hundred dollars' worth of dust has been taken out this summer.

BOULDER DISTRICT.—We hear some good reports from the Ophir and Yankee Blade at the head of Boulder creek. In the Ophir a 350-foot tunnel has been started below the ore chute. The ore taken from this mine has been of very high grade, and has yielded a handsome income to its owners. The last of the winter supplies have been taken up sufficient for 10 men during the winter. The Yankee Blade, situated above the Ophir, is under lease to Geo. James, George Kemp and Peter Gilstrap. A tunnel has been run below the old works encountering the vein, showing splendid ore.

Add Nevada Co.

BOSS.—*North San Juan Times*, Nov. 20: Work in the Boss mine is being pushed ahead quite vigorously at present. The company is now crosscutting and is taking out some very good rock. The hoisting is done with horse-power. The mill is now idle, all the rock having been crushed. The company proposes to mine about 500 tons of rock before the mill is started again. That amount of rock will run the mill about a month. A rich strike was made in the Delhi mine on Thursday of last week. We are informed that rock taken out of the pay chute assays \$75 per ton, and that there is plenty of it.

MINING NOTES.—James McCormick will work his claim, the Onondaga, on Boyle mountain this winter. C. F. Goering and A. G. Davis have leased the Idahoan and Wood River mines, on Boyle mountain. A. R. Dean and Walt Gooding have leased a property in Bassett gulch. The outlook generally for the winter's work is good. Six men

will be kept at work all winter in the Dollarhide mine, on Smoky. The King of the West will also be steadily improved and developed this winter. The Silver Star, of Smoky district, will work 10 or 12 men during the winter. The Carrie Leonard will work seven or eight men during the winter, mostly on dead-work. The Catharina, on Warm Spring creek, the Gillette, Culp and others, bid fair to become the most valuable mines in the district. At the bottom of the shaft the ledge gives signs of a rapid increase in width. The Mattie mine, on Trail creek, the property of J. B. Reiff and Geo. M. Snow, is showing well for this fall's work. The ledge is 17 inches in width, with seven inches of gray copper ore. Parties just returned from the Falls City mine, who have been doing the assessment work, report having made a rich strike. There is a ledge from six inches to a foot in width, with good prospects for rapidly increasing in size. The ledge is solid galena of high grade. The outlook for the mines in Wood River mining district is brighter now than it has been for some time. Every day we hear of fresh discoveries.

#### MONTANA.

MINING NOTES.—*Helena Independent*, Nov. 19: The Helena Concentrating Co., at the town named in its honor, is at the Cosmopolitan. He says the company is now handling more ore than ever before, and the output will be considerably increased with the completion of the railway to the town. Next spring will witness the beginning of shipment from seven or eight additional mines in that vicinity, besides a large increase in the capacity and output of the Helena works. Some idea of the extent to which the Helena Co. is now handling concentrates may be gained from the fact that the wear and tear on ore sacks per month is now about \$1000. The Lexington, of Butte, makes an official announcement that its net profits for the first six months of this year were \$80,000.

GRANITE.—*Helena Independent*, Nov. 19: The Granite Mountain Company estimate that upon the completion of their new mill, their average monthly output will be 240,000 ounces of silver and \$2500 in gold, besides the product of the extra high-grade ores which are shipped. By the methods employed by this company the average cost of mining and handling a ton of ore is \$18.44, and the average value of ore handled is nearly 177 ounces of silver. After the new mill is put in operation, however, the average value is expected to be reduced to about 125 ounces, as more second-class ore will be stoped.

A MINING PURCHASE.—Guy H. Brown and Barney Kelly have sold to Frank L. Sizer, superintendent of the Empire mine, the Puritan lode claim, adjoining the Empire on the south. The price paid was \$5000. It is to be presumed that Mr. Sizer buys in the interest of his company.

MINING NOTES.—Al Wilkinson has come down out of the mountains and says he has struck it rich in his location on the Little Jennie lode in the Red Mountain country. He says he has 14 inches of black sulphurets of silver assaying very rich. He has sunk a prospect shaft of 30 feet on the property. The tunnel on the North Granite at Phillipsburg is in about 50 feet, and is being pushed as fast as possible. West Granite is now regularly reported on 'change in St. Louis. It is selling actively at \$1.60.

#### NEW MEXICO.

THE GOLD CAMP.—*Cor. Idaho Statesman*, Nov. 18: After a period of some four years of inactivity, this mining region (Golden) is beginning to assume some appearance of its former life and excitement. The recent rich discoveries of gold and the valuable and easily worked placers, together with the mild climatic conditions which prevail, are proving effective inducements in attracting the mining population here. Many miners and experts are arriving almost daily from Colorado and the north, and express themselves in enthusiastic terms over the rich indications of gold everywhere apparent in this vicinity. Several representatives of Eastern banking firms are here with the idea of investing and developing promising claims. I can state on authority that financial parties in Boston, Chicago, and New York are much pleased over the indications here of gold deposits and are making interesting inquiries by mail and otherwise. One gentleman here from the East made the prediction that this region would receive an investment of capital and development within the next 18 months hitherto unknown in its history.

#### OREGON.

QUARTZ AND PLACER.—*Democratic Times*, Nov. 10: Miners are anxiously awaiting rain, the season proving quite unfavorable so far. Many quartz ledges are being prospected at present, and a rich strike may be expected at any time. C. W. Triplett, an experienced miner, will run S. Geer's placer claim on Grave creek during the coming season. T. H. Berryman is still at work in his drifting diggings on Applegate and taking out a considerable amount of dust. The miners of Grave, Wolf and Coyote creeks are ready for business, and will make a good report if the season is favorable. Blalock Bros. have their claim on Pleasant creek rigged up with hydraulic pipe and will make a good showing this season. Smith & Lynch have their placer diggings on Wagner creek ready for business. Alexander Watts' claim, on Josephine creek, is being fitted up with hydraulic pipe, and will be worked on scientific principles hereafter. J. Wimer & Sons have built a huge reservoir at the head of Butcher gulch, where they already have one giant at work and another in position. Work is still progressing at the tunnels of the Jacksonville Milling & Mining Co., and C. C. Beekman, in the Jackson creek district, with excellent prospects. Everything is in readiness at the Sterling mine for an extensive run, and a large amount of gold dust will no doubt be taken out there, as operations will take place in good ground. J. G. Birdsey and S. Mathis are busily engaged in getting their claims on Birdsey creek in running order. They have hydraulic pipe and a giant and propose working on an extensive scale. Brown & Co.'s mill, located near the Swinden ledge, has not got fairly under way as yet, some of the machinery not having been properly adjusted. In a few days it will be in good order, having commenced work yesterday. Operations have been suspended on the Hope ledge in the Wagner creek district, the ore not being of high enough

grade to pay for working it with the small mill in use. There is no doubt but what the mine would prove remunerative if a mill of sufficient capacity was employed. A cleanup was made at Klippel, Bauble & Co.'s mill on Shively gulch. We have not learned the exact result, but those interested seem to be satisfied with it. No doubt the mill can be kept supplied with quartz from that vicinity, in which event we think there can be no doubt of the success of the enterprise, as the ore seems to contain more or less gold and the mill seems to deal with it in a satisfactory manner. A subscriber of the *Times*, writing of the great strike in the Cow creek mining district, says that Rube Jones recently struck one of the finest pockets of quartz in his tunnel on the Green mountain ledge that has ever been found in this part of the country. At one single blast he blew out not less than \$5000 of the pure stuff. Rube went to Portland with 12 pounds of the rock, in which was not less than \$1500 and contained more than three-fourths (in weight) solid gold. There is no telling how much there is in the find. The tunnel has been locked up and guarded by two men. In the bottom of the hole where the blast was put in a vein of gold could be seen one and three-fourths inches wide and nine inches long, in the solid rock.

BIG SALE OF MINES.—*Bedrock Democrat*, Nov. 17: Last Tuesday Mr. C. C. Davidson purchased all the mines, with the exception of two in the Bonanza basin, about two miles west of Cornucopia. They were the Red Boy, Mountain Chief, Green Horn, Stella, Allie Walker, Queen of the West and Golden Chest; consideration, \$100,000. Mr. Davidson left this city Friday for Denver, Colorado, where he goes to secure two Burleigh drills and other machinery to be used in piercing the mountain and crosscutting all the veins in the basin. The mill-site formerly owned by Mr. G. W. Wilson was also included in the purchase. Mr. D. intends working this winter, and now has a force of men at work making a good winter road from Cornucopia to the mines. The future prosperity of Pine Creek is assured beyond a doubt, and next spring will find lively times in that vicinity.

#### UTAH.

REVIEW.—*Salt Lake Tribune*, Nov. 19: The week has been rather a dull one in mining circles, a dullness to which the snows and storms have largely contributed. The receipts of bullion and ore in this city for the week ending the 17th, inclusive, were as follows: Bullion, \$74,873.31; ore, \$88,497.44; total, \$163,364.75. For the week previous the receipts were \$126,280.73, of which \$71,054.16 was bullion, and \$55,226.57 in ore. The output of the Ontario for the week was 15,639.71 fine ounces, and \$23,810.24 for ore sales, three lots; an approximate total of \$39,449.95. The daily product for the week was 9635 ounces of fine bullion. Base bullion receipts during the week were \$16,500; fine bars, \$28,316.31. The Hanauer smelter produced during the week \$17,867 in bullion. Sprucemount bullion to the value of \$2600 came in on the 15th. Stormont silver bars came up from Silver Reef on the 15th, valued at \$2980. Ore receipts here for the week were \$23,970 by Wells, Fargo & Co.; \$17,380 by McCormick & Co., including \$5250 from the Crescent and \$3180 from the Queen of the Hills; and \$47,241.44 by T. R. Jones & Co.

SANDSTONE NOTES.—*Southern Utah Times*, Nov. 16: Thorne & Aurley shipped about 11 tons from Vanderbilt mine to River mill. Henry Holland shipped last week five tons of ore from Silver Gate mine to River mill. The Baily, Nesbit & Co., Leachers, made a good-sized shipment of sulphides last week. The Washington mine, owned by Huntley & Pendray, is to have a shaft sunk to tap the ledge. The Johns Barbee segregated ground on the Bonanza mine is turning out considerable fair-grade ore. At the Emma, 225 feet down, two crosscuts have been commenced, running north and south on the vein. The mine is looking very favorable. John Kimple has been driving a tunnel to connect with an old stope on the Leeds. Considerable low-grade ore was found, which is suitable for the Leachers but not for shipment. The Stormont Co.'s average shipment of ore from Buckeye and Thompson to River mill, for past week, was 37 tons per diem, and bullion shipment for last month was about 11,000 ounces. There is but little change to note in either mine; about 40 miners are employed, and the stopes continue to furnish about the same amount of ore. The mill is working steadily and the supply of ore is sufficient for her full capacity.

SANDSTONE NOTES.—*Southern Utah Times*, Nov. 8: The material for the Bayles & Holland leachers is being shipped to the mine. The mill companies are receiving very little chloride ore, the principal portion going to the leachers. It would be advantageous to capitalists if they would come here and invest some of their surplus capital in aiding those who are not in a position to push ahead with good claims. The Banner mine is looking very promising for the amount of work done. The shaft is down about 30 feet, no dead-work is being done, and but little waste is removed, as the width of the ore body is sufficiently large for working purposes. The Stormont Company's mill, which was closed down for a few days to make some repairs, has again dropped her stamps and is running to her full capacity. There is nothing new to report from the Buckeye and Thompson; the output for last week is similar to the previous week.

THE MOUNTAIN BELLE CLAIM.—*Salt Lake Tribune*, Nov. 20: S. W. Scott is down from Logan to spend a few days in the city. He is one of the pioneers of Paradise district, lying east of Brigham City, and 20 miles south of Logan. He has been engaged with his associates, J. E. Trehwala, T. S. Snarr and J. R. Edwards, in work on their Mountain Belle claim for about one year. Two shifts have been at work nearly all the time, and thus over \$4000 has been expended on development. The lower adit tunnel is in 286 feet, and when driven 40 or 50 feet farther is expected to tap the ledge at a depth of 170 feet. Their upper tunnel tapped the ledge 45 feet below the surface. In driving these tunnels they cut small stringers and have some ore on the dump. On the surface the ledge has been opened in three places. The upper tunnel crosscut the ledge 17 feet through ore and ledge matter, which assays from 15 to 65 ounces silver per ton. Mr. Scott says the ore is free milling, and that they will soon ship 10 tons to test it, and, if satisfactory, we may look for important improvements there. He looks upon the district as being very promising.

## THE FRISBEE-LUCOP MILL,

## A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.  
At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.  
All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.  
Certificates as to performance of the Mills, and any information required, furnished on application.

## THE FRISBEE-LUCOP MILL CO.,

Office, 104 & 106 Washington St., NEW YORK.  
OR PACIFIC IRON WORKS, SAN FRANCISCO.

HERCULES SLAYING THE GIANTS.

## HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

**No. 1 (XX) is the Strongest Explosive Known.**

**No. 2 is superior to any powder of that grade.**

PATENTED IN THE UNITED STATES PATENT OFFICE

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.  
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.  
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

## Let the Mineral Land be Preserved for the Miners.

EDITORS PRESS:—Your admirable article in issue of November 12th, with the above heading, is quite to the point, and should be followed up for the good of the people; but your earnest advice is not all that is needed. It requires more united action of the miners, that these lands shall be preserved. During the past summer I have traveled about all over the mining sections of Southern, Middle and Northern California, and, from one place to another, the mineral lands are being surveyed, claimed, and held and sworn to as being agricultural, and in some instances, where the individuals have made their oath, got their lands secured, have sold the same to be mined, and in others mined themselves. Such perjury as is being carried on as respects the mineral lands calls for some action on the part of the mining communities.

It seems to me that the "snap" has about oozed out of the miners of this State, or they would not stand this robbery of these mineral lands. As you, Mr. Editor, are aware, I have pressed attention of the miner for organization, by which all this wholesale grabbing of the mineral lands can be stopped. A quartz miner is allowed 1500 feet by 600 as his rights, but an agriculturist can grab 20 mines possibly in one 160-acre tract. Now, I do not see how some make their title stick, but some do, while others do not, and I would like to understand how this is. I know I am not alone in this loss of comprehension; and further, you could do no greater service to the miner than in following up this matter and enlightening him on the laws of this legitimate grabbing of the mineral lands. So much for that. As winter is at hand and the "old man" is to rest more, he is going to give you a scrap now and then.

OLD MAN OF THE MOUNTAINS,  
Angels Camp, Calaveras Co., Nov., 1886.

### Mining Share Market.

Mining stocks continue to "boom," the average business being very large at advancing prices. Mining stock circles received an additional source of excitement this week, in the news that Baldwin Gardiner, president of the Pacific Stock Exchange, had absconded with about \$100,000 of other people's money.

All the interest centers on Comstock shares, some of which have advanced very greatly in price. The shipment of \$100,000 from the Consolidated California and Virginia last week is an indication to many that these famous mines will again be profitable investments. In speaking of the ore on the 1435 and 1650 levels, the Virginia Chronicle says: By glancing at the back files of the Chronicle it is ascertained that the ore development in the north end of the mine, so far as explored, is over 350 feet in length and 450 in depth. The width disclosed by the crosscuts sent in, if definitely ascertained by the management, has not been made public. Information gathered from fairly reliable sources credit it with a breadth of eight sets of timbers on the 1300. This represents a total width of over 50 feet on that level.

The official report of an increase in the quality of ore on the 1435, developed by the sending in of an east crosscut on that level, indicates that the vein widens rapidly in its downward course, while the advance of the upraise above the 1650 level denotes an improvement in the grade of the ore at that depth over the levels above.

### Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. Virginia and California, Nov. 20, \$100,000; Lexington, 17, \$21,824; Silver Bow, 17, \$28,528; Alice, 17, \$55,480; Moulton, 17, \$17,600; Young America (for October), \$34,000; Hanauer, 16, \$4345; Sprucemont, 16, \$2600; Bannock, 16, \$6600; Stormont, 16, \$2900; Hanauer, 19, \$2290; Alice, 20, \$24,315; Hanauer, 21, \$2250; Bannock, 21, \$3500; Queen of the Hills, 17, \$1070; Wells, Fargo & Co. received at Salt Lake last week, \$58,680; McCormick & Co., \$47,437; and T. R. Jones & Co., \$47,241; a total of \$103,364. Last week's mineral shipments from Salt Lake were 18 cars bullion, 465,945 lbs; 11 cars ore, 332,350; 57 cars copper ore, 210,510; total, 36 cars, 1,008,805 lbs.

### New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

PHENIX CON. M. CO., Nov. 20. Capital stock \$3,500,000. Directors, Charles Webb Howard, A. Borel, Charles Mayne, George E. Herrick, R. S. Moore, Francis G. Newlands and W. H. Lawrence.

EAST BEST AND BELCHER M. CO. Nov. 20. Location, Nevada. Capital stock \$10,000,000. Directors, H. G. Sieberst, C. W. Beach, B. F. Dahl, C. H. Mason and J. J. E. Hawkins.

MIDDLE BAR G. M. CO., Nov. 23. Capital stock \$400,000 in 200,000 shares. Directors, Martin Jones, S. L. Theller, T. E. Jewell, W. B. Murdock and F. E. Luty.

### Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE project of the Santa Rosa & Benicia R. R. is being pushed with vigor. A meeting in its behalf, held at Santa Rosa on Monday, is reported large and enthusiastic. Forty-five thousand dollars had been subscribed in one week. Other meetings are announced elsewhere.

SMELTING WORKS for reducing ore are to be put up at Lower or Reading Springs, Shasta county.

## List of U. S. Patents for Pacific Coast Inventors.

From the official report of U. S. Patents in Drury & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING NOVEMBER 16, 1886.

- 352,849.—FLOW—John A. Ball, Grass Valley, Cal.
- 352,674.—REIN-GUARD—C. L. Bard, San Buenaventura, Cal.
- 352,675.—VEHICLE SPRING—E. Bowman, Santa Cruz, Cal.
- 352,732.—HYDRAULIC NOZZLE—J. H. Byrne, Nevada City, Cal.
- 352,527.—SIGNAL BUOY—T. Duffy, S. F.
- 352,744.—CAR COUPLING—S. J. Ford, Placerville, Cal.
- 352,685.—JOURNAL BEARING—Frank & Wicks, Pinal, A. T.
- 352,686.—BALING-PRESS—J. L. Gilbert, Lebanon, Ogn.
- 352,825.—STEAM BOILER—C. N. Hitchcock, Stockton, Cal.
- 352,695.—APPARATUS FOR TRANSFERRING LIQUIDS—Kenworthy, Sexton & Thompson, Colton, Cal.
- 352,544.—PROTECTING FRAMEWORK FOR LEVERS, ETC.—J. Kernaghan, S. F.
- 352,761.—CAR AXLE—E. E. Krengle, Buena Vista, Ogn.
- 352,891.—SKIRT-HOLDER AND RACK—F. M. Reynolds, Pinacate, Cal.
- 352,574.—STEAM ROAD-ROLLER—J. Scheerer, S. F.
- 352,578.—ORE CONCENTRATOR—S. W. Shaw, S. F.
- 352,719.—WINDOW-SASH HOLDER—H. W. R. Strong, Oakland, Cal.
- 352,896.—WATER HEATER—Swager & Fercher, Astoria, Or.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible, by mail or telegraphic order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR TRANSFERRING LIQUIDS.—J. T. Kenworthy, D. Sexton and Albert Thompson, Colton, San Bernardino county. No. 352,695. Dated Nov. 16, 1886. This is an apparatus for transferring liquids from one receptacle to another. It consists in a bellows provided with inlet and outlet ports and controlling valves, separate passages or tubes connected with the ports and separate pipe or hose connections from said tubes to the liquid in receptacles. The apparatus is mainly intended for racking wines or other liquors.

CAR-COUPLING.—Simeon J. Ford, Placerville. No. 352,744. Dated Nov. 16, 1886. This is one of that class of couplings in which a pivoted gravity-latch sustains the coupling-pin until forced back by the entering link, whereupon it releases the pin, so that it drops through the link, and thus couples the cars. The invention consists in an apertured gravity-latch pivoted in the upper front portion of the drawhead chamber and hanging down at a backward inclination within said chamber, said plate supporting the coupling-pin upon the edge of its aperture and adapted to relieve it when raised by the entering link. It consists, further, in connection with the gravity-latch, of a loose plate above and resting upon the latch-plate, and also apertured for the passage of the pin, said loose plate serving to more effectively clamp or bind the pin by its weight, and also to hold the link horizontal. This makes an automatic coupling.

WINDOW-SASH HOLDER.—Harriet W. R. Strong, Oakland. No. 352,719. Dated Nov. 16, 1886. This consists in opposing plates and an intervening thumb plate for expanding them, whereby they are caused to bind against the adjacent stiles of the two sashes and force said sashes to bind against the inner and outer beads. It further consists in the novel arrangement of the plates, in the construction and shape of the inner one, which is provided with a catch or lip on its lower end for engaging the under side of the meeting rail of the sash, and in an adjustable plate on said lip to secure the main plates to the sash when desired. The main object is to provide a fastening or holder for windows that will lock the two sashes when one or both are open for ventilation and will hold the window in that position. This is easily applied and is wholly independent of the sashes. It may be carried about by the owner when traveling or moving from place to place.

### Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

THE Plymouth quartz mine of Amador county has yielded \$447,547.30 for the nine months of the current year.

## Testing and Working Silver Ores

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroechnko's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by Dewey & Co., Publishers, 252 Market St.

## CALIFORNIA HAND ROCK DRILL,

—FOR—  
TUNNELING, DRIFTING,  
and SINKING.

Buy the best and latest improved Hand Rock Drill; can be run by hand, steam, compressed air, or water power. Machine made entirely of crucible steel; light, compact and durable. Strikes 250 blows per minute with 7-lb. hammer. A perfect reproduction of hand drilling; will drill one inch per minute in the hardest rock, using one-quarter the number of drills required by hand labor.

Machines on exhibition at No. 32 First St., San Francisco.

Send for circulars.

GEO. T. EMERY, General Agent.

L. C. MARSHUTZ.

T. G. CANTRELL.

## NATIONAL IRON WORKS

N. W. Corner Main and Howard Sts., San Francisco,

—MANUFACTURERS OF—

Stationary and Compound Engines, Flour, Sugar, Saw and Quartz Mill Machinery.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description.

ALL WORK TESTED AND GUARANTEED.

IMPROVED PORTABLE HOISTING ENGINES.

## NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 8 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

## Assessment Notices.

**Tallulah Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Sierra Mining District, Humboldt county, Nevada.

NOTICE is hereby given, that at a meeting of the Directors, held on the 30th day of October, 1886, an assessment (No. 21) of thirty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 634 Market street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 31st day of December, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Wednesday, the 29th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEORGE A. HILL, Secretary.  
OFFICE—With Estate of Samuel Hill, 634 Market St., San Francisco, Cal.

**Acme Mill and Mining Company.**—Location of principal place of business, San Francisco, Cal. Location of works, Volcano Mining District, Amador County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 25th day of October, 1886, an assessment (No. 9) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Sec'y.

OFFICE—Room 4, 309 California St., San Francisco, Cal.

**Aultman Mill and Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Georgetown Mining District, El Dorado County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 26th day of October, 1886, an assessment (No. 3) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Sec'y.

OFFICE—Room 4, 309 California St., San Francisco, Cal.

**Santa Annita Mill and Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Nevada County, Cal.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 26th day of October, 1886, an assessment (No. 10) of one and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 29th day of November, 1886, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. ## RISDON IRON &amp; LOCOMOTIVE WORKS.

LOCATION OF WORKS:

S. E. Cor. BEALE and HOWARD STS., SAN FRANCISCO.

Manufacturers and Sole Agents for the Pacific Coast for

## HEINE SAFETY WATER TUBE BOILER.

HAS THE FOLLOWING ADVANTAGES:

SAFETY,  
DURABILITY,  
ECONOMY,  
AND

Facility of Inspection and Repairs.

60,000

HORSE POWER NOW IN USE.

Boilers can be seen working in San Francisco at Palace Hotel, Spring Valley Water Works, Hueter Bros. & Co., California Jute Mills, and other places.

GUARANTEED MORE EFFICIENT than any other Boiler made.

HEINE SAFETY WATER TUBE BOILER.

Also Manufacturers and Sole Agents for the Pacific Coast for

## MACBETH'S PATENT PULLEYS.

STEEL RIMS,

WROUGHT IRON ARMS,

LIGHTEST, STRONGEST AND

BEST PULLEY IN THE MARKET.

HALF THE WEIGHT OF CAST-IRON.

Accurately Balanced.

Cannot be Broken in Transportation.

MACBETH'S PATENT PULLEY.

Sole Agents Pacific Coast for

## FOX'S CORRUGATED FURNACE FLUES,

For BOTH LAND & MARINE BOILERS.

Rapidly Replacing Old Style.

Over 10,000 now in use. Have just fitted 12 furnaces in Oceanic S. S. Co.'s Steamer Zealandia. Send for Circular of comparative tests.

FOX'S CORRUGATED BOILER FLUES.

## BUILDERS OF

QUARTZ MILLS—Gold and Silver, Copper and Lead Smelting Works, Roasting Furnaces of all kinds.

AIR COMPRESSORS—Rope Power Transmission.

HYDRAULIC PUMPING and Hoisting Machinery.

WROUGHT-IRON WATER PIPE a Specialty. Note.—Have just completed order for 35 miles of 44-inch pipe of 1-inch iron for Spring Valley Water Works Company, San Francisco.

SAW-MILL MACHINERY of all kinds.

STEAM ENGINES—Corliss, Slide-Valve, Poppet Valve Automatic, Single, and Compound.

SOLE MANUFACTURERS for Pacific Coast of the Celebrated "Heine" Patent Safety Boiler (Water Tube); 50,000 horse power now in use.

MACBETH PATENT STEEL-RIM PULLEYS—Fifty per cent lighter and 25 per cent cheaper than cast-iron pulleys; will not break in transportation.

REFRIGERATING MACHINERY for Steamships, Breweries, and Cellars.

WILSON'S PATENT GAS-PRODUCER.

STEAM BOILERS of all descriptions.

SUGAR MACHINERY—Sugar Mills, Vacuum Pans, Clarifiers, Double Effects, etc.

STEAMSHIPS—Steam Yachts, Marine Engines and Boilers, Screw Propellers, Centrifugal Pumps, Steamship Pumps, Steam Capstans, Cargo Winches, etc.

Builders of 120-stamp Gold Mill for the Alaska Mill and Mining Company; 60-stamp Mill for Quartz Mountain Mining Company.

Send for Circular and Price Lists.

## Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

**RUPTURE!**  
A New Invention! The "Perfection" Belt Truss, with Universal Joint Movement and Self-adjusting Spiral Spring. Worn with perfect comfort and safety. Gives universal satisfaction. Price, from \$3 to \$6. Call or send for descriptive circular. Address, J. H. WIDBER, (Druggist) 701 Market Street, cor. Third, San Francisco.

**HEALD'S BUSINESS COLLEGE,**  
24 Post St. S. F.  
Send for Circular.

## Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, coin, postage free. Sold by Dewey & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by Dewey & Co., S. F.

**DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY** is the oldest established and most successful on the Pacific Coast. No. 252 Market St. Elevator 12 Front St., S. F.

Quartz Mill Screens a Specialty.

147 Beale Street, San Francisco.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold  
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.  
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting  
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,  
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded  
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-  
ties to suit purchasers.

**BALFOUR, GUTHRIE & CO.,**  
316 California St., San Francisco.

## FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

### WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH of the YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES THE BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

### BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

## IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

**BEST SOFT LAKE SUPERIOR COPPER USED.**

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

**SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.**

**E. G. DENNISTON, Proprietor.**

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these rock plates cost.

## DEWEY & CO.'S

Scientific Press

Patent Agency.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

## Mining at Benton, Mono County.

A Chicago company, which now owns the Silver Bell mine, at Benton, Mono county, is about to do some important work on that mine. The mine is on Blind Spring Hill, three miles east of Benton, between the Kerrick mine and the Little Emily Company's ground, the latter now owned by John B. Farwell and his friends, of Chicago. The Kerrick mine has yielded, it is stated, \$1,500,000. At one place the Silver Bell has a large "blow-out" on the croppings 150 feet wide, caused by a cross winze from the famous Comanche lode, out of which the miners took \$6,000,000.

The last-named lode runs parallel with the Diana and Kerrick lodes, and the Comanche shaft is down 750 feet, running into the Diana and Kerrick lodes, midway in the Silver Bell's ground, which causes the large "blow-out." The Comanche ore is of the same character as the Diana, Kerrick and Silver Bell's, assaying from \$50 to \$1500 per ton. They used to pay \$100 per ton to ship it to San Francisco.

The object of the Silver Bell Mining Company is to run a tunnel in 300 feet under the "blow-out" to tap the lode 300 feet below the croppings. That will save cutting a new wagon road a mile to get to the works, and save 50 cents per ton in transportation of the ore to the railroad or to the mill. The expense of cutting a new road is great, and the saving of 50 cents per ton of the ore for transportation will, it is thought, soon pay for running the tunnel, and the tunnel will save the distance in carting the ore fully one mile. They have ore in several places along the lode on the surface, and this tunnel will take it all out of the high hill to advantage.

The Little Emily (Farwell's mine), of 3000 feet in length, joins on to the north of the Silver Bell, on the same lode as the former mines, and has yielded \$2,000,000. They are taking out ore now two-thirds of the way north of the ground from their south boundary line that joins on to the Silver Bell property. Those mines are 800 feet deep, worked by tunnel and worked cheap, consisting of the same character of ore as the Diana, Kerrick, Comanche and our Silver Bell.

The cost of hauling to railroad is \$3.50 per ton; freight charges to Reno, Nev., \$6 per ton. At Reno the ore can be reduced for \$14 per ton. W. H. Russell is now superintendent of the Little Emily, and it is from a report by him to the secretary of the company in Chicago, Henry Meiselbar, that we glean these points.

A DISPATCH from Benson, Arizona, says: Several prospectors have arrived in this territory, and are looking around with a view of working some of our valuable mines. Indian trouble being at an end, capitalists are coming here to plant their surplus capital. A large number of cars from Fairbank have reached Benson loaded with ore and concentrators destined to Vallejo Junction, California. Copper matte has passed here from points on the New Mexico & Arizona railroad consigned to Liverpool, England.

The average assays of the ore sent to the mills from the Consolidated California and Virginia mine for the three weeks ending on Nov. 27th were \$36.67, \$44.22 and \$42.17 per ton, respectively. The mills are handling about 2800 tons per week.

## Gold-Saving Appliances.

Mr. Bryan Tyson, formerly of this city but now of Washington, D. C., has improved his gold-saving and concentrating appliances materially since leaving California. When here he took out some \$3000 in gold at claims where it had passed by the approved works of the day, but at that time his invention lacked much of meeting the requirements. He now has ten patents, with six pending at the Patent Department.

Mr. Tyson writes us that he has engaged a body of tailings near Sheridan, Montana, that

UNDER-BEAM COMPOUND PUMPING ENGINE.

aggregate about 15,000 tons. The ore was originally worked by the copper-plate process only. He thinks these tailings will average \$20 per ton in gold, and his combined amalgamator and concentrator will work from 40 to 50 tons per day. It is his opinion that, after paying royalty, a profit of \$75,000 will be made in two years. The plant to work them will cost only about \$2500, on Mr. Tyson's plan, and he is now endeavoring to procure assistance to construct it.

Mr. Tyson places his gold-saving appliances a short distance down the sluice, below the amalgamating plates. The grooved riffles in connection with silvered plates take up but little space and can be readily locked up. The double-acting concentrator is cheaply made and of large capacity.

THE coal discovered last season on Queen Charlotte islands by Robertson and Shields is said to be the best yet found on the Pacific Coast. A seam 18 feet thick has been developed sufficiently to convince the owners that it is practically inexhaustible.

THE Salt Lake Tribune says the finding of coking coal in Colorado has practically stopped the smelting of ores in Omaha.

## Germanium.

Some months ago the discovery of a new element, named Germanium, was announced, a preliminary notice of which has already appeared in the PRESS. The discoverer, Dr. Winkler, has since been able to make a more systematic examination of the subject, and he now describes in detail the preparation and properties of the new element and also of a number of its compounds.

The new element occurs in the recently-discovered mineral, argyrodite.

Its isolation is, however, difficult, especially

## An Under-Beam Compound Pumping Engine.

There are many forms of pumping engines for working on the Cornish pumping system. The single and double-gear engines are very common. The direct-acting engines are also made in a variety of ways, and connect directly to the main bob through which the line of rods actuate the pumps. The engraving on this page shows a direct-acting compound pumping engine, with O'Neill's rotative valve-motion and cut-off. This style of under-beam engine is made by the Union Iron Works of this city.

In this design, the cylinders are placed side by side, on a heavy bed-plate, and to the bottom of this is bolted the guide-plates for the cross-heads. The cross-heads are made of wrought-iron. The steam-chests are cast separate, and bolted to the cylinders. The connecting-rods of each engine are connected directly to one end of the beam. The initial engine, being on the outside, has a longer stroke and greater piston speed than the expansion engine, which is placed nearer the center of the beam. The beam is made of cast-iron, of design shown in engraving, and is securely "tied" together with wrought-iron straps and keys. The angle arm is made forked, to admit of the main connecting-rod working in the center, and on a heavy steel pin placed in the beam, the main pump-rod is attached, as shown. The main connecting-rod connects from the angle arm of the beam to a wrought-iron crank and shaft. On this shaft is placed the fly-wheel. By this arrangement, uniformity of speed and length of stroke are obtained. The valve motion is derived from a shaft running at right angles to the crank-shaft and operated by a miter-gear placed thereon. On this shaft is placed the main and cut-off eccentrics, and they, in turn, by rods, rock-shafts and levers, give the proper motion to the valve-gearing. This engine is fitted with jet condenser, and independent bucket-plunger air-pump. Several sizes of this form of engine are made by the Union Works.

PATENTS FOR MINING CLAIMS.—Secretary Lamar has written a letter to Commissioner Sparks, of the General Land Office, that will reverse the practice of that bureau in issuing patents for mining claims. It has been the practice of the department, in granting patents covering lode mining claims that interfere with townsite claims, to give the surface improvements and betterments to the townsite claimants. In the case of Deffenback vs. Hawk, the Supreme Court decided that the fee simple to the ground was indivisible, and included the surface as well as subterranean possessions. On October 25th Commissioner Sparks addressed a letter to Secretary Lamar stating the practice of the department, citing the decision of the court and asking for instructions. The secretary replies that the decision of the court must be followed and conveyances made accordingly in lode claims, including surface improvements.

THE Sierra County Tribune says: Who dare assert that mining is unprofitable in view of the following figures? Sierra Buttes mine, of Sierra City, has paid to its stockholders dividends of over \$2,475,000 since 1872. The Plumas Eureka has paid over \$1,900,000 in dividends since its purchase by its present owners. Both of these mines are owned by the same company.

W. J. CHAPPELLE, who was in Leadville, Colorado, recently, speaks of it as one of the liveliest places in America, owing to the recent new and immensely rich discovery of extensive deposits of carbonate ores. Its present prosperity exceeds its past.

THE total lead bullion product of the State of Colorado from January 1 to July 1 1886, was about 30,000 tons.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

## Nogales, Arizona.

EDITORS PRESS:—Your mention of my name in connection with the statement that business has not improved here since the capture of Geronimo, or the publication of the statement, was rather unfortunate. My letter was not intended for publication; the "business" spoken of was my own business of assaying, which, to the surprise of everybody, in the month of October actually fell below the average of the preceding year.

Several of our citizens tell me that they note a distinct improvement since the removal of the hostiles; it is certain that many prospectors are out, and a gentleman recently from Hermosillo tells me that city is full of Americans looking for mining investments in Sonora. The prosperity of Sonora means prosperity in Nogales.

My mention of Geronimo was half in jest, as I have more than once proposed, in jest, to petition for his restoration. Far be it from me to disparage the efforts or the success of Gen. Miles and his officers; it is too soon, as yet, to look for complete recovery from the effects of that blighting incubus from which those able soldiers have so effectually relieved us, but recovery will come, is coming, and our gratitude will not be lessened by the fact that many of us at one time doubted the ability of the army to cope with the wily savage on his own ground, with our arms in his hands. I do not write this because I am myself a resident and property-owner in this village; my individual interests are comparatively unimportant, and I do not indulge in the very rose-colored view of our future entertained by some. I write in justice to others, and to correct a false impression, which might be produced by the previously published statement, motives which, I am convinced, will insure a suitable response on your part.

C. H. AARON.

Nogales, Nov. 23, 1886.

## Sierra City Mines.

EDITORS PRESS:—The Bocant quartz mine is situated in Ladies' canyon, one mile south of the famous Primrose, and in the Sierra Batte belt or range. Two men have been doing the work in sinking a prospect shaft on the Bocant for the last month. The lode crops out boldly the entire length of 1500 feet, and prospects fine gold in the mortar all along. The rock in the shaft shows free gold wherever tested, some of the quartz being quite rich, and even the dirt will pay for working in a mill. There is timber in abundance, and water sufficient for a mill of any capacity. This property is owned by D. P. Stewart and others.

The Ilda Bell joins the Bocant on the south, and is owned by D. P. Stewart and Wm. Glidden. This is a well-defined lode for 1200 feet, the full length of the claim. A small shaft is being sunk, the quartz in which prospects well in free gold. The mine has the same advantages for working as those of the other one mentioned. Parties are trying to get a bond on these claims with the view of opening them up to good-paying properties.

E.

Sierra City, Sierra Co., Nov. 26.

A BAD PRACTICE.—One or two experts and several miners have complained of persons said to be in Prescott who make it their business to lie concerning the merits of mining properties which they (the liars) have not the "control" of. A gentleman called at this office Saturday last and told us of an instance where, he said, blackmailers prevented capitalists from investing in mines and working them. He was an operative miner. Yesterday an expert called and astonished us by stating that but for these blackmailers he would now be working a group of mines on the Hassayampa and putting up two mills. He says he has control of good, large gold-bearing veins. Some one, who failed to get his fists in, wrote lying letters about the mines. The investors got scared, and Arizona's development is retarded by the so-called blackmailers, who ought not to be permitted to remain among us and keep those who can do something from doing it.—*Prescott (Arizona) Courier*.

A PRACTICAL LESSON IN METALLURGY.—Says the *Virginia Chronicle* of last Tuesday: The senior class of the Virginia High School, accompanied by Principal Bray, visited the Con. Virginia assay office this afternoon on an invitation of Mr. Frank Fielding, chief assayer. The class witnessed the melting of three bars of bullion, valued at about \$5000 each, and had the process of refining crude bullion carefully explained and illustrated for them—also the process of humid and fire assays. Mr. Fielding also explained to the class the operations of his electrical clock alarm and blow-pipe apparatus. In all of these matters the pupils showed great interest, and no doubt learned more in an hour and a half than they could have learned by study in several days. Mr. Fielding was obliging and courteous throughout, and received the warm thanks of the principal and class for his kindness.

## Fresno County Mines.

## A Rich Mineral Section Long Neglected.

For many years it has been known to a limited number of prospectors that Fresno county contains rich veins of gold-bearing quartz. The miners who have followed their avocation in this county have until late years devoted all their energies to washing the precious metal from the gravel in the beds of the streams, or in the mountain gulches where the winter rains afforded sufficient water for placer mining during a few months of each year.

Placer mining, says the *Fresno Republican*, saw its palmiest days in this county about 20 years ago, although it has since been and is yet carried on to a considerable extent along the San Joaquin and its numerous small tributaries. This branch of mining is almost wholly monopolized by the Chinese at present, however. Lying north of the San Joaquin, and extending through the foothills of the Sierra Nevada Range to the northern line of the county, is a section of country richly studded with veins of gold and silver bearing quartz, some of which have been sufficiently developed to prove their great richness, while others have been found with most promising surface indications, but they are as yet wholly undeveloped. Some mines are being worked extensively and with the best results. Several very lively mining camps are in existence, and new districts are being organized with a frequency that indicates a very heavy influx of miners and prospectors.

About 20 miles north of this city is the Long Gold mining district, in which are situated some of the best developed mines in Fresno county. The Hildreth mine is one of the oldest properties, but on account of the death of the owner it has been shut down for some time. This mine has been bonded by a party of San Francisco capitalists, who have organized with a capital stock of \$10,000,000. John Sevenoaks has been given the responsible position of superintendent, and is now making extensive preparations to thoroughly test the claim, and this proving satisfactory, to push the work of taking out and crushing ore.

The most noted mine in the district at present is the McNally, or Old Abbey mine. About one year ago this property was purchased by Geo. W. Grayson, Joseph Pfeiffer and John McNally, the latter a thorough miner. The price paid was \$23,000, or about one-twentieth as much as it could be sold for today. The firm spent fully \$80,000 in developing the claim, putting up a mill, hoisting works, etc. A shaft is now down 550 feet, and will be continued to 600 feet, while there are cross drifts extending 300 feet from the shaft. Drifting is now going on at a depth of 500 feet. The pay-roll at this mine embraces 54 men, about one-half of whom are practical miners. No definite information can be obtained of the amount of bullion being shipped from this mine, but it must certainly run considerably over \$10,000 per month.

Jesse Morrow has a very promising claim in this district which he expects to develop in the near future.

The claim located by James and McGinley last spring has been bonded by a company, and sufficient development has been made to insure the sale.

North of the Hildreth camp is a mine owned by a Mr. Wilson, for which the sum of \$15,000 was recently refused. This mine will, in the near future, be known among the best paying mines in the county.

F. Knoblock owns a good claim just to the northward of the Wilson mine.

Next in line comes the Mountain View, formerly known as the Harris and Hoxie mine. It is located on upper Fine Gold, near Mrs. Waggoner's hotel, and eight miles above the McNally mine. This mine was worked quite extensively some years ago, but was shut down on account of some disagreement among the owners. In June last, P. B. Donahoo bonded the mine for a sum understood to be between \$25,000 and \$30,000. He associated with him M. J. Donahoo and Thos. R. Brown, and recently Mr. Brown disposed of one-half of his interest to his partner in the hotel business, J. N. Albin. P. B. Donahoo has had personal supervision of the mine, and has kept five or six men at work continuously. His family has been at the mine with him, and from the way in which Pete gave our reporter the slip we are satisfied he has a bonanza. From one of his men we learn that they have a shaft down 150 feet, have a four-foot ledge, and are confident that they have the boss gold mine of the State.

Wm. Robertson owns a claim adjoining the Mountain View mine, which he has bonded to "Bony" Appling.

Next comes the American Flag mine, owned by George Lawson, P. LeBlanc, Tex. Baker and H. Ranscher. The first-named gentleman furnished the means for the latter two to do the prospecting, and the four are now equal partners in what promises to be a mine of more than ordinary richness. They have a shaft down 120 feet, developing a good ledge of ore. The White Rock, or Old Hampton mine, has been bonded from Wash Chapman by Grayson and Pfeiffer. The latter gentlemen have up hoisting works and are taking out some very fine sulphuret ore.

McKenzie and Rule are working the Last Chance mine, one of the best-paying properties in the county. They have a 10-stamp mill which they keep running night and day upon

ore milling about \$60 per ton. A drift has been run in on the ledge nearly 400 feet, no shafting being necessary. The vein of quartz is six feet in width and is rich in free gold.

The Quartz Mountain Mining Company has resumed work after a season of several months' idleness. The main shaft has been freed of water and will be sunk deeper at once, and crosscuts will be driven at different depths for the purpose of learning the extent of the ore body, which appears to be a massive body instead of a well-defined vein. French capitalists are working this mine, and have the most extensive plant of any company now operating in this section.

Adjoining the Last Chance is the Nat Harbert mine, which the McDonald Brothers have bonded and are developing with satisfactory results.

In Coarse Gold district the Texas Flat mine is now being worked extensively. Geo. Hearst and J. B. Haggin bought this mine some months ago and are developing it regardless of expense. They will never lose any money upon their investment, however.

Lang's mine is next in line, and is worthy of special mention. Lang & McClellan have a five-stamp mill running on ore taken from this mine, which, in addition to carrying free gold in amounts ranging from \$20 to \$40 per ton, also yields sulphurets worth from \$400 to \$600 per ton.

P. B. Donahoo and Thos. R. Brown have a claim adjoining the Lang mine which they have partially prospected.

The Butterfly mine lies further to the northwest, and is good property. It is under bond to A. W. Poole, ex-United States Marshal for California.

The McDonald mine, recently sold to Col. Ewing for \$60,000, comes next. Systematic work is going on here with paying results. The mine is equipped with a 10-stamp mill, hoisting works, etc., complete.

Near the McDonald mine is the Gambetta, also equipped with a quartz mill, etc.

A number of very promising claims are being developed in this vicinity, among which are the Red Rover, the King Gulch and others.

Next comes the famous Fresno Enterprise mine, which once changed hands for the sum of \$250,000, and was cheap at that price. Several moderate-sized fortunes have been taken from it already, and there is yet a very large future to hear from. A large force is now employed here, and the Fresno Enterprise is nobly keeping up its old time reputation as a gold producer.

Near here is also the Lucky Bill mine, owned by Oxendine, Crane & Baker. Whenever they desire a little spending money they dig out a few tons of ore, haul it to the Enterprise mill and have the gold extracted. The ore from the Lucky Bill mills at \$80 to \$100 per ton in free gold.

The Mt. Raymond district is too remote to admit of a visit with any degree of comfort at this season of the year, but will in the near future take its place at the head of the procession as the greatest silver-producing district of the world. The metal is there in abundance, and as soon as the little game of freeze-out, now being played by the wealthy owners against their poorer companions, is over, activity will begin. To those who have claims there we only advise them to "stay with the pot."

THE OUTLOOK FOR MINING.—We believe the tide is again turning toward mining. The Eastern papers no longer make stale jokes to the effect that men offering mining property are being kicked out of business houses. Railroad stocks have not paid much of late; in the farming regions people only make a living; there is much depression in all the manufacturing centers, except where railroad material is being prepared, and through all, men see the steady flow of bullion from the West and begin to realize that there must be something to mining, after all. Then, too, all the Eastern men who have bought mining properties legitimately; who have used the same care and taken the same precautions that men do in making ordinary investments, have done well—better than their neighbors have, who have clung to the usual channels of business; while some who have invested merely as a lark or gamble have made more money in 18 months than they had before through 40 years of patient exertion. Their neighbors, who were too cautious to invest, feel in their hearts a little self-reproach which they would fain satisfy by finding something to invest in which held a promise of a reward behind it. There never were so many men making inquiries for mines as there are right now. And never were there so many men anxious for developed properties. This ought to be a hint to miners. If they have not money to erect machinery, and if their ores are not of a kind or are not in the right place to dispose of to advantage, they ought to develop them with all their might and have them ready for inspection when experts come around.—*Salt Lake Tribune*.

CAOUTCHOUC FROM A EUROPEAN HERB.—According to the *Bulletin de la Société Chimique de Paris*, a plant belonging to the lettuce tribe, scientifically known as *Soachus oleraceus*, and quite common on the wayside and among dry rubbish heaps in France, has been found to yield a very good quality of caoutchouc. The plants are steeped in carbon bisulphide, and afterward boiled in alcohol and caustic potash. About 4.3 per cent of the weight is thus obtained as caoutchouc.

## The Minting of Gold and Silver.\*

NUMBER 4.

[By ALBERT WILLIAMS, JR.]

## Assayer's Department, Carson Mint.

The assayer's department is on the second floor, at the south end of the main building, and extends from the front to the rear. It comprises five rooms—office, laboratory, fire-assay room, volumetric test-room, and charcoal store-room. The force consists of the assayer, assistant assayer, humid assayer, cupeller and dissolver, and clerk.

Assay scales.—Two fine Oertling balances, costing \$350 each, are in use. The working delicacy of these scales is 1-20 milligram, but by subdividing the beam-rider spaces a delicacy of 1-40 milligram is attainable.

Sampling.—The system of sampling the bullion in the deposit-melting room has already been described. In sampling the assay bars of mint-fine metal from the ingot-melting room, the practice is as follows: For gold, one inside chip, averaging 0.35 ounce in weight, is taken from each of the 10-ounce top and bottom assay bars (which have been stamped "1" and "2" respectively); for silver, one inside chip, averaging also 0.35 ounce, is taken from each 6 or 8-ounce assay bar.

System of assaying.—It is hardly necessary for the purposes of this chapter to enter into details familiar to most readers. The fire assay is used: a, in testing purchases and deposits; b, mint-fine gold; c, standard gold ingots; and occasionally, d, as a check upon the humid or volumetric method. The volumetric system of Gay-Lussac (precipitation by normal solution of sodium chloride) is employed with (a) mint-fine silver and (b) standard silver ingots. As applied at the Carson mint, the humid method gives 1-10 of 0.001 in fineness, and the assayer's reports are in tenths of thousandths. The readings in the volumetric test-room are compared against a black screen, which is hung in front of the window.

Apparatus and machines.—The assay plant includes: A muffle furnace in the fire-assay room. It has a soapstone front and three muffle doors. An ore-assay furnace in the same room, 13 by 13 inches, and similar to the small furnace in the deposit-melting room. This furnace holds six assay crucibles. Sand bath in the same room. A condensing apparatus, consisting of a steam-coil condenser, having a capacity of 100 gallons in eight hours. As before stated, the water supplied to the mint is very pure, being from mountain streams. It contains hardly a trace of chlorine, but has a little lime, and for ordinary purposes does not need to be distilled. The main use of the condenser is to supply water for the humid assay of silver. Two pairs of small power rolls made of chilled cast steel, one of which is used in rolling assay lead and the other for gold and silver. These are alike, and are 2½ inches in diameter and 4 inches face. A shaking machine for agitating the precipitating bottles used in the humid assay. It holds 12 precipitating bottles. The vibrations are vertical and extend 2½ inches, and the speed is 240 strokes per minute. This machine is driven by a rawhide band from a 4-horse power engine.

## Miscellaneous.

Motive Power.—Boilers.—The boiler-room is on the ground floor of the extension, in the rear of the main building. There are two horizontal, plain flue boilers, each 16 feet long and 54 inches in diameter, and having 52 flues 3½ inches in diameter. The total grate area is 38 square feet, the grate being 9 feet 6 inches across the front of the pair of boilers and 4 feet deep. The grate bars are 8 inches wide, 4 feet long, and three-quarters of an inch thick, and are stiffened with vertical ribs 6 inches deep. The bars run lengthwise with the boilers, and are perforated with holes half an inch square at the top and five-eighths of an inch square at the under surface, these openings being arranged in rows of three lines of holes half an inch apart and 2 inches between each set of three lines. The fuel is yellow pine, in 4-foot sticks, and the consumption of wood is 1½ cords per eight-hour shift. Feed-water is supplied at 180° F. The pressure averages 70 pounds. Steam is sent from these boilers to the main engine and the small engine and condensing apparatus in the assay department, and is also used in the refinery for heating the precipitating vats in the whitening and annealing rooms and for various purposes.

Engines.—The main engine is of the Gardiner slide-valve type. The cylinder is 14 inches in diameter, with 36-inch stroke. The speed is 52 strokes per minute when the presses are running, and 54 with the rolls alone. The working horse-power ranges from 45 to 75, according to the number of machines driven. The fly-wheel is 12 feet in diameter, and is in eight sections. The rim is 8 inches deep and 3½ inches wide; its total weight is 5206 pounds. The main shaft is 8 inches diameter and 8 feet long; the driving pulley 8 feet diameter and 16 inches face. The main driving belt is known as a "75-horse power." There are 14 principal counter-shafts. The small vertical engine in the assay department has a 4x8-inch cylinder, and is rated at 4 horse-power. It drives two pairs of assay rolls and the shaking machine used in

\*From the census report on the "Statistics and Technology of the Precious Metals," by S. F. Emmons and G. F. Becker, special agents. The description of the mints and the processes applies to the year 1881, at which time the mints were examined.

the humid test, and runs from three to seven hours per day.

**Loss of precious metals—Flue-dust.**—The main stack of the mint is of common brick, 80 feet high, and has a single plain flue, which is circular in cross-section and 4 feet diameter. The addition of dust-chambers would effect a saving which would undoubtedly cover their expense. At the foot of the stack is a man-way, for access in cleaning, provided with an iron door. It has been the custom to clean out the flue at the close of each fiscal year. In 1880 no such cleanup was made, as the mint had been executing comparatively little work. The stack cleanup in June, 1879, produced 2 ounces of fine gold and 80 ounces of fine silver. This was less than the average for the preceding years. The amount of gold and silver which actually escapes through the stack cannot be accurately determined.

**Loss in melting and refining.**—The greater part of the total loss occurs in these operations. Each particle of metal is melted at least three times, exclusive of the clippings, which undergo a constant cycle of manipulations, so that it is possible to conceive of certain particles being remelted indefinitely. At each melting there is a small loss by volatilization, which it is endeavored to avoid by covering the surface of the melt with powdered charcoal. The legal tolerance of wastage is  $1\frac{1}{2}$  ounces of silver in every 1000 ounces of fine metal treated and 1 ounce of gold in each 1000 ounces of fine gold handled. The actual loss in the melter and refiner's department, as compared with the legal allowance on the quantity of bullion refined, is shown in the following table, from which it appears that the working results have been kept well within the authorized limits:

LOSSES OF GOLD AND SILVER IN MELTING AND REFINING AT THE CARSON MINT.

PERIOD.	GOLD.		SILVER.	
	Legal tolerance.	Actual loss.	Legal tolerance.	Actual loss.
	Ozs.	Ozs.	Ozs.	Ozs.
Fiscal year ending June 30, 1878.....	90	18	6000	700
Fiscal year ending June 30, 1879.....	39	33	4500	830
Fiscal year ending June 30, 1880.....	35	6	1304	135

The total wastage during the fiscal year ending June 30, 1880, at this mint was as follows:

Melter and refiner's gold wastage.....	\$124 50
Coiner's gold wastage.....	45 51
Melter and refiner's silver wastage.....	157 47
Coiner's silver wastage.....	149 13
Total.....	\$476 66

#### Tempering Dies and Collars.

The dies and collars of the coining presses require a high temper, which is attained in this mint by careful heating in a special furnace and instantaneous cooling in an apparatus of peculiar construction. The furnace has a cast-iron shell lined with fire-brick, is 24 by 20 inches, and has a grate area 15 inches square. The fuel is nut-pine charcoal. Four dies or collars are heated simultaneously, the length of exposure being one hour. The quenching vat is made of 3-16 inch wrought iron, is 26½ inches long, 18 inches wide and 18 inches deep, and has a close-fitting hinged iron cover. The dies or collars are not immersed directly in water, but are placed in a brass holder, through which, after the article to be tempered has been clamped in place, a powerful stream of cold water is passed. These holders are of two sizes, one for quenching dies and a larger size for collars. They are made in two parts, with a screw-clamp for securing the die or collar, and are provided with a screw socket, which fits upon the threaded head of a water pipe. The mode of application is as follows: The heated die or collar having been clamped in the machine, the latter is screwed upon the pipe and the lid of the vat is closed, these operations being performed in a moment. The stream is then turned on and plays upon the face of the die or collar, rapidly and uniformly chilling the steel by the constant impact of fresh portions of the water. The pipe is two and one-half inches in diameter, and the head is 100 pounds per square inch. The water is allowed to run three minutes, at the expiration of which time the holder is unscrewed and the tempered die or collar is removed and dried.

#### Dressing the Rolls.

The grinding-room is in the front part of the basement. Here the rolls are ground true when their faces have become irregularly worn. This is done by means of a grinding lathe, which has a solid emery wheel 22 inches in diameter and 1½ inches face and runs at a speed of 800 revolutions per minute. The machine requires 8-horse power. A very light pressure is used. The dressing was formerly done by a grindstone, which gave equally good results, but worked very slowly. The emery wheel accomplishes, in one and a half hours, work which requires 24 hours if done by a common grindstone.

#### Chill Mills.

The mint contains two Chill mills. Of these the smaller is used by the deposit melter in grinding iron slags, broken crucibles, etc. The larger, in the sweeps room, is used to grind all the miscellaneous savings containing gold and silver, including furnace clinkers, the worn-out melting pots, and similar matter. The deposit melter's mill is in an alcove of the basement near the center of the main building. The two cast-iron grinding rollers are 18 inches in diameter and 6½ inches face. The pan is also of cast

iron, and is 28½ inches in diameter, with a rim 4 inches high. The rim is 1 inch thick at the bottom and half an inch thick at the top. The die is 1½ inches thick. The pan makes 23 or 24 revolutions per minute, and requires about 3-horse power. The larger mill is of the same pattern. Its rollers are 28 inches in diameter and 12 inches face. The pan is 4 feet 5 inches in diameter, and has a 6-inch rim, which is seven-eighths of an inch thick at the top and 1 inch thick at the bottom. The die is two inches thick. The speed is 20 revolutions per minute, requiring 12-horse power. The ground sweepings are sifted through a No. 60 screen and carefully mixed and sampled. The melter and refiner is credited with the assay value of the savings. The latter average \$200 per ton, and are sold to the Sacramento or Salt Lake smelters.

#### Scales.

Four pairs of Troemner bullion scales are in use—one in the weighing-room, where the crude bullion is received, having a capacity of 6000 ounces; one pair in the cashier's office; one in the melter and refiner's office, and one in the coiner's office—each of which has a capacity of 2000 ounces. Besides the two Oertling assay balances already mentioned there are in the mint 13 small balances, nine in the adjusting-rooms, and one each in the rolling-room, cutting-room; melter and refiner's office, and coiner's office.

#### Elevator.

An elevator runs from the floor of the basement to the second story, and is operated by a worm and screw on a counter-shaft from the line-shaft. The capacity is one ton, the heaviest load being the sulphuric acid tank, which, when full, weighs 1900 pounds.

#### PERSONNEL OF THE CARSON MINT, JUNE 30, 1880.

General department, officers, clerks and assistants.....	32

Melter and refiner's department, officer, clerk and assistants (three refiners included).....	9
Coiner's department, officer, clerk and assistant (nine lady adjusters included).....	20
Total.....	66

#### United States Mint at San Francisco, Cal.

This mint was visited and reported upon in May, 1881. During the fiscal year ending June 30, 1880, nearly corresponding to the census year, it had coined 10,194,950 pieces, of a value of \$36,053,000, running only one shift of eight hours per day. The chief work had been on double-eagles and silver dollars, the value of the former having been \$19,216,000, and of the latter \$7,910,000. The earnings, including seigniorage on standard dollars, were \$1,129,448.74, and the expenses \$502,578.67. The total force employed was 257. The San Francisco mint is of large capacity, and is equipped in the very best manner.

#### Melter and Refiner's Department.

**Refinery.**—The refinery includes the corroding-room, the press-room, the reducing-room, and the laboratory, and forms an L on the second floor. The regular force consists of 13 men, but had been increased to 19 at the time of the examination, owing to the change in process.

**The nitric-acid process.**—At the time of the examination of this mint, the apparatus for the nitric-acid process was being replaced by plant for treatment by the sulphuric acid process. As the former method is being universally supplanted by the better and more economical process of parting by sulphuric acid, a record of the practice at this mint may be of interest.

**Dissolving.**—The bullion was dissolved in white stoneware jars imported from Germany, of which 40 were in stock, 37 having a capacity of 25 gallons and three holding 18 gallons each. The charge of crude granulated metal averaged 100 pounds per jar, and the quantity of acid added averaged 200 pounds, varying, however, with the quality of the bullion. If the bullion contained much coppery base metal, more acid was required. The strength of the acid was 35° Baume. The jars were placed on the floors of wooden inclosures, called corroding-houses, which were filled with boiling water to a depth of 8 inches. Heat was supplied by live steam from the engine boilers through a coil of iron and copper pipes. There were four of these corroding-houses, two having space for 24 dissolving jars each, and two holding 12 jars each. The boiling required on an average six hours, though sometimes it was continued for seven hours. At the end of this period the jars were filled with distilled water and allowed to settle over night. The next morning the liquid was siphoned off, and the jars were removed from the bath and emptied of the gold, which was washed and filtered. The gold was then boiled with sulphuric acid of 62° Baume in iron kettles, washed, pressed in cloth, and dried.

**Precipitating.**—The acid solution of silver and other nitrates were placed in a precipitating tub and the silver thrown down as chloride by the addition of a strong solution of sodium chloride. The precipitating tubs, of which there were two, were of wood, ten feet in diameter and six feet deep, holding about 5000 gallons each, and had wooden false bottoms. They were provided with revolving stirrers, and resembled very closely the agitator of a silver mill. After two hours, the liquid was drawn off through faucets and filtered. The precipitated chloride of silver was washed in hot undistilled water for 18 hours or more until freed from all acid, the hot water removing also the small amount of lead present.

**Reducing.**—The clean chloride was then

placed in vats and reduced by granulated zinc. There were six of these reducing vats, each holding 6000 ounces of chloride. They were rectangular, wooden, and lined with sheet lead. The chloride was first charged into the vats, then the zinc, and water (undistilled) was added. The proportion of zinc to chloride averaged 2435 ounces of the former to 6000 ounces of the latter. The charge was stirred with wooden paddles. About six hours were occupied in reduction, or seven hours including the time required for charging, washing and changing. The zinc salt formed was a waste product, and allowed for in fixing the refining charge. The metallic silver was washed from 2½ to 3 hours with undistilled hot water in wooden filtering vats lined with lead about 3 feet in diameter. Seven of these vats were in use. The clean silver was formed into cakes by hydraulic pressure, and dried. The press was driven by a 10-horse power engine, and exerted a pressure of 40 tons. It had been in use since 1855. Nine of the pressed cakes gave 3600 ounces in bars. The drying furnace had a capacity for 120 silver cakes. The fuel was redwood, and the heat was maintained at a cherry red. The operation of drying could be finished in six hours, but it was the practice to do the drying over night. The subsequent manipulations were the same as now performed. The dried cakes were melted into mint-fine bars and turned into the melter and refiner's office, the customary sampling and assaying being done by assay bars.

**The sulphuric acid process.**—The first kettle charge by this process was made April 19, 1881. The method followed is in general the same as that already detailed in the description of the Carson mint, with, however, the following exceptions: The fire under the parting kettles is started with charcoal and coke and then fed with anthracite. The bullion is charged in the form of granulations, not in shoe-bars. This practice was adopted to avoid dispute with the patentee of a process for parting bars without granulation. The usual charge weighs 4500 ounces, but if the bullion is of good quality the kettle will safely hold 6000 ounces. The proportion of acid used is from three to four pounds per pound of bullion, according to the quality of the latter. If the bullion is very coppery, it requires correspondingly more acid, but in such cases a weaker acid than 62° is used. The first boiling occupies from five to six hours, and the charge is cooled and settled in two hours or is left over night in the kettle, according to the quality of the metal. In discharging the kettles the solution is siphoned off first, the gold being pushed to one side, to allow room for the siphon pipe. This plan has the advantage over that of first ladling out a part of the gold, as it does not subject the operator to the same exposure to the acid fumes. There are four 20-inch furnaces and four cast-iron kettles for reboiling the parted gold. Each kettle is 33 inches in width at the top and 14½ inches deep, and holds 15 gallons. Gold parted by nitric acid requires six or seven hours' reboiling, but that parted by sulphuric acid requires only two hours. The filtering tubs for gold are of wood, each 26 inches in diameter and 23½ inches deep, holding 25 gallons. One small porcelain jar is also used. The straining material is 10-4 unbleached muslin in three qualities. Drilling and blankets are also used. Three and sometimes as many as five charges of acid are generally made; washing is occasionally repeated 10 or 12 times. The sweetened gold is at this mint dried in a furnace, just as is the silver cake before melting. There are two large precipitating vats for the silver-sulphate solution. These have inclined top doors. The proper strength of the solution is reported at 18° Baume. Precipitation is completed in two days of eight hours' heating each. The copper is used in slabs 24 inches long, 10 inches wide, and 1½ inches thick, disposed upon the bottom and upright along the sides of the vats. The charge of copper is 3000 pounds. The precipitated silver is filtered, washed, pressed, and dried as usual. The bluestone formed is crystallized and recrystallized, and is sold in the San Francisco market. The floors of the press-room and the laboratory are covered with sheet-lead, and the other rooms of the refinery are floored with asphalt.

[TO BE CONTINUED.]

**CONVERTING OLD SHIPS INTO COAL BARGES.** The Boston Tow-Boat Company have recently been buying up old ships and converting them into coal barges. After these ships have their spars taken out they have their cabins turned into carrying capacity, and all the houses are built above the decks, thus enabling them to carry from 2000 to 3000 tons of coal each—more than three times as much as the ordinary coasting schooner can carry. The barges are towed to and from Philadelphia by tugboats owned in Boston by the owners of the barges. This undertaking has proved a success and is greatly interfering with the coasting schooners, for the barges are able to carry the coal at much lower rates.

**EMIGRATION TO CANADA.**—Notwithstanding the effort to boom Canada through her recently completed continental railroad, statistics show that emigration thither is falling off. The railway is probably less seductive than had been hoped.

**THE Big Bottom Mill Company** has commenced work on a private railroad from Guerneville to its mill. The road will be about three miles in length.

#### Zinc Works in Colorado.

The following letter from R. O. Old, which appears in the *Georgetown Courier*, shows that steps are being taken to erect zinc works in Colorado:

GEORGETOWN, COLO., Nov. 8, 1886.

**Prof. E. E. Burlingame, Denver, Colo.**—MY DEAR SIR: Your favor of the 4th inst. to hand. I am glad to know the Chamber of Commerce, of Denver, is moving in the matter of securing the erection of zinc works in that city, and hope no effort or influence will be wanting that, at this time, would be likely to result in their firm establishment, not only for the benefit of Denver, but for the sake of the advantage they would be in creating a market for a hitherto large non-valuable product of our mines.

You desire me to answer certain interrogatories. This I will do to the extent I am able. 1st. As to locality of mines capable of producing large amounts of zinc ore (assaying high in zinc), their nearness to railroad, and distance from Denver.

**Answer.**—If all the zinc ores (blende and calamine) of our mines (I mean of our county of Clear creek) were utilized, that go over the dumps (all the dumps, for instance, of my Mendota mine and Victoria tunnel), or are left unbroken (though exposed) in the same, because of its non-value for lack of a market, I believe the output of 100 tons per day might for a certainty be depended upon. I could supply myself readily 10 or 12 tons per day even now, and, with the inducement of a market, 20 tons.

As you are aware, there are but few of our mines in Clear creek that are not conveniently near to the numerous depots of the Colorado Central branch of the U. P. R. R. With regard to myself (as with some other mine-owners and companies) the U. P. Co. have given me a "siding," that I have built a trestle out to, over which I tram from my V. T., and dump direct into the cars of the same.

Our distances by railway from Denver vary for our different districts from 35 to 60 miles, and the freight (which is much too high) from \$3 to \$5 per ton. It should not be but from \$2 to \$4.

2d. Probable cost of mining per ton.

**Answer.**—The extra expenditure of time necessary to prepare our zinc ores for market, they being already mined, or are ready to be mined (where exposed in our workings) would vary from \$3 to \$6 per ton.

3d. Percentage of metallic zinc.

**Answer.**—The per cent of metal in our zinc ores would vary (where mined and dressed for market) from 40 to about 65 per cent. In many of our ordinary "dry ores," as sold for their silver (and sometimes both for silver and gold), the per cent of zinc will run from 2 or 3 to 43 per cent; and in our ordinary galena ores, as sold, the amount of metallic zinc will vary from almost nothing to sometimes 30 per cent. All jig screenings of zinc in the concentrating mills of our county are thrown away, that perhaps might be thought would assay 30 to 50 per cent of metal.

4th. Value per ton of our zinc ores in gold and silver.

**Answer.**—All of our ores, whatever their per cent of metallic zinc, assay silver, and sometimes gold, but not so frequently the latter as the former. I am referring only to our Clear Creek county ores. In fact ours is an argentiferous zinc ore, whether blende or calamine, and runs from a few ounces to hundreds of ounces of silver per ton. But the ores thrown over the dumps (for instance over all of my dumps) carry from 8 to 20 ounces silver per ton, averaging, perhaps, 15 or 16 ounces.

5th. The percentage of iron, lead and copper carried in our zinc ores.

**Answer.**—In what would become an ordinary zinc ore, if dressed for market, there would sometimes be carried a little lead—2 to 10 per cent, with no appreciable amount of copper (again I would say I am only speaking of the ores of our county), while of iron—sulphide of iron—there would often be a considerable amount, say sometimes, in poorer zinc ores, as high as 25 to 35 per cent.

**THE PATAGONIA GOLD FIELDS.**—Messrs. Frank Jordan and S. W. Bell are in receipt of a letter from E. L. Baker, U. S. Consul at Buenos Ayres, giving information about the recently discovered gold fields of Lower Patagonia. Very little had been accomplished at the new diggings for the reason that the Government placed a military guard over the coveted land and had driven out all who were working. Subsequently, however, several thousand claims were disposed of to about 200 different persons, but it is said that two parties, Messrs. Nield & Co. and Lezama & Co., own the best ground. As to the value of the gold fields, there was a diversity of opinion, some claiming that the reports were greatly exaggerated, and that persons who go there will be disappointed. The diggings are located at the extreme southeastern point of Patagonia, the new boundary line between the Argentine Republic and Chili running through them. The locality is inaccessible, the best route being by Liverpool and Pacific steamer to Sandy Point, thence by trail 150 miles to Cape Virgenes. Mr. Baker says: "I would not advise any one to go there yet. Indeed, if it proves that there is gold at Cape Virgenes it must be washings from the Andes mountains, and that still farther inward it must be discovered in larger quantities." Parties are prospecting the gulches nearer to the mountains.—*Ex.*

#### Passing Events.

The mining share market, which has been advancing steadily, "broke" on Thursday, and a number of failures of brokers resulted. Those who bought shares on a margin suffered, and many lost their whole investment. At the close of the week the whole market is in a state of panic, prices having dropped materially in one day.

The partial settlement of the Anaconda dispute in Montana has resulted in the starting up of the smelting works again. Some of the men, however, still refuse to accept the reduced wages offered.

The activity in quartz mining in California continues, and many new mines are being opened. It is noted elsewhere that at the old Benton, Mono county, mines steps are being taken for some important work. The advantages of the comparative mildness of our winter months in this State enables men to work to greater advantage outdoors than in most mining regions.

It is stated that the principal hydraulic miners in Nevada county are gradually getting rid of the quicksilver heretofore held in stock for gold-saving purposes. The price is higher than when it was purchased some time since. The stoppage of this class of mining has stopped the annual production of many millions of gold, and it is to be hoped that some plan will be devised before long by which they can carry on operations once more.

#### Suggestions for the Use of the Prospector and Miner.

Having in a recent number of the PRESS assumed to advise that more of our young men betake themselves to mining as a pursuit in life, we now give some general information, accompanying the same with a few rules that may be found useful to those engaged in searching after, examining and working deposits of the precious metals, a class made up mainly of the prospector, the miner, the expert, the capitalist, the metallurgist, the machinist, the millwright, and such others as may be engaged in beneficiating the ores or otherwise providing means and appliances to that end.

The prospector is he who goes out to search after mineral deposits, of whatever kind, plying his vocation usually in new or little explored regions. He is the path-finder and *avant courier* of the business. The term is a new one, which came into use with the discovery of gold in California, having been coined for the occasion. Following, and sometimes accompanying the prospector, is the working miner, a man of less sanguine and hopeful temperament, but of more patient and stable habits. Locating claims as does also the prospector, the practical miner stays by and develops them, sometimes putting up plant and bringing them to a state of active and profitable production. The difference between these two classes of operators is not always marked by broad lines of distinction, the miner sometimes going out to hunt for new lodes or diggings and the prospector just as often remaining by and going to work on what he has found. In a large sense, the miner is supposed to know something about the geology of the country, the character and value of ores, as well as how to open up and prove a mine.

The business of the expert is to examine and determine as far as may be all the features and conditions of an ore deposit that tend to illustrate its economic value, including accessibility, facilities for working, etc. He should, therefore, be conversant with geology, mineralogy, mechanics, and in short, with everything pertaining to mining as a practical business. The duties of the several other agents and helpers mentioned being sufficiently indicated by their respective names, need not here be enlarged upon, the capitalist being he who furnishes the means for accomplishing all, save only perhaps the comparatively small expenditures made by the prospector and the miner.

Although California, which offers at present the best field for mining extant, has been pretty thoroughly explored, some portions of it still invite the labors of the professional prospector and the miner desirous of finding claims for himself, there remaining in the southern and southeastern sections of the State much nearly virgin territory.

As a general thing, neither of these parties will find it expedient to take with them more in the shape of testing apparatus than a magnifying glass, magnet, pocket-compass and batea or horn spoon. As regards the precious metals, they may be said to occur in almost every geological formation, free gold being found in the alluvions and the auriferous ores, oftenest in the slates and igneous rocks, but not generally in the limestones or the bituminous shales—never in close proximity to coal. This metal has, however, a wide distribution and may be looked for almost anywhere. As the Biblical writer remarks, "Gold is where you find it." Silver, on the other hand, is more universal in its habitat, being found often in formations where gold is rarely or never met with. But then silver does not, like gold, occur in the drift or other surface deposits. With the exception of the *plancha plateas* of Southern Arizona and Northern Mexico, no silver placers have ever been found.

Metalliferous veins and ore deposits occur sometimes wholly in a single geological formation, as in porphyry, slate or granite, and sometimes between two different formations, constituting what are denominated contact veins, a style of deposit that is apt to prove powerful, fruitful and permanent. Most of the masterly veins of the world are of this character. The Comstock, the mother lode of California, and the *Veta Madre* of Mexico, belong to the contact school of veins.

In exploring for, locating and opening up gold and silver bearing lodes, the following general rules may be found useful to the prospector and

miner, more especially if new to the business. Bearing in mind what has already been said, the site of mineral veins where their presence is not made manifest by their outcrop, may often be fixed by observing the drift or float rock found below them, and tracing the same up to a point where such float ceases and at which the vein, by digging, will generally be found not far below the surface. The work of prospecting for blind ledge is best done by running slight trenches or plowing furrows at right angles with their supposed strike, this work being performed by means of water where there are facilities for so doing it.

The vein having been found and traced, its course or strike, being the direction in which it runs, is determined by compass, being established in accordance with the magnetic variation. By the clinometer its dip is next measured, that is, its declination from the horizontal. If a north and south vein dip to the east, then its inclination would be toward the west. As mineral veins are apt to widen out in some places and contract in others, cross measurements must be made at different points with a view to ascertaining their average thickness. As soon as practicable the quantity and quality of the ore must be determined; the character of the country rock must be noted; also whether or not there exists a clay lining between the vein matter and the walls of the vein. Examine the walls to see whether or not they are striated or scratched. Facilities for exploiting the mine by tunneling, timber and water supply, climate, proximity to farming and grazing lands, cost of labor and transportation, are all to be carefully considered, since unfavorable conditions in any of these particulars might greatly hinder and even defeat a mining enterprise that might otherwise have resulted in success.

Everything considered, there is hardly a doubt but the mineral regions of California offer better inducements to all who may contemplate engaging in the business of mining for the precious metals, prospectors included, than any other country in the world. The climate here is unrivaled, both as regards equability, comfort and health. Most of the districts are well timbered and watered, besides containing a considerable proportion of good grazing and farming land. Fruits of the finest quality can be grown everywhere. Excellent wagon-roads traverse all the districts, into many of which railroads have already been extended. Transportation is therefore cheap, rendering the cost of living, as well as the supplying of the mines with plant, very moderate. We strongly advise all who think of turning their attention to mining, that they visit and carefully canvass the advantages of our California gold fields before going elsewhere in search of a theater of labor.

#### Foundry Notes.

At the Pacific Rolling Mills they are building an extension to the steel works, 40x50, where it is stated that a new furnace will be put up.

The Union Iron Works have put up a large building in the shipyard for their wood-working machinery, this being a more convenient place than where it was before.

The Dow Pump Works are building a number of pumps of various patterns, all of the Dow patent.

The bar-iron mill is now the busiest portion of the Pacific rolling mill plant.

The Union Iron Works Company has been awarded the contract for building another deck on the steamship *San Pablo*, of the Occidental and Oriental line. The accommodations for passengers on this steamer are very limited, but the intention of the company is to make her fully the equal of the other steamers on this line. The improvements will be made on her return from Hongkong, and it is thought she will be laid up for about three months.

Fresno is anxious for some one to come to that town and start a foundry.

George G. Allan, of the Nevada foundry (Nevada Co.), has just delivered seven Pelton water wheels for the new North Star quartz mill. The wheels are of different sizes, according to the different uses that will be required by the mill. Mr. Allan has the exclusive right for the manufacture of the Pelton wheel. About 100 of these wheels have been built by this foundry during the year.

#### Mining, Metallurgy and Geology at the University.

The President of the University of California, E. S. Holden, in his report just issued, states that in order to equip the mining laboratory a legislative appropriation of \$5000 for the next two years will be needed. This, with what has been expended before, will supply the necessary machines, apparatus, etc., for these two important departments, which, by the way, now return \$250 a year to the University on account of fees paid by students. It is recommended that the salary of Professor Christy be raised from \$200 to \$250 per month.

In the department of mineralogy, petrography and economic geology, under charge of A. W. Jackson, the president recommends an assistant to prepare rock sections for study and to assist in the care of the collection, as well as for beginning the much-needed mineralogical survey of the State. He also recommends that Mr. Jackson's salary be raised from \$2400 to \$3000 per annum.

The museum of the department of mineralogy does not grow because there is no fund available for making exchanges of specimens with other colleges. The president states that a museum of technical geology to illustrate the building stones, the artificial stones, clays, brick, limes, mortars, cements, mineral paints, etc., should be formed for the use of this department jointly with that of civil engineering. A sum of \$200 a year is required in order to transport such specimens as will be presented from the place of their origin to the University. Beside these annual expenses, a sum of \$1000 should be set apart for the commencement of the museum of technical geology by the purchase of the more important and expensive specimens, and a sum of \$1000 should be appropriated for a collection of crystal models and for miscellaneous physical and chemical apparatus required in the work of the department.

The museum of petrography has been increased by the purchase of a small collection of American rocks, and a portion of a collection of European rocks, from the last legislative appropriation for the department of geology. The rest of the European collection could not be obtained for lack of time before the end of the fiscal year in 1887. An appropriation of \$850 is needed to complete the collection of European type-rocks.

The museum of economic geology, which should contain a suite of specimens illustrating the mineralogical composition, wall-rocks, and geological peculiarities of every important mine in the United States, and of the leading mines of Europe, has been hardly more than projected. It contains collections from a few California mines, obtained personally by the professor in charge, and from a few other mines, donated by friends of the institution. The collection is one of the most important, both from educational and scientific points of view, that the University should make, and at least \$5000 should be appropriated for obtaining by purchase the material that cannot be personally collected by the professor. Such a collection would find its most important use in immediate connection with the instruction of the mining students in the special branch of mining geology.

It is evident that Prof. Holden recognizes the importance of these departments, and it is to be hoped that the Legislature will grant the requests made, and put them on a better basis than they now stand. California holds first rank as a gold producer in the Union, and second rank in total product of precious metals. She has also within her borders many mineral and metallic substances but partly developed into paying industries, but which should be fostered. The University can do a great deal toward our mineral development, and it should, as well as the State Mining Bureau, receive full encouragement from the people of the State.

THE total coinage for November at the San Francisco Mint was as follows: Half-eagles, \$880,000; eagles, \$300,000; dollars, \$300,000; dimes, \$16,652.40; total, \$1,496,652.40.

At Mountain House, Douglas county, Nevada, a two-stamp mill, operated by horsepower, produced gold bullion, valued at \$2000, during the month of October.

LEADVILLE has yielded over \$100,000,000 since the carbonate discoveries in 1876.

## The New Cruisers.

One of Them to be Built in San Francisco.

It is a cause of rejoicing to San Francisco and to the whole State that one of the new cruisers will be built in this city by the Union Iron Works. This means the beginning of an era of ship-building on this coast. From the fact that we have built no large iron steamers here, few suppose that we had the facilities for constructing a modern war-ship. The Union Iron Works, however, have a complete plant for ship-building purposes, and as good vessels can be built here as anywhere in the United States. The bids on the cruisers, opened in Washington a few days ago, were as follows:

Cruiser No. 1—4000 tons, complete. The Harlan & Hollingsworth Company, Wilmington, Del., \$1,224,900; Union Iron Works, San Francisco, \$1,132,000; Cramp & Sons, of Philadelphia, under a special bid providing for the use of engines of their own design, \$1,198,000.

Cruiser No. 2—Complete, according to the Department's designs. Cramp & Sons, \$1,065,000; Union Iron Works, \$1,017,500. Special bids providing for the construction of engines according to their own designs were put in by the Harlan & Hollingsworth Company at \$1,100,040, and by Cramp & Sons at \$1,510,000.

Cruiser No. 3—Complete according to the Department's specifications. Cramp & Sons, \$1,325,000; Union Iron Works, \$1,348,000; the Harlan & Hollingsworth Company, under special bid, using their own engine designs, \$1,452,000.

It will be seen that the bid of the Union Iron Works on Cruiser No. 2 was \$47,500 less than that of Cramp & Sons, the latter firm putting in a bid of \$1,065,000; the Union Iron Works, \$1,017,500.

The Union Iron Works also bid lowest on Cruiser No. 1, but the Secretary of the Navy refused to accept the bid because it was higher than the maximum amount fixed in the appropriation. He will doubtless bring this to the attention of Congress, and perhaps we will get two cruisers to build on this coast instead of one. How the Charleston and Newark will compare with each other may best be seen from the following comparison:

	Newark.	Charleston.
Length on load line.....	310	320
Extreme beam.....	49:1½	46
Mean draught.....	18:9	18:6
Load displacement—tons.....	4000	3750
Natural draught, horse-power.....	6000	.....
Forced draught, horse-power.....	8500	7650
Screws.....	twin	twin
Speed—estimated, knots.....	18	18:3
Coal capacity—tons.....	850	800
Number of men, including officers.....	300	325
Main battery—breech-loaders.....	12 6-in. (210-in.)	6 6-in.
Secondary battery—Newark, 11 small guns; Charleston, 14 small guns.		

Messrs. Irving M. Scott and Geo. W. Dickie, representatives of the Union Works, are now in Washington, and the latter telegraphs that the contract for Cruiser No. 2 will be awarded to them. Mr. Geo. W. Prescott, the president of the company, says: "The competition for these contracts was very keen. The Eastern firms were determined not to allow the contracts to come to this coast if they could possibly help. We would have taken one of them at the actual cost price of the work, for the vessel would have proved the best advertisement we could have made. Our equipment is as complete as any in the country, and better than Cramp's. Work will commence on the cruiser the moment the contract is signed, and will, roughly speaking, employ at least 1000 men for 18 months. The bids are all really less than the work is worth. The bids on the 4000-ton cruiser all exceed the limits of the appropriation, and Congress will in all probability either increase the appropriation or authorize the secretary to advertise again for bids. I think the Government fully recognizes the necessity of having on this coast some establishment where work of this character can be rapidly and efficiently executed.

"As to making heavy guns, there is no foundry in the country which can do such work as is done abroad. For instance, the plant necessary

for turning out a 100-ton steel ingot would cost \$1,000,000, and as private individuals have no use for such weapons, the only customer is, of course, the Government. In France and England the Government subsidizes certain establishments, and in that way enables them to erect the expensive plant necessary for making guns of huge caliber, and the Government also guarantees a certain amount of work. Congress has a Gun Foundry Committee, which has investigated this subject, and will in all probability recommend that three or four establishments be subsidized for the purpose of maintaining a gun-making plant. If such action is taken, this coast will, of course, receive recognition."

## The Late J. S. Phillips.

The many friends and acquaintances of J. S. Phillips, formerly of this city, will regret to learn of his death, at Sydney, Australia, from apoplexy. Mr. Phillips was the author of "The Explorers, Miners and Metallurgists' Companion," a work published while he was a resident of this State. He was also inventor of the "Wee Pet" assaying apparatus, a portable appliance for carrying on prospecting trips, but adapted also for office use, with tools for all kinds of discrimination and apparatus. Two editions of the Explorers' Companion were published, and were well received by the press.

Mr. Phillips especially prided himself on his practical knowledge, and the practical charac-

and many of them own from two to three houses and all are well satisfied with their lot. The rules of the Bricklayers' Union permit of the employment of only two apprentices at a time upon any building, and only that number is allowed with a gang. No boy over 17 is allowed to become an apprentice.

## Retorting Gold Amalgam.

In treating amalgam obtained in the process of gravel mining, the quicksilver and amalgam are well stirred in buckets, and the coarse sand, nails and other foreign substances which float on the surface are skimmed off. This residue (which holds considerable amalgam) is concentrated by washing in pans or rockers, and the concentration ground in iron mortars, and treated with more quicksilver. Any base material which floats on the surface of the bath is melted by itself to a base bullion. The remainder is added to the fine amalgam. The amalgam is strained from the quicksilver through drilling, and the dry amalgam is re-retorted in iron retorts.

Where the amount of amalgam obtained is small, the hand retort is used; but at large gravel mines the cast-iron retorts are made stationary, similar to those used at gold and silver quartz mills, only that they are smaller. Where large quantities of amalgam are retorted, and the furnaces when fired are left unattended, as is frequently the case, the retort, which is set immediately above the fire, becomes over-

METHOD OF SETTING RETORTS FOR GOLD AMALGAM.

ter of his work. He was very much opposed to all "jobbing" in mining and kept for himself a clear record in this respect as a mining engineer. He clung somewhat tenaciously to those things he learned early in life in Cornwall, a circumstance that tended to retard his advancement in his profession on this coast. In his book, however, are many truths specially applicable to the new regions on this side of the continent.

Mr. Phillips always impressed all who came in contact with him with his earnestness of purpose and his integrity. He could have made more money had he been less conservative; but he could seldom see mining properties that came up to his ideal, so that his reports were most frequently opposed to the interests of sellers.

For many years Mr. Phillips kept an assay office in San Francisco, where he also taught assaying. Some years since he went to New York to practice his profession, and about a year ago left for Australia, where he died. In many respects he was a peculiar man, and some of his geological theories, advanced in his book, were entirely opposed to those commonly accepted. Although he had abundant confidence in himself, he was of a retiring disposition and mingled but slightly with others, preferring to work at his office and desk by himself. His writing was carefully done, most of his work being rewritten several times before it satisfied him.

THE condition of the bricklayers' laborers or hodmen, in San Francisco, is far above that of their fellow-laborers in the East. In no other city in the Union can it be said that so many hodcarriers own the houses in which they live. One hodcarrier in this city owns several buildings, which he erected out of his savings,

heated. The weight of the metal which it contains then causes the retort to "belly," which ruins it. To overcome this difficulty, the retort should be set with supports and arranged with the fire to one side that the heat may be evenly distributed over it. Retorts thus set work well in practice. The figures on this page, from Bowie on Hydraulic Mining in California, from which book we take these facts, show the method of setting retorts.

The amalgam should be carefully introduced and evenly spread. The iron pipe which connects the back end of the retort with the condenser must be clear of all obstructions, and under no circumstances should the amalgam be spread so that the pipe can possibly become choked, as in that case an explosion would probably ensue.

To avoid any danger arising from this source, after the cover has been put on, luted with either clay or a mixture of clay and wood-ashes and securely clamped, the fire is lighted and the heat gradually raised, a dark-red heat being all that is necessary to thoroughly volatilize the quicksilver. Toward the end of the operation the heat is raised to a cherry-red color, at which it is kept until distillation ceases. The retort is allowed to gradually cool, and when cool is opened.

During the operation the condensing coil at the back of the retort should be kept cool by a continuous supply of fresh water entering from the lower end of the box which contains it, while the discharge of warm water is effected above. The retorted bullion is cut or broken in pieces and melted in a well-annealed black-lead crucible and the gold cast into bars.

ARRANGEMENTS are being made for the resumption of work in idle mines on the Comstock.

## Literary Work of University Professors.

In the biennial report of the President of the University of California, on behalf of the Board of Regents, to the Governor of the State, is given the academic history of each member of the teaching force of the University. It is the intention to compile a complete bibliography of all the published writings of professors and instructors. A compartment of the library has been set apart for the accommodation of all writings of members of the Academic Senate. In the list is given the name, birth-place, name of college where the individual graduated, degree taken, names of learned societies of which they are members, etc.

In looking over this list we are pleased to notice how many of the faculty have contributed more or less to the columns of the MINING AND SCIENTIFIC PRESS from time to time. Among these contributions have been the following: H. H. Behr, professor of botany in College of Pharmacy, paper On Insecticides, and other contributions of a scientific nature. S. B. Christy, professor of mining and metallurgy—"Ocean Placers of San Francisco," "The Mines and Works of Almaden, Spain," "Lowe Water Gas," "Quicksilver Reduction at Almaden," and numerous shorter articles. Frederic G. Hesse, professor of mechanical engineering—"On the Instantaneous Reduction of Ores to Powder by Concussion, and On a System of Automatic Sizing," "On a Continuous Ore Amalgamation," "On a New Fluid Pressure Gauge for Laboratory Use," etc.

Prof. E. W. Hilgard enumerates so many standard writings that he does not mention minor articles or transient publications, but he is a constant contributor to the press, setting an example that other professors might follow, on popularizing the work of the university. A. W. Jackson, instructor in mineralogy, has contributed to the Press, "The Study of Rock Genesis," "Occurrence of Silver in Sedimentary Rocks," "Lecture on Minerals," "On Rocks," "On the Structure and Genesis of the Bassick Ore Deposit." Prof. John Le Conte has contributed, "Igneous Meteors," "Origin and Distribution of Lakes," "Meteorology of the Pacific Coast," and other articles. Albin Putzker, "The Scientific Study of Languages." Wm. B. Rising, professor of chemistry, "Occurrence of Quicksilver at Sulphur Bank."

It seems apparent that President Holden, both by precept and example, is encouraging the other members of the faculty to give the benefit of their knowledge and research to the public. Some of them have done a great deal of the "outside work" and others very little. It is to be hoped that all of them will in the future be more frequent contributors to the public press and the local learned societies. By so doing the various departments of the university will be brought into more prominent notice, and the public better appreciate the work that is being done.

GEN. J. R. BAYLER has brought into Galveston some fine specimens of gold-bearing quartz from the Nueces canyon, Uvalde county, Texas. He claims that prospectors have discovered valuable deposits of quartz in that locality.

THE attempt to bring out Hungarian miners to work the mines on the Northwest Territories has failed. A number employed on the Saskatchewan mines proved worthless, and Scotch and English miners had to be sent for.

THE Santa Cruz Sentinel says: At the asphaltum beds, near this city, an average of 25 tons per day have been mined and shipped during the past summer. At present about 30 tons a day will be mined and shipped.

IT is stated that gold deposits have been found in Indian Territory.

A MOVEMENT is on foot to establish sampling works at Boise, Idaho.

## MECHANICAL PROGRESS.

## The Compound Steam Engine.

Mr. J. Richardson, in his paper on "The Compound Steam Engine," read at the recent meeting of the British Association, stated that, though there is no theoretical limit to the economy to be obtained by extremely high degrees of expansion, yet there are practical limits which are soon reached for non-condensing engines. In these the steam must not be expanded below the atmospheric pressure, or back pressure and waste of power are the result. To prevent this, a very high initial pressure must be used, and, as with 140-pound boiler pressure or 155-pound absolute, steam expanded ten times leaves only one-half pound pressure in the exhaust, this is fixed upon as practically the most useful degree in non-condensing engines. Reference was made to the use of steam at much higher pressures—500 pounds and upward—and used in three or more cylinders, yet the difficulties attending the production of steam at these high pressures and temperatures, and the maintenance of the working parts of the steam cylinders, were stated to be such as more than counterbalance the advantages to be obtained from their use. While it could be shown that expansion could be carried to such an extent that while the efficiency of the steam, considered merely as steam, would continue to be increased, yet a point would be reached when it would be barely able to move the piston it was intended to propel, and when, therefore, the engine in which it worked would be practically useless. A comparison was instituted between the single-cylinder expansive engine and the various classes of compound, namely, those which have the low-pressure cylinder parallel with the high, as in the Woolf engine, on the same center line, as in the tandem, and those with cranks at right angles, the advantages and disadvantages of each type being pointed out. The proportions to be maintained between the cylinders were next considered, and the advantage of the intermediate receiver and heater were referred to; the advantage of expansion gear to the low-pressure cylinder, not merely for the purpose of securing greater economy, but also for the sake of securing uniform distribution of the load between the two cylinders, was pointed out.

Illustrations and diagrams of the earlier types of engines were given, and indicator diagrams showing different methods of distributing steam, together with large diagrams showing modern tandem compound horizontal engine, coupled compound with locomotive boiler combined, as well as details of the valve gear of each, and the method of automatically regulating the supply of steam. The compound engine as now constructed was claimed to be the most perfect form of steam motor, comparatively small engines under 100-horse power and without condensation giving a horse-power for somewhat under 20 pounds of steam per hour, while large engines when fitted with condensers have been shown to use no more than 12 pounds of steam per horse-power per hour. At the same time the construction of compound engines has been so simplified that they have no more parts, and are no more difficult to manage than ordinary double-cylinder high-pressure engines.

## Hardening Steel.

We have given several paragraphs in these columns, of late, in regard to various methods employed by different mechanics in hardening steel. A writer in the *Boston Journal of Commerce* furnishes that paper with some criticisms on these methods which possess considerable interest, especially as the writer is evidently a thoroughly practical mechanic. We copy as follows: "To temper steel very hard," and in "Mercury for hardening steel," there is food for reflection on the part of those who, like the writer, have been wrestling with the apparently inanimate cussedness of steel for many years. So we have finally found out why we have had so much trouble in hardening steel, have we? "Water gives an unequal temper, and only for the circulation produced by bubbling and heat it would be unfit for hardening in." Yes. But who of us that use water depend upon such circulation? Don't we have all sorts of rigs for forcing a strong current of water against the heated piece we wish to cool? From above or below, or both, from one side or another, or all sides, we set the cold water in motion with a force which precludes any possibility of steam bubbles enveloping the heated steel, thereby preventing the heat from escaping. Not always? No. But if we don't, we souse the piece that we wish to cool up and down and sidewise. We even take a long stick and stir the water up in the bosh, turning it into a miniature whirlpool, before we dip the hot steel into it.

"Sealing wax for jewelers!" and "cold air for Damascus blades!" looks well in print, but we practical fellows want means to temper—that is not the word—harden, all sorts of pieces from those as small as the tools of jewelers up to hundreds of pounds in weight, needing to be handled with a crane, and we do it in water. Mercury to harden a graver, hand-tool, chisel, screw-driver, or small tool in is all right, perhaps; but if we had a cast-steel roll or a big die of 500 pounds to harden, perhaps the mercury man will tell us how much mercury would be wanted, in what kind of receptacle, and how

the circulation, just as necessary as in water, would be kept up. "Mercury-hardened steel will cut almost anything," will it? So will cold-water hardened steel, and "steel hardened and tempered to a straw color" is being turned daily with tools hardened in clear cold water. "Oil is used." Why? Because at the same heat it does not make steel brittle. Because for uses requiring great toughness and not an extreme degree of hardness, notably for springs, oil is believed to give better results. Heated steel cools in oil more slowly than in water. Steel is usually heated for hardening hotter than is necessary or good for it. Cooling in oil being less sudden lets the steel assume more nearly its normal condition than if cooled in water at such high heat, but with the heat lower in proportion to the more sudden cooling by dipping in water even better results can be had from water hardening than from hardening in oil.

From the time when as a little boy, nearly 50 years ago, I heated bits of steel and made a "siss" by plunging in water, and then brightened them by rubbing in the scales on the old smithy floor, or on a brick in the forge chimney, and heated them up to watch the beautiful colors as I had seen father do, I have been hearing of some special methods for hardening, and still in all my practice, and so far as my observation extends, water stands at the head as a bath in which to quench heated steel for hardening. Yes, that's right. "Quick cooling" does the business, and water judiciously used cools quickly.

## Improvements in Glass Manufacture.

Thirty-five years ago a man named William Clarke went to Pittsburgh and attempted to make window glass by rolling it in reversible rolls, such as were used to roll iron and steel. The attempt was a dismal failure, the glass cooling so fast as it passed through the rolls that it became too brittle for use. Now natural gas comes to the rescue and makes the scheme practical. A well-known Pittsburgh inventor has filed an affidavit of priority to an invention which promises to go a long way toward revolutionizing the window-glass business, it is claimed. He proposes to make sheets or plates of glass in reversible rolls ten times as rapidly as they can be made by the present method of rolling plate glass. The rolls will be set stationary and will be hollow. A natural-gas pipe, with jets on all sides, will run through the center of each roll and keep it constantly heated. The glass will be caught as it comes through the rolls on an iron plate, also constantly heated by gas. It will be run along this plate straight to the annealing oven, so that at no time during the process will it have a chance to cool. The invention will dispense with blowing in making window glass.

## A Siemens Glass-melting Furnace.

Glass manufacturers are interested in some experiments conducted by the Chicago Glass Manufacturing Company in the use of a Siemens glass-melting furnace, with open pots, for flint glass. This is the first attempt to melt flint glass in open pots for the Siemens furnace, and only the second to use open pots for this kind of glass. The first attempt was made by Berger Brothers, of Philadelphia, but they ultimately returned to closed pots. It is claimed that the new process will melt glass in 7 hours and 45 minutes, while the old-fashioned furnaces take from 15 to 24 hours. Thus a great saving of fuel is effected.

## Compressed Air for Glass Blowing.

Another scheme has come to the surface, says a Pittsburgh paper, accompanied by the moss-covered chestnut that "it will revolutionize the glass industry." The scheme referred to has been thoroughly tested by E. C. Long, of Pittsburgh. When asked the nature of it he said: "It is a combination to blow window glass by compressed air, invented by Dr. Willmet G. Bailey, of Burgettstown. We are now making some machines. A patent has been applied for, and some of the machines may be introduced next fall. The air is stored anywhere convenient, and is conducted by a hose to the machine. The glass is prepared the same as in the old way. Then the pipe is inserted in the machine and the air is let on by touching an electric button. We claim that five times as much glass can be made by the use of these machines as the old way. It will dispense with the services of a number of blowers, but more gatherers will be needed."

MIRRORS OF AMERICAN MANUFACTURE RIVAL IMPORTED ONES.—Up to the present all mirrors manufactured in the United States have been from imported glass. The quality of the glass to retain the silvering and give a perfect production of the object must be of the best. This quality Pittsburgh had never been able to produce until natural gas came into use. Now, by its aid, the fineness of the glass produced rivals that of the imported article. The entire absence of impurity, the perfect fusing of the ingredients, the rapidity of the melting and the pure, intense flame for reheating or working, are the principal advantages.

THE LIGHT FROM COAL.—One pound of coal, according to recent Franklin Institute tests, will yield an amount of light averaging 150 candles with the electric arc light (about 60 per cent of this if glass shades are used), 20 candles with incandescent lamps, and 14 to 17 candles with gas. In this estimate it is assumed that steam coal is burned under a good boiler for the electric lights, and that the gas is obtained from a bituminous coal.

## SCIENTIFIC PROGRESS.

## A Practical Use for Leidenfrost's Drops.

Water placed upon a red-hot metallic plate springs into the form of a drop, and evaporates without coming in contact with the plate, as is known to all. It is equally well known that by using a concave vessel, the drop continually rotates. To Bolig belongs the credit of suggesting the practical use of the Leidenfrost experiment, more especially in water analysis for determining the solid residue of natural water. Where hitherto this determination has been effected by evaporating the water to dryness without boiling in a platinum dish on a sand or water bath, and afterward weighing the already tared dish, Bolig, according to the *Rundschau für Pharmacie*, proceeds as follows: He brings a shallow platinum dish to a bright red heat over a gas lamp, measures out 50 c. cm. of the water to be analyzed, and by means of a pipette lets single drops of it fall into the capsule, where they gather into a fluid globule or spheroid, which begins to rotate. The evaporation proceeds quietly, without any spurring, and new quantities of water are added, drop by drop, so that the spheroid always preserves a suitable and comparatively unvarying size. The operation can be carried out successfully with little practice, and is extremely elegant and precise. It is only necessary to be sure that the vessel is kept at a red heat, and that too many drops are not added nor in too rapid succession, as otherwise the sudden cooling would cause a spurring of the fluid. Too rapid a rotation of the globule is prevented by letting the next drops, when it is time to add them, fall in a direction opposite to that of its rotation, so as to keep its movement in check.

When the 50 c. cm. of water are in the capsule, the operation is soon ended, the globule rapidly grows smaller, darker in color, until it resembles a pea, the rotation slackens, and eventually ceases. The flame is then removed. The globule of residue lies perfectly loose on the capsule without showing any adhesion. Thus there is obtained the solid residue of 50 c. cm. of water which has been evaporated without contact with the sides of a vessel without loss and without contaminating mixture, in the shape of a little globule which is exposed for a good while to a temperature of 180° C. until dry, and then is rolled directly upon the scale pan of a chemical balance and weighed within  $\frac{1}{4}$  mg.

The advantages of Bolig's method may be thus summarized: The residue is in the shape of a little bead with so small a superficies that, even if it contains chloride of calcium or chloride of magnesium, the absorption of water from the air is almost nothing, especially as the time of exposure is soon over, on account of the small weight to be weighed. Moreover, there is nothing to prevent the weighing of the globule in an air-tight, closed tube, well dried beforehand. It is unquestionable that this new method can be adopted for the evaporation of all sorts of fluid to dryness without loss and for a large class of cases, if one includes different modifications of the method. For example, the platinum may be replaced with equal or greater advantage by silver, copper, or even pure nickel, and the method is not limited merely to solutions in water. There is no true contact of the fluid to be evaporated with the sides of the vessel, so that no chemical action can affect them. Hence *aqua regia*, sulphur compounds, etc., can be treated in red-hot silver vessels without the latter being at all attacked.

## The New System of Conducting Electricity.

In our last issue we made a brief allusion to the recent invention of Mr. Westinghouse, of a new system for the transmission of electricity by which the cost of the same was greatly reduced. A late number of the *Providence Journal* gives some particulars in regard to the matter of this invention which will possess much interest to all in any way interested in the economic application of this comparatively new source of power. We collate as follows: There is no especial reason to deny that the principle in question can be successfully applied, and if it can, it will certainly result in greatly cheapening the cost of conveying electricity for house illumination or for other purposes.

Roughly and popularly stated, the inventors who have been experimenting under the patronage of the Westinghouse Company claim to have found a method of making entirely practicable the delivery to the same wire of alternate currents from two or more dynamos driven by separate engines. If this can be done, it would certainly have great advantages over the ordinary "three-wire system" now in use. By the latter method the cost of certain copper wire for each 16-candle lamp is \$150 for a distance of four miles, while under the new system the cost would be only \$1.50. The armature, too, for a Westinghouse machine capable of producing a current for 1000 lights requires, in its construction, only 30 pounds of copper wire, as against 225 pounds for armatures of older styles.

Again, it will be to the advantage of the new system that under it there is no necessity of locating electric light plants near the center of illumination, where property is always costly and rents high; they may be placed at a con-

siderable distance away, wherever steam power can be produced more cheaply, or water power made available. These and other more technical advantages give some promise, at least, that the cost of electric lighting is to be cheapened. The fullest hope cannot be placed in the invention as yet; but its future development will be watched with an interest proportionate to the present desire for the supply of electric lights for domestic purposes at a reasonable cost.

## Some Remarkable Experiments.

M. Henri Mohlenbruck, writing to *L'Electricien*, describes some very remarkable experiments which he has recently performed, and which seem to show that in the mesmeric condition an electric current may have a powerful inductive action upon the human nerves. The experiments were made with an apparatus consisting of a ring of iron wires, wound with silk-covered copper, the latter being placed in circuit with a microphone and a battery cell. The ring was about nine inches in diameter. In the first experiment a watch was placed near the microphone, and the ring was placed upon the head of the mesmerized subject. He immediately began to beat time with the ticking of the watch. When the microphone contact was touched with a quill feather, he placed his fingers in his ears. The microphone was then removed to a distant apartment, and the connection of the circuit being completed as before, a violin was played in the distant room; the patient showed the most distinct indications that he heard the music. The next experiment was obviously to speak to the microphone. "To my great surprise," says M. Mohlenbruck, "the patient repeated the words." The last experiment described is that of sending a continuous current through the circuit. This had the effect of causing the patient to throw his arms around in a circle in the vertical plane. The direction of motion was reversed with the reversal of the current. When the patient was asked what he felt like, he said he was turning. M. Mohlenbruck concludes his letter by stating that he has made a great many more experiments not less interesting than these, and has constructed many different kinds of apparatus to aid in these researches. He promises to give further details if they appear to be of scientific value. We await these revelations with breathless interest.—*Electrician*.

CONDUCTIVITY OF ROSINS.—It has been ascertained that the ordinarily perfect insulators of the rosin type become more or less good electrical conductors when heated to softness or melting; afterward their conductivity increases with the temperature. A mixture of guaiacum with naphthalene, the latter a perfect insulator and of the same melting point as guaiacum, conducts much better than the rosin alone, being much less viscous. Oxidized or acid constituents in the rosin also increase their conductivity. Some always conduct very little, as Canada balsam, copal, mastic and dammar; Chios turpentine, pitch, asphalt, colophonium, are moderately good conductors when soft or melted. Styra, jalap, scammonin, dragon's blood, amber; the balsams of Peru, Tolu and copaiba; shellac, laudanum, aloes, myrrh, Venetian turpentine, are good conductors when melted.

THE FLUID ORIGIN OF NATURAL GAS.—It has been asked: Is natural gas confined in the earth in a fluid state? So thinks a Pennsylvania man, who has patented a plan for conducting this fluid to the surface and into receptacles for its preservation and carriage. A dispatch says with much truth: If this theory should prove correct it will be the greatest discovery of the age, as the fluid brought to the surface and confined at a pressure of say 600 pounds to the square inch, can be utilized to an inconceivable extent as fuel. A locomotive, for instance, with a few gallons of the fluid, would have a supply of fuel sufficient to run it from Pittsburgh to Chicago, and an ocean steamer would require only a few barrels to make the trip to Europe.

ELECTRICITY IN MEDICAL PRACTICE.—Quite a novel method of applying an electric current to the body forms the subject of a patent granted to the agent of Senor Pumariga, of Avile, Spain. The inventor steepes flannel in a bath composed of equal parts of oxide of iron, copper, zinc and tin, mixed in fine powder in weak gum water. The flannel thus takes up a quantity of the metallic oxides which are excited by the perspiration of the body, which is thus subjected to a weak but constant electric current. This would be a vast improvement on the electric belt system.

ANOTHER NEW ELEMENT.—Since the recent death of Professor E. Linnemann, of Prague, a description of a new metallic element has been found among his papers. The metal was obtained from the orthite of Ardenal, and is named "Austrium." It may throw new light on the constitution of the sun, as one of its spectral lines appears to be identical with one of the three unidentified lines in Anestrom's map of the normal solar spectrum.

TO DETECT ALCOHOL.—If any fluid is suspected of containing alcohol, add pulverized chromate of potash and sulphuric or muriatic acid and warm the mixture. If any alcohol is present, the mixture will turn green.

## A Year's Prospecting in Colorado.

The Denver Tribune-Republican says:

The season for prospecting for undiscovered mining claims has closed for 1886. With the exception of the gold discoveries in Larimer county, no new district has been reported. The time for finding new districts has passed. There is no part of the State which has not been tramped over many times by prospectors, and all which contain any considerable showing of ore are known. The Larimer county district is not a newly-found one. It was known years ago, but was not promising enough to lead to development. It is handicapped by a prejudice that seems to be well based upon observation; the country rock inclosing the veins is a coarse-grained, red granite, similar to that which prevails over all the mountain part of Northern Colorado, in which no rich ore veins have been found.

The year's prospecting has resulted in proving up the great value of the district at the head of Cross creek, and has added considerably to the knowledge of the mineral wealth of the La Plata mountains and Eagle county. Several rich telluride veins have been opened in the eastern portion of the La Platas, and that region has added to the production. The telluride ores are known to extend over a larger area than the tellurides of Boulder county, and they promise to, in the near future, add considerably to the annual yield of gold and silver.

The quartzite ore deposits of Battle mountain, in Eagle county, have proved to be extensive and rich. The overlying carbonate deposits on the lime contact have improved with development, and the veins in the underlying granite have become profitable producers. At Leadville, a large area of new and rich ground has been opened, and there has been an increase of product, as well as a growth in confidence, that the camp will be a lasting and heavy producer.

The carbonate ore deposits at Monarch, in Chaffee county, have developed splendidly.

The only places where performance has belied the promise are about Portland, in Ouray county, and some portions of Park and Summit counties. There the disappointments have not been great or serious, because expectations were based upon work by and sales to Eastern companies. Any one who has ever had anything to do with these Eastern concerns knows how unreliable they are, and how they can be relied upon to do the things they ought not to do, and leave undone the things they should do.

Aspen has developed some fine ore deposits, and gives an abundance of evidence that faith in the camp was not misplaced. It has not done so much as would have been done had not apex claimants retarded progress.

Altogether the season has been satisfactory, and when the books are closed on December 31 the product will be found to have been heavier in 1886 than during any previous year.

## Working Assessments.

The following is a copy of the new ruling in regard to the working of assessments for the year in which the application for patent is made. The circular is as follows:

GENERAL LAND OFFICE,

WASHINGTON, D. C., August 7, 1886.

To Registers and Receivers and Surveyors General: Your attention is directed to the following ruling of the Hon. Secretary of the Interior contained in his letter to this office, dated July 31, 1886, viz.:

"I am in receipt of your letter of the 26th ultimo, inclosing a letter addressed to you, inquiring as to the proper construction of paragraph 3, Circular N, Dec. 15, 1885 (4 L. D., 374), which is an extract from Departmental Decision in the case of the Good Return Mining Co. (4 L. D., 221) and which reads as follows:

"That compliance 'with the terms of this chapter,' as a condition for the making of application for patent, according to Section 2325, requires the preliminary showing of work or expenditure upon each location, sufficient to the maintenance of possession under Section 2324, either by showing the full amount for the pending year, or, if there has been failure, it should be shown that work has been resumed so as to prevent relocation by adverse parties after abandonment.

"Your inquiry concerns the words 'the full amount of work for the pending year,' and your letter construes them as meaning 'an amount sufficient to make the claim a valid and subsisting one at the date of the filing of the application for patent.' Said construction is correct. The exact meaning of the paragraph will perhaps more fully appear, from a slight transposition of its words, as follows:

"3. That compliance 'with the terms of this chapter,' as a condition for the making of application for patent according to Section 2325, requires the preliminary showing of work or expenditure upon each location, either by showing the full amount sufficient to the maintenance of possession under Section 2324, for the pending year, or, if there has been failure, it should be shown that work has been resumed so as to prevent relocation by adverse parties after abandonment.

"The pending year' means the calendar year in which application is made. And you will observe that the paragraph has no reference to a showing of work at date of final entry."

This ruling of the Department will be strictly observed.

WM. A. J. SPARKS, Commissioner.

## USEFUL INFORMATION.

**BLADES OF POCKET KNIVES.**—The blades of very cheap pocket knives, says *Mechanical News*, are punched in dies from sheet steel, but those for first-class pocket cutlery are hand-forged, a good workman being able to forge from 25 to 30 blades per hour and about 40 pen blades per hour. There is a pattern and gauge furnished the forger for each sort of blade, but the experienced workman rarely refers to either, his accuracy of eye and skill of hand being sufficient guides to exactness. The blades come from the hand of the smith perfect in form, except the bevel of the back intended to guide engaging blades, this bevel being formed by grinding. The steel used in these fine blades is Wardlaw's (English) or the best American made. As they come from the forges the blades are "choiled," or filed, to make a nick between the blade and the tang. Then the blades are tempered, having received the trade-mark stamp on the tang under a press. The hardening is done in an ordinary coke fire, the operator heating two at a time and plunging them in cold water. The drawing to temper is also done over a coke fire. If the blades are sprung in hardening they are straightened, after tempering, by repeated strokes of a hammer, having a thin face like the pene end of a machinist's square hammer, the blows being given on the concave side of the blade, as in the peening of cast iron, and with the same effect, that of stretching the hammered face. The blades are ground on Sheffield and Nova Scotia stones, "glazed" on emery wheels, honed or "set," and finally are polished on wheels of walrus hide fed with rotten-stone.

**CLAY AS A WATER PROOFING MATERIAL.**—A new mode of treating clay for use as a water-proofing material has, according to the *Builder*, been devised by Mr. Thomas Fraser, of Aberdeen, a gentleman interested in the manufacture of bricks and tiles. It is usual in puddling with clay, to prevent the penetration of water, to place the clay in trenches or between rows of sheet piling, in a plastic condition, mixing it first with water and tempering carefully before using. It occurred to Mr. Fraser to test the permeability to water of clay tempered with various proportions of water, and he found that when mixed with all the water the solid mass would take up, the clay was easily penetrated by liquids. It appeared also that as the clay absorbed moisture it increased in volume, and he reasoned from this that conversely if the volume were prevented from increasing, absorption would be restricted and the clay might be maintained with certainty at such a point of moisture as to have its maximum resistance to penetration by water. In order to accomplish this result it would only be necessary to put the clay in place in the form of fine dry powder, packed in so tightly as to be incapable of absorbing more than a certain percentage of water. In practice Mr. Fraser proposes to reduce the clay to very fine powder and pack it into trenches in the ordinary way. So treated, it is found when the water is allowed to reach it to absorb about 35 per cent of its weight, but the expansion due to this compresses the mass so much that it remains impenetrable.

**LIFE OF CAST-IRON PIPES.**—The fact is well sustained that the wear and tear by rust in uncoated cast-iron pipe exposed to the action of clean, fresh water on both sides is not more than one-eighth inch in three generations. With the present method of protecting such pipe with asphaltum, the life of the ordinary cast-iron pipe used in building construction may be greatly prolonged; indeed, even an ordinary coating of coal tar pitch, when properly applied, is sufficient to add at least a score or two of years to its durability. The life of a soil pipe, even when quite thin and uncoated, has been found by experience to be so great that it is not unreasonable to suppose that the greasy matter contained in sewage serves to coat and protect the iron from the corrosive action of the water and the acid component of the sewage. The defects and leakages more generally met with in such pipes are caused by the defective manner in which the joints are made and improper placing and securing.—*London Ironmonger*.

**A NEW SOAP** for cleaning surgical instruments and other articles of polished steel which have become flecked with rust by exposure in a show-case, is made by adding precipitated chalk to a strong solution of cyanide of potassium in water until a cream-like paste is obtained. Add to this white castile soap, in fine shavings, and rub the whole together in a mortar until thoroughly incorporated. The article to be cleaned should first be immersed, if possible, in a solution of one part of cyanide of potash in four parts of water, and kept there until the surface dirt and rust disappear. It should then be polished with the soap, made as above directed. Articles so treated look as "good as new."

**MANUFACTURE OF CELLULOSE.**—The manufacture of celluloid has made rapid advances since the first patents were taken out in 1870, and is controlled thus far by one parent company, which not only sells the crude article in bulk, but receives a royalty from net sales. A few years hence, after the United States patents have expired, a much larger development may be expected. While so much jeopardy exists in this industry from chemical reactions

in the midst of heat and friction, it is extremely difficult to obtain workmen who observe the requisite care.

**HATS FROM WOOD-PULP.**—By a new process of manipulation, hats more serviceable and finer than anything now on the market are made of wood-pulp. They are impervious to water, and not wanting in flexibility. It is claimed that felt hats will have to take a back seat as soon as the new hats can be placed in the market in sufficient numbers to supply the demand. They are certain to revolutionize the hatter's trade, as they can be molded into shape or style desired and colored to meet the taste of the public. They can be made to represent a glossy or nappy appearance.

**IRON IN RAILWAY CONSTRUCTION.**—More half of all the iron and steel produced in the United States since 1865 has been used in the construction and equipment of railways. At the present time the railway mileage in the United States exceeds that of the whole of Europe. While at the beginning of 1865 there were only 34,000 miles of railway in operation in this country, there are at present 130,000 miles. The railway construction of the present year will probably reach 7000 miles of new track.

**AN ELASTIC MUCILAGE.**—To make an elastic mucilage, dissolve one part of salicylic acid in 20 parts of alcohol, add three parts of soft soap and three parts of glycerine. Shake thoroughly, and add the mixture to a mucilage prepared from 93 parts gum arabic and the requisite amount of water (about 180 parts). This mucilage is said to keep well, and, when it dries, to remain elastic without tendency to cracking.

**MIXTURE FOR CLEANING GREASE SPOTS.**—Equal parts of strong ammonia water, ether and alcohol form a valuable cleaning compound. Pass a piece of blotting paper under the grease spot, moisten a sponge, first with water to render it "greedy," then with the mixture, and rub with it the spot. In a moment it is dissolved, saponified and absorbed by the sponge and blotter.

## GOOD HEALTH.

## Smoking and Heart Disease.

In a report by Dr. Frantzel, of Berlin, on immoderate smoking and its effects upon the heart, it is stated that the latter show themselves chiefly by rapid, irregular palpitation of the heart, disturbances in the region of the heart, short breath, languor, sleeplessness, etc. Dr. Frantzel says that, if the causes of these complaints are inquired into, it is generally found that the patients are great smokers. They may not smoke cigars rich in nicotine, but full-flavored cigars imported from the Havanas. Smoking, as a rule, agrees with persons for many years, perhaps for 20 years and longer, although by degrees cigars of a finer flavor are chosen. But all at once, without any assignable cause, troubles are experienced with the heart, which rapidly increase, and compel the sufferer to call in the help of a medical man. It is strange that persons consuming cigars of ordinary quality, even if they smoke them very largely, rarely are attacked in that way. The excessive use of cigarettes has not been known to give rise to similar trouble, although it is the cause of complaints of a different nature. The age at which disturbances of the heart become pronounced varies very much. It is but rare that patients are under 30 years of age; they are mostly between 40 and 60 years old. Persons who are able to smoke full-flavored Havanas continue to do so up to their death. If we look round among the better classes of society, who, it is well known, are the principal consumers of such cigars, it is astonishing to find how many persons with advancing years continue smoking. As a rule, affection of the heart has caused them to abjure the weed. In such cases the patient has found the best cure, without consulting the medical man. If he makes up his mind to discontinue smoking at once, the complaint frequently ceases at once; in other instances it takes some time before the action of the heart is restored to its normal state. In such cases, besides discontinuing smoking, relief must be sought also by regulating the diet, taking only easily digestible food, light beer and wine in moderate quantities, abjuring coffee, as well as by short walks, residence among mountains of moderate elevation, and suitable interior treatment. By taking this course, all symptoms disappear in the course of a year and do not reappear if the patient does not recommence smoking. In a third category of cases the more acute disturbances leave the patient; he feels well and hearty, but an irregularity of the heart, more or less pronounced, is left behind. It has not yet been determined what it is that makes smoking injurious; but this much appears certain, that it does not depend upon the amount of nicotine which cigars may contain.

**THE SECRET OF SCARLET FEVER.**—Certain English physicians have made a most important discovery. They have found that the scarlet fever poison really comes from diseased cows. The contagion is not necessarily in the milk. Indeed, a cow impregnated with the fever may give wholesome milk, but there is always dan-

ger that in milking the cow the matter from the sores on the udder may find its way into the milk-pail. Then comes the rapid multiplication of the scarlet fever germs, which technically are known as "streptococcus." These germs have been transmitted to calves and other animals, which have thereupon shown the symptoms of scarlet fever. The disease is so deadly an enemy of the human race that now we have discovered its origin every effort will be made to put an end to its depredations. The cow is of the greatest benefit to the human race, but the milk it furnishes sometimes communicates the infection of typhus as well as scarlet fevers.

**LOSS OF MEMORY.**—The loss of memory in the aged is a familiar example, says Dr. M. L. Holbrook, and can only be accounted for by a deterioration of the brain elements and a diminution of blood supplied to them. One of the worst features of such cases is the fact that an old person is not, for a long time after decay has begun, aware of it. I am now treating a case of loss of memory in a person advanced in years, who did not know that his memory had failed most remarkably until I told him of it. He is making vigorous efforts to bring it back again, and with partial success. The method pursued is to spend two hours daily, one in the morning and one in the evening, in exercising this faculty. The patient is instructed to give the closest attention to all that he learns, so that it shall be impressed on his mind clearly. He is asked to recall every evening all the facts and experiences of the day, and again the next morning. Every name heard is written down and impressed on his mind clearly, and an effort made to recall it at intervals. Ten names from public men are ordered to be committed to memory every week. A verse of poetry is to be learned, also a verse from the Bible, daily. He is asked to remember the number of the page in any book where an interesting fact is recorded. These and other methods are slowly resuscitating a failing memory.

**A NEW ANÆSTHETIC.**—Prof. O. Brunter, of Germany, who is at present at Underwood Springs, near Portland, Me., performed a series of interesting scientific experiments recently, the object of which was to demonstrate the value of a new anæsthetic, which seems to possess wonderful virtues. Prof. Brunter first transformed German water-gas into snow, and then into a mass of beautiful white crystal, resembling ice, but in reality a local anæsthetic, so powerful that a single touch completely benumbs the member, arrests the flow of blood, and enables the subject to endure any operation without suffering or any considerable loss of blood. One individual was given too prolonged a touch on the back of the hand, when he found that the hand was devoid of all feeling. For four hours needles inserted caused no pain, and yet the hand was not powerless. No blood followed the puncturing. It is claimed that this gas will take the place of ether. No ill-effect except the possibility of blistering follows its administration. The gas is to be bottled at the Underwood Springs.

**OVERSTUDY.**—School-girls of the present day are too often overtaxed. Think of an undeveloped brain getting up book knowledge on ten different subjects all the same day, and this going on day after day for several years! It is altogether contrary to the principles of a sound psychology to imagine that any sort of mental process worthy of the name of brain thinking can take place in that brain while this is going on. The natural tendency of good brain at that age to be inquisitive and receptive is glutted to more than satiety. The natural process of building up a fabric of mental completeness by having each new fact and observation looked at in different ways, and having it suggest other facts and ideas, and then settle down as a part of the regular furniture of the mind, cannot possibly go on where new facts are shoveled in by the hundred, day by day. The effect of this is bad on boys, but it is worse on girls, because it is more alien to their mental constitution.

**SHADE TREES CAUSE SICKNESS.**—The shade trees about our dwellings have done much to make our wives and daughters pale, feeble and neuralgic. Trees ought never to stand so near to our dwellings as to cast a shade upon them. If the blinds were removed, and nothing left but a curtain with which to lessen on the hottest days the intensity of the heat, it would add greatly to the tone of our nerves and to our general vigor. The piazzas which project over the lower story always make that less healthful than the upper story, especially for sleeping purposes. I have cured many cases of rheumatism by advising patients to leave bedrooms shaded by trees or piazzas and sleep in rooms constantly dried and purified by the direct rays of the sun.—*Dio Lewis' Journal*.

**A NEW DISINFECTING COMPOUND** for purifying the atmosphere of the sick-room has just been presented to the Berlin Medical Society. Oils of rosemary, lavender and thyme, in the proportion of 10, 2½ and 2½ parts respectively, are mixed with nitric acid in the proportion of 30 to 1½. The bottle should be shaken before using, and a sponge saturated with the compound and left to diffuse by evaporation. Simple as it is, the vapor of this compound is said to possess extraordinary properties in controlling the odors and effluvia of offensive and infectious disorders.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**MILL SOLD.**—Amador Ledger, Nov. 27: The 10-stamp mill of the Tellurium has been sold, and is now being hauled to Camp Seco, Calaveras county, to be erected on a quartz mine in that vicinity. This disposes of all the surface improvements made at the Tellurium. Most of the machinery has long since been taken out and stored at Pine Grove; the framework of the mill is now being torn down preparatory to removal. Spagnoli Bros. have purchased 300 feet of pipe from the Tellurium Co., and it is now being removed to be placed in position for their new mill above Clinton. The Volcano Gold Gravel Mining Co. have just had a donkey-engine placed in position at their claim at Volcano, for the purpose, we presume, of hoisting gravel in spots considerably below the tunnel level. The rain last Saturday and Sunday was not sufficient to materially affect the water supply of the Amador canal.

**RICH ROCK.**—Calaveras Chronicle, Nov. 27: Judging from the splendid specimens of rock shown us the other day by our townsman, Wm. M. Nuner, Esq., that gentleman is the owner of a half interest in a very rich mine. We have made mention of this property some time ago. It was named the Riverside mine, situated in Hundred Ounce gulch, north of the town, on the Amador side of the river. Work was suspended on the mine during the last three months, pending a sale, but the parties failing to come to time with the cash, Messrs. Nuner & Lowry have resumed work. The lead, which is from 2½ to 3 feet wide, has been uncovered a distance of 75 or 80 feet, and all along shows rock rich in free gold.

**SUTTER CREEK.**—An accident occurred at the Mahoney mill the latter part of last week, causing a delay in the dropping of the additional 10 stamps. The cam shaft broke, bringing a portion of the mill to a standstill. The necessary repairs are almost completed, and it is expected the 10 stamps will be started to-day. Knight & Co. have just taken a contract to build a large derrick for the Lambing gravel mine near Lone City. The derrick will weigh in the neighborhood of 65 tons, and will have a lifting capacity of seven tons. The same firm has also engaged to make two or three dredges for the same mine. The South Spring Hill mill was started this week. The additional 10 stamps are about completed, and will be set in motion shortly if the water supply will permit. Water in the Amador canal is still very slack.

## Fresno.

**HILDRETH NEWS.**—Cor. Fresno Examiner, Nov. 26: Excitement prevails among the mining population, occasioned by daily discoveries of quartz ledges that prospect from \$20 to \$60 per ton free gold, and in some cases are pregnant with sulphurets. The surrounding hills are being industriously prospected by quite a number of mine-hunters. This section is noted for rich surface prospects of free gold, principally in quartz formation, and with two exceptions, white talc containing blue streaks accompanies the ledges in selvages of from one to two feet, which prospects to an astonishing amount. Prospects are changing hands from the locator to the capitalist; but in regard to the most valuable locations, prices are being asked that are out of all common sense, according to the judgment of San Francisco mining men, which is keeping good property from development. At the James mine, a clean-up was made in the astras yesterday. From a run of five tons of ore, \$1000 was the amount produced. This property is the richest mine in the district. The owners are sinking on the ledge, which is four feet wide, with selvages of talc, porphyry and sediment of three feet that assays \$60 per ton. The present depth of the incline shaft is 145 feet. The McNally ledge, in the shaft below the 500-foot level, has widened out to four feet of good ore. Some say they can judge the increase and decrease of the ledge daily by the length of Mac's smile. The Wilson mine shows up a fine ledge of very rich ore in the shaft with well-defined walls. This mine is next to the James mine in richness. San Francisco mining men have made some high offers for this property. Louis does not want the world because he has no place to put it. Chas. Taylor and N. Niven, while prospecting on the west side of Fine Gold river, uncovered an eight-foot ledge of quartz that contains galena sulphurets that assay \$600 per ton. The ledge in one place is 28 feet wide, which seems to be a blow-out, and if the ledge prospects \$6 to the ton in free gold it is a big thing.

## Inyo.

**WAGES.**—Register, Nov. 25: The Darwin mines are paying good wages, as mining wages go in these days of reductions. The Deference and other mines pay \$3.50; the Modoc mines work two eight-hour shifts, at \$3.75 per shift.

**TO SHIP TO RENO.**—Inyo Independent, Nov. 26: Most of the miners in Inyo county who are taking out lead and silver ores are making arrangements to send their ores to the new reduction works at Reno. It is reported that some shipments of gold ore will also be made.

## Nevada.

**MINING IMPROVEMENTS.**—Transcript, Nov. 27: The 10-stamp mill on the Baltic quartz mine near Graniteville, in this county, is being enlarged by the addition of 10 stamps more. Another tunnel is being run to tap the ledge 500 feet below the present tunnel. The Baltic is said to be giving good returns now. It is owned by an incorporated company principally consisting of Oakland men, and E. W. Roberts, formerly of the Buck claim at Moore's Flat, is superintendent.

**THE DELHI STRIKE.**—North San Juan Times, Nov. 27: The rich strike made in the Delhi mine the other day gladdened many a heart in this portion of God's country. It made owners, employees and everybody else who cares for the prosperity of the Ridge, and who is not envious of the prosperity of his neighbor, feel happy.

**A DEBRIS DAM.**—Nevada Transcript, Nov. 26: A large dam made from wood and stone, and calculated to hold two years' washing of "slickeys," is

being constructed at the Omega gravel mine in this county. Twenty thousand feet of heavy timbers are to be used in making it. It will be as solid as the rocks on which it is to stand.

**LOCATING FOR SILVER.**—Grass Valley Union, Nov. 30: The recent favorable prospects for silver ore over on Greenhorn creek have started something of an excitement, and in consequence numerous claims have been located. The fact that much of the land is held under agricultural patents has not deterred locators from posting their notices. Some of the notices are amusing compositions, showing an intention to locate about all creation in order to make sure of a silver lead. In the prospects already obtained ruby silver is shown in good quantity from a lode that at present shows a width of four feet.

**AFTER A QUARTZ MILL.**—Transcript, Nov. 24: Pat. Campbell, owner of the Golden Gate gravel mine, near Smartsville, was in town yesterday negotiating for a 10-stamp quartz mill. He proposes to hereafter work his claim by the drifting process, and as the gravel is cemented together will be obliged to crush it before the gold can be washed.

**HORSESHOE MINE.**—Foothill Tidings, Nov. 27: Yesterday the miners struck a good vein of ore in the north end of the north drift of the Horseshoe. The ledge is six inches in width, and is full of mineral, with occasional glimpses of free gold. This ledge is 208 feet below the surface, and is 32 feet from the shaft. A large stream of water gushes from the ledge, which is considered a good indication. Some of the rock was brought to town and can be seen at W. K. Spencer's.

## San Bernardino.

**JENNY LIND MINE.**—Calico Print, Nov. 28: Operations on this claim are increasing in activity and the chlorides are all doing well with plenty of ore in sight of a fair grade. There are 20 miners at work on the several leases taking out about 12 tons of ore per day of about 60-ounce rock. Over \$2000 in royalties are now due the owners for the past seven weeks' work. Work on the Iron Clad is still progressing in good shape and undoubtedly will be permanent and dividend-paying. A rich strike is reported in the Little Waterman. This mine has paid its owners handsomely from the start. Chloriding in East Calico and all over the camp, in fact, never was in a more flourishing condition than at present.

## San Diego.

**JULIAN MINES.**—Cor. San Diego Sun, Nov. 20: Since your last published report of mining operations in this district some valuable accessions have been made to the bullion producers.

**THE STONEWALL.**—Since its change of owners, arrangements are being perfected to increase its milling capacity from 10 to 20 stamps. The assured continuance of its large ledge and high grade of ore warrants its enterprising management in placing it on the roll of first-class gold mines.

**THE OWENS.**—This mine, under its present efficient management, bids fair to rival the Stonewall as a bullion producer. Recent discoveries in its lower levels of large bodies of marvelously rich ore sustain previously expressed opinions of the high character of its formation and its permanency as a true fissure ledge; its main shaft is now being sunk with vigor, when a juncture of its two ledges, Nos. 1 and 2 are reached—forming a ledge seven feet wide—more water may be found available to keep its 10 stamps continuously running.

**THE OROFLAME.**—Its large ledge of fairly average ore, its perfect mill—10 stamps—its efficient management, guarantees an output of bullion of no mean proportions.

**THE BLUE HILL OR GARDINER.**—This famed mine, under its indefatigable owner, still yields its abundance of marvelously rich ore. The last crushing—some 20 tons—having yielded only \$80 per ton, is by no means a fair average yield. This mine has produced over \$150,000 from about 1500 tons of ore reduced.

**THE ARGONAUT.**—This mine immediately adjoins the Blue Hill or Gardiner, on the west and north. The ledge of high-grade ore forms the Blue Hill or Gardiner, traversing the Argonaut limits. On it working has been resumed, disclosing a ledge of valuable ore.

**THE ELLA.**—The tunnel to tap this famed mine is now in some 600 feet. As the distance to this ledge is expected to be made within two months, you may expect in the near future a large increase in the bullion products of this district. The Pocohontas, the Gipse, the Hubbard, the Tarwater and Stratton locations and others of no less prominence are being worked with prospects of flattering results. A rich gold yield is here inviting the aid of small capitalists to rescue from its primitive condition that which is the main factor to their ambition, to commerce and trade.

## Shasta.

**COPPER CITY.**—Republican Free Press, Nov. 29: C. C. Jones, of the Old Winthrop mine, has let the contract for getting out timbers, with a view to starting mining operations. As soon as the contract is completed, Mr. Jones will come up from San Francisco and put a number of men to work. So, you see, we are likely to have another boom here.

**MILL.**—Shasta County Democrat, Nov. 24: Paul's 12-stamp quartz mill, and other machinery, arrived last week. Mining matters are looking up again. Quite a number of capitalists are in the county looking for investments. It is reported that Camden, Magee & Co. gave \$10,000 for the fine 20-stamp mill, and all the rest of the machinery erected on the Lost Confidence mine, by Col. Elsworth. This plant originally cost \$125,000. Weil, Conroy & Co. have, for the past three months, been running a tunnel on the Ballakala mine, and last week struck an immense body of ore, much of it being high grade. The proprietors are highly gratified with the late developments on this mine. Bob Kennedy is developing a very promising free gold prospect, about a quarter of a mile north of the Muchmore mine, near lower Springs. The vein is well defined, and yields as rich ore as any one would care to see. Andy Fife is piping water across the river, at the mouth of Spring creek, from the old Spring creek ditch to his Huntington mill on the east side. By this means he gets sufficient water power to run 50 or more stamps. We are told that Mr. Fife will prepare his plant to do all the custom work he can

get. The proprietors of the Snyder and Last Chance intend to commence another tunnel 300 feet lower than the old tunnel, at a point where the veins crop and show rich free gold. This new tunnel will satisfactorily prove the length and extent of the ore body, now partly exposed by the upper tunnel—or, in other words, it will expose an ore chute from 450 to 500 feet in length, and at the lowest level at least 350 feet in depth.

## Sierra.

**THE PHOENIX.**—Tribune, Nov. 29: The main tunnel is in 700 feet. The crosscut on the west side is about 65 feet, and that on the east side about 55 feet. The indications are said to be excellent. The boarding-house will be ready for occupancy in a week. Nearly 100 men are employed in and about the mine. In the gravel-claim of John Sorocco, Wm. Neville, and others near Johnstown, a well-defined quartz ledge has been found, the rock of which prospects very well. No. 2 tunnel at the Young America mine is in about 125 feet. Only 65 men are at the mine. The mine never looked better.

**PROSPECTIVE SALE.**—A wealthy company has been formed in Scotland to purchase the Gibsonville ridge, and develop the rich gravel mines there. One of the company recently spent several days in and about Gibsonville, and seemed well satisfied with the outlook. The purchase price will be in the neighborhood of \$1,000,000. It is said that the company also intend making an examination of several promising quartz mines in the vicinity of Sierra City, with the idea of purchasing.

**THE EMPIRE MINE.**—About 375 feet of tunnel has been run at this mine. Only a few men are now employed. It may be given out as a fact that the company will erect an 80-stamp mill and chlorination works in the early part of next spring. The company is justly sanguine as to the future of the mine.

**1001 GRAVEL MINE.**—Operations in this mine will be commenced anew in a few days. Notwithstanding that over \$60,000 has been spent by the present company in prospecting and developing the mine, operations of an expensive character will again be indulged in. An assessment will soon be levied.

**GOLD CLIFF MINE.**—Excellent reports are received from this promising property. The tunnel is in 15 feet on the lode which is 4 feet in width, and widening out as work progresses. By running 300 feet along the vein from the mouth of tunnel, the owners expect to encounter the shaft. Many years ago a portion of this mine was worked by Mexicans with good success, astras being used. Winter supplies have been laid in, and work will steadily continue. Surveyor C. W. Hendel is the principal owner. The mine lies in Gold Valley, and is but a short distance from the Empire. Work at the Cleveland mine has been partially suspended. Some trouble exists between the mine-owners and the creditors of the mine.

**BUNKER HILL.**—Mountain Messenger, Nov. 27: The Bunker Hill Co., at Newark, has its outside work all done and is about ready to commence taking out pay gravel. We hear that some excellent prospects have been obtained. The tunnel of the Goodhope is going steadily ahead with the prospect that 150 feet more will tap the ledge a long way below the old works. The water is not as troublesome as it was a short time ago.

## Sonoma.

**MARK WEST COAL MINE.**—Santa Rosa Democrat, Nov. 26: Messrs. King & Killis, of the Mark West coal mine, are much encouraged over the promising indications of a paying coal mine. Five veins have been opened so far and several tons of coal have been taken out. Mr. Killis stated to a reporter, Friday, that they could take out 50 tons at once, but prefer to go deeper in order to get to the better quality of coal supposed to be in the hill. That which is on the surface, from being exposed to the atmospheric changes, is inferior to that mined at greater depths. An experienced miner by the name of West has been engaged to superintend the work.

## Trinity.

**WAITING FOR WATER.**—Trinity Journal, Nov. 27: Hydraulic miners in all districts of Trinity county are said to have their claims in working order and only await the coming of storm and a plentiful supply of water to begin active operations. It has generally been complained of late years that early fall rains ruined the mining season; but this year has been remarkably dry, wherefore we may reasonably hope for proportionately increased storms later on.

## NEVADA.

## Washoe District.

**CON. CALIFORNIA AND VIRGINIA.**—Virginia Enterprise, Nov. 27: About 400 tons continues to be the daily output of ore from this mine, reduced at the Morgan and Eureka mills, assays from battery samples averaging about \$47 per ton. Twenty-five bars of bullion, weighing a ton and a half, valued at \$110,000, were shipped to San Francisco last evening. On the 1650 level the upraise above the east crosscut is in a good quality of ore and being carried to a connection with the good ore development in the levels above. The drift southwest from the C. and C. shaft has been advanced to the total extent of 555 feet. On the 1600 level the lateral drift south from the north end of the mine is in 380 feet, running in favorable working ground. On the 1500 level the lateral drifts running north and south from the Old Con. Virginia shaft are making good progress, the ore north being 212 feet in length, and the south drift 336 feet. On the 1435 level, at the end of the east crosscut, which has reached the east clay of the ore body, a station has been cut out for a winze to be sunk to the 1550 level to ascertain the boundaries of the ore in that direction. On the 1300 level the north drift from the Con. Virginia shaft is in 360 feet.

**POTOMAC.**—The southeast drift from the Chollar line, on the 250 or Old Potosi tunnel level, is in 60 feet from the line, all the way in good ore. Two crosscuts, east and west, a short distance back from the face of the drift, have been made to ascertain the width of this fine ore vein. Each is in nearly 12 feet, showing the extent of the ore in either direction, and defining the vein to be about 25 feet in width. It still shows well in the face of the main drift. The ore mentioned in last week's report as being found 300 feet south of the Chollar south line,

is in what is known as the Lindsay drift, which is being run in a northwesterly direction, and only day before yesterday it cut through into the Old Potosi upper workings, carrying the same character of ore all the way through, the entire length of ore being 95 feet. This is all high-grade ore, and its width will now be explored and ascertained. It is an important development, with extensive possibilities. A drift is now to be made from the Lindsay drift to connect with the Old Potosi tunnel for air circulation, etc.

**HALE AND NORCROSS.**—Since the cessation of work through the Combination shaft, the main shaft of the company has been reopened and well repaired to the 1300 level, with new timbering where required, new stage guides, etc. The incline is also being repaired to the Suro tunnel level. Some of the old upper levels of the mine are now being reopened for the resumption of exploration after ore bodies left behind years ago in the popular desire to sink deeper after bonanzas. The old second station level has been reopened but a short distance, the drift running to the southeast. The seventh level is also being reopened, repaired and straightened up. The eighth level has been reopened and repaired to the distance of 40 feet southeast. More or less good-paying ore was found in former times on all these levels, and it certainly is to be hoped still more will now be found.

**CHOLLAR.**—The principal work is confined to cleaning out and repairing the old shaft, the surface or top of which is on D street, just south of the office of the company. This work has been done as far down as the 250 station, which is one of the old working levels of the mine. The timbering is considerably out of repair, but it will soon be renewed and straightened up. Below the 250 station the shaft is found to be clear for a distance of 102 feet, below which point it is filled solid with debris, apparently. A strong flow of water comes in at the 250 level, but it is surface water, which will necessarily drain out in a short time. From the floor of the works or surface of the shaft to the Old Potosi tunnel is 50 feet; to the old drain tunnel, 80 feet farther, or 130 feet, and to the bottom of the vertical shaft, 960 feet in all. The ore found in the southeast drift near the Chollar and Potosi line proves to be in Potosi ground.

**ANDES.**—Steam was got up in the hoisting works a day or two since, and the machinery found to be in perfect working condition, starting off first rate. It will take three or four days yet to make the few necessary repairs to the shaft guides and other arrangements down to the 350 level, which is the present objective point of attack. Some good ore is known to exist on that level, which was passed by in the desire for deeper working, and this ore is considered desirable now. Meanwhile, in exploring it some ore of higher grade might very possibly be found. The total depth of the shaft is 615 feet.

**SAVAGE.**—On the 500 level the south lateral drift is in 150 feet from the upraise above the 600 level at the Gould and Curry line. The last 40 feet of it is in pretty good ore. On the 600 level the south lateral drift is 680 feet in length, and 80 feet further will carry it to its desired connection with the main Savage shaft. It has been turned away eastward from the ore vein for that purpose. On the 800 level the lateral drift runs about southeast, and is 300 feet from the Gould and Curry line. It is in very favorable-looking vein material at the present time, showing ore of rather low grade.

**ALTA.**—On the 725 level the north lateral drift in Lady Washington ground, and the south lateral, also following along the Keystone vein, are making good progress, and both are in vein matter carrying streaks and bunches of ore. The winze being sunk below crosscut No. 2, west in the main Alta vein, is now down 108 feet. A little water is coming in at the bottom, but not sufficient to seriously interfere with the progress of sinking. This winze follows the dip of the vein at an angle of about 55 degrees.

**BEST AND BELCHER.**—On the 600 level east crosscut No. 2 has been advanced 75 feet, and the drift northeast from east crosscut No. 1 has been extended 22 feet, making a total of 189 feet. On the 800 level, at the line of the Con. California and Virginia, an east crosscut has been started from the end of the main north lateral drift, which is now out 38 feet.

**ALPHA AND EXCHEQUER.**—The grading and other preparations in commencement of placing the requisite steam-hoisting machinery over the shaft are going vigorously ahead at the old Alpha shaft, through which it is proposed to work both of these mines.

**SIERRA NEVADA.**—On the 520 level east crosscut No. 5 from the north lateral drift has been advanced 49 feet, making a total distance of 236 feet. It is now in a more favorable formation for finding ore, the material being softer and carrying quartz giving low assays.

**CROWN POINT AND BELCHER.**—About 375 tons is the regular daily yield, principally from the 1600 level, with a small proportion from the 1700 and the levels above, keeping the Mexican, Santiago and Vivian mills steadily running.

**YELLOW JACKET.**—About 150 tons continues to be yielded daily, of low-grade ore, from the 1300 level and some of the levels above. The reopening of the lateral drift north on the 1400 level is making good progress.

**OCCIDENTAL.**—The upraise to connect the lower with the upper tunnel is now up about 100 feet in hard quartz. A few tons daily of low-grade ore continue to be extracted from the upper tunnel for milling.

**UTAH.**—On the 472 level the main west drift is 432 feet in length, 57 feet having been added since last Friday's report. Material in the face, clay and porphyry, with small quartz seams.

**OPHIR.**—On the 1065 level, the excavating of the shaft station is well advanced. About 300 tons of ore daily are being hoisted through this drift for the Con. California and Virginia.

**KENTUCK.**—Daily yield 60 tons, most of which comes from the 800 level, keeping the Rock Point mill steadily running. A dividend of 10 cents per share was declared yesterday.

**GOULD AND CURRY.**—On the 425 level the old south lateral drift has been cleaned out and retimbered 40 feet further, making a total distance of 233 feet.

**OVERMAN.**—The hoisting engine and other sur-

face machinery at the old shaft are being put in order for active resumption of work in the old upper levels of the mine.

**UNION AND MEXICAN.**—The joint lateral drift north from the station in the Ophir drift, on the 1300 level, is progressing well in favorable ground.

**BULLION.**—The surface machinery is being placed over the old Croesus shaft, preparatory to explorations at that point after the low-grade ore known to exist there.

**JUSTICE.**—The drift run into the south portion of the mine from the old Woodville shaft is in low-grade ore.

**MONTE CRISTO.**—The upraise above the 150 level from the new shaft is making slow progress in very hard rock.

#### Hawthorne District.

**THE NORTH STAR CONSOLIDATED.**—Walker Lake Bulletin, Nov. 26: The ledge in the North Star Consolidated has been struck on a lower level, and as it is of the same quality the value of the mine is vastly increased. As soon as a mill starts work in the Hawthorne district this mine will be one of the richest and most productive in the State.

**THE HINDLEY.**—Another body of rich ore has been struck in the Hindley mine, near the end, and running into the claim. This is of the same quality as the very rich rock previously extracted and will make a nice lot of dividends; in the meantime the owners have been shipping what they call second-class rock, which would be considered as remarkably first-class ore in most mining districts.

**A RED CANYON MINE.**—Senator Danberger is working the Golden Era mine, in Red canyon, with encouraging results and has several men at work. They are now sinking a shaft on a ledge of very rich gold ore. The Golden Era is situated near the well-known Golden Belt mine, owned by Williams & McKnight, and from which was taken so much rich specimen rock two years ago.

#### Jackrabbit District.

**IMPROVING.**—Pioche Record, Nov. 20: From a party, recently having made a visit to the Onondaga mine, Jackrabbit District, we learn that the mine, during the week, has steadily improved both as regards the quantity and quality of the ore, a great many tons of which have been taken out within the past four days. A frame building has been put up on the dump, to be used as an orehouse, for assorting and sacking purposes. Here's success to the Onondaga boys; they deserve it, and a big one, too.

#### Kinman District.

**THE NORRIS MINE.**—Virginia Enterprise, Nov. 30: J. W. Norris, locator of the mine of that name in Kinman District, on the western slope of Mount Davidson, returned last Saturday after an absence of several months in Montana and Idaho, where he claims to have discovered, through the agency of the divining rod, numerous veins of ore assaying high in gold and silver. The shaft on the Norris Consolidated is now down 335 feet below the surface. The formation in the bottom is said to indicate the proximity of an ore vein. Notwithstanding the principal owners in the mine have expended a large sum in prospecting it to its present depth without realizing a cent on their investment, their faith is still unshaken in the infallibility of the power of the divining rod—when manipulated by their apostle Norris—to detect the presence of precious metals below the surface. Sufficient supplies have been delivered on the ground to operate through the winter.

#### Pioche District.

**PIOCHE CON. LEACHING WORKS.**—Pioche Record, Nov. 20: The Pioche Consolidated Leaching Works, under the contractor's supervision, W. T. Rich, are rapidly approaching completion. These works are being constructed on a larger scale than they were supposed to be, and it is evident that the Pioche Consolidated Mining Co. has come to stay, and again place Pioche in the leading ranks as a bullion producer. From a flying visit we were able to obtain the following in regard to the leaching works: They are to be of 60 tons capacity, and everything throughout is to be constructed on a labor-saving principle. The roll and engine-room is 28x30 feet. The ore is to be run from the mine to the works in cars, and it then goes directly into a separator, the fine going into a large bin of 100 tons capacity and the coarse is conveyed back by an elevator and is then run through what is called the bolter, which again separates the ore, the fine going into the bin and the coarse is carried back by the elevator over and over again until it is all run through and deposited in the bin. The leaching-room is 52x40 feet, the tanks occupying the space, which are fed by chutes from the bin, the tailings being dumped over the road, where there is sufficient dumping-room, and it was on this account that the site was chosen.

#### Rebel Creek District.

**EXCELLENT PROSPECTS FOR GOOD MINES.**—Silver State, Nov. 30: Rebel Creek District, which is sometimes called Yellow Creek, is situated about 50 miles north of Winnemucca on the Idaho road. It was discovered some years ago by F. P. Snapp and Joseph McColley, who located the Ohio mine. Subsequently several other mining locations were made, some of which have been worked to a considerable extent and produced large quantities of rich ore. The district is comparatively unprospected, however, and new locations are being made by prospectors. Among the recent discoveries is a lead found by Chris. T. Raabe and named the Bismarck. It is a gold-bearing ledge, which can be traced by croppings along the mountains for 15 miles in almost a due northerly direction. The formation is talcose slate, through which the lead in many places crops from 10 to 20 feet wide. The ledge is located by different persons and companies for a distance of seven miles, the Bismarck being the most southerly. Mr. Raabe has stripped the ledge for some 40 or 50 feet along its course, and prospected it by a shaft to the depth of 15 feet. The lead at that depth is over 10 feet wide, and while all of it carries more or less gold, the rich streak is from 18 to 30 inches thick. The ore in this streak carries free gold, which is plainly visible to the naked eye, and some of the quartz carries almost sufficient gold to make it valuable for jewelry. Mr. Raabe, who is now here attending court, has several specimens of the quartz, which are literally covered with gold, one piece weighing a little over an ounce being valued at \$10. He intends to keep

developing his mine, as he can work enough of the ore in a mortar of evenings to pay all his expenses and have a little left for a rainy day. The Choate Brothers, who own the next claim to the Bismarck, have a tunnel in 80 feet on the course of the lead, with good ore all the way. The mine is called the Planet, and it produces ore enough to pay for running the tunnel. Adjoining the Planet is the Mammoth, owned by Shrewsbury & Wilson, who have a tunnel in 25 feet on the lead, and are now sinking a 50-foot shaft at the end of the drift. They have rich, gold-bearing quartz, and work enough of it in an arastra to pay expenses. Sooner or later capital will get into the district and make it one of the liveliest mining camps on the coast.

#### Taylor District.

**A NEW STRIKE IN THE ARGUS.**—White Pine News, Nov. 27: As we are ready to go to press, we learn that an important strike has been made in the Argus mine. They have been getting at it for several days, but it was only yesterday that it opened out. Of its size we are not advised, as the management themselves do not yet know.

#### Tuscarora District.

**BELLE ISLE.**—Tuscarora Times-Review, Nov. 25: Crosscut west, 150-foot level, extended 27 feet. Crosscut east, same level, extended eight feet.

**TORNADO CONSOLIDATED.**—We have advanced 11 feet in tunnel during last week. The ledge twisted from its regular course, and the ground is therefore very tight and unkind.

**NAVAJO.**—South drift, from No. 5 crosscut, east vein, 250-foot level, has been extended five feet. No. 1 winze, on vein west of east lateral vein, same level, has been sunk six feet; total depth 22 feet.

**NORTH BELLE ISLE.**—North gangway on the 300-foot level has been extended the past week 30 feet. The formation is a lively looking quartz porphyry, and very close and hard. Fair progress has been made in extending north drift from No. 1 crosscut, 150-foot level. Very rich ore is being followed north, and looks favorable to continue to the north line. No. 3 winze has reached a depth of 23 feet, and is yielding some very rich ore. The ore strata in the vein continues about the same. The ore is a little higher grade.

**NEVADA QUEEN.**—Shaft has been sunk eight feet. It is hard, but breaks well. There are 3000 gallons of water every 24 hours. Will make better progress now, as everything is in good running order. South drift from No. 2 shaft has been advanced eight feet; only working one shift here. Ore is four feet thick, and continues fully as rich as ever. Crosscut from north gangway, 150-foot level, has been extended 25 feet. Indications are that we will have to go 25 feet farther, provided that the vein does not vary its course. There are seams of ore in the face which look very favorable. Everything around the mine is running smoothly.

#### Union District.

**GOLD MINE.**—Belmont Courier, Nov. 26: Theo. Cirac is expected to return to Grantsville, from San Francisco, with a party of capitalists, to look at his gold mine in Union district. There is a streak of ore in the ledge in this mine that gives assays of over \$60,000 per ton. Union mining district is prolific in ledges that carry gold and silver and other metals. Grantsville and Lone City will yet be the centers of immense mining operations.

#### ARIZONA.

**NEVADA MINE.**—Prescott Courier, Nov. 26: The above-named mine is in Groom Creek district, about six miles south of Prescott. It belongs to Mr. Wm. N. Kelly and others, of Prescott. Mr. John Hutchins prospected it enough to satisfy the other owners that it was a mine. It carries gold in paying quantities, and the vein is of good size. Not long since, Mr. Riley, a real quartz miner, leased it, went to work and has to-day, at least, \$5000 worth of rock as his share. Owners have much more and are satisfied. Now, there are many other properties in this section, quite as good as the Nevada; but it will take work to make them remunerative. So we say to other mine-owners, don't fritter away labor on several ledges. Select the best, work it, and you will receive your rewards.

**MOHAVE CO. MINES.**—Miner, Nov. 24: J. J. Hyde made another shipment of ore from the Keystone dump last Monday. Jas. W. Michaels has leased the first north extension of the Rainbow mine, and put several men to work on it last Friday. The Minnesota mine, near Chloride, is producing considerable high-grade ore. No less than nine heavily loaded wagons left Kingman on Wednesday last, with lumber, provisions and mining supplies for the different mines in this district, and all of them came in loaded with ore. Messrs. Bassett and partners will make quite a shipment of chloride ore from the Crosscut claim in a few days. This claim is about half a mile east of town, and the present shipment is the result of three or four months' work. Messrs. Young & Evans are sinking a new shaft on the Sabbath Bell mining claim. This mine is situated about half a mile east of Mineral Park, and has had considerable work done on it in former years. The ore streak in the bottom of the old shaft is about eight or ten inches wide, and assays from \$100 to \$150 per ton. A large quantity of ore has been run through the sampling works at Kingman during the past few days from the American Flag mine, Wallapai mountains. Messrs. Richards, Corin & Co. are the fortunate possessors of one of the best paying mines in the Territory of Arizona. J. H. Johnson, who has lately made a sale of the C. O. D. mine to Messrs. Howell & Dana, had 18 tons of ore worked at the Kingman sampling works last Wednesday, and has about 45 tons yet to work. This ore was already on the dump at the time the mine was sold, and was not included in the trade. These 63 tons of ore will net Messrs. Johnson & Clark something in the neighborhood of \$5000. Rees Jones has a carload of ore ready to ship from the Rocky Point mine, the result of his own work for the past six weeks.

#### COLORADO.

**TABOR.**—Georgetown Courier, Nov. 26: E. Beaudry & Co., lessees, have been meeting with highly satisfactory results in their work upon this property. In the stope above the 100-foot level west, which is 65 feet long and about 30 feet high,

they have had a continuous body of ore, and as they raise it, it has been found to increase in quantity and quality. The ore body is now from 8 to 10 inches in thickness and extends the entire length of the stope. The ore has been sorted into two classes, the first of which has been milling about 112 ozs. silver per ton and 42 per cent lead. About 30 tons of ore is ready for shipment which they think will run some better. The bottom of the east drift shows 16 inches of solid galena, and an equal body is shown in the bottom of the west drift. The heading of the west drift is in scattered mineral. The extension of this drift will be commenced next week, and pushed to the junction of the Tabor and Gov. Thomas lodes—a distance of 75 or 80 feet. Considerable high-grade ore was taken out of the surface workings at the junction of these veins, and the lessees are confident of finding a good body of ore ahead of them. Mr. Beaudry is one of the owners of the Tabor, and under his supervision the property is being worked to its best advantage and with a view to its future welfare.

**CENTENNIAL.**—A contract has been let to sink the shaft an additional 50 feet. Eighteen inches of pyritous ore was encountered soon after commencing work, and on the first of this week it had increased to a width of nearly three feet.

**RED ELEPHANT.**—The Swartz shaft on the Red Elephant has been surveyed with the view of straightening it. It is probable that the work will be commenced soon.

**SILVER CACHE.**—Supplies are being laid in to work this property all winter. "Sailor" Evans expects to have a big showing by next summer, as well as a big lot of ore to mill.

**WHEELING.**—Mr. E. Moore has laid in supplies on this snow-bound property to work it all winter.

**FOUR-THIRTY.**—Charley Veatch expects to work the property all winter.

#### IDAHO.

**THE GOLD BELT.**—Wood River Times, Nov. 24: The development of the Gold Belt will naturally cause inquiry into the best methods of reduction, as the mills there have heretofore simply been reducing the ores for what gold they could catch, allowing the larger and better part of the precious metals to run to the tailings reservoir. But this wasteful system will soon have to be abandoned for a more satisfactory one that will work the ores up to the 95 per cent which is common now, in old mining districts. What that system or process will be—whether chlorination, or lixiviation, or what, remains to be determined by actual and exhaustive experiments; but certain it is that the owners of mines on the Gold Belt can no longer be satisfied with the low percentage heretofore obtained. If a really first-class mill is ever built to reduce Gold Belt ores, it will make such a record that the public will be astonished and wonder how so much wealth has been permitted to lie dormant so long. Then will come a genuine and lasting boom, for Hailey and the Gold Belt.

**GOLD HILL.**—Ketchum Bulletin, Nov. 24: The Gold Hill mine, at Quartzburg, Boise county, Idaho, has been sold to San Francisco parties for \$150,000. The purchasing parties also pay for all supplies on hand and the expenses on the new mill since the fire, which will probably be \$30,000 more. Sam Allen says the Parker Mining Co. has expended \$75,000 in prospecting its property since the pay ore has been exhausted in the Parker mine. A small crew of men is still kept prospecting in the Western Reserve mine, adjoining the Parker. Mr. Allen says they intend to find it, if there is any more ore in the mountain. Messrs. Stone and Rineheart are now employed at the Mattie mine, on the head of Trail creek. Mr. Stone came down to town Monday. He informs us that the mine is looking finely, with plenty of good ore in sight. Fifty sacks of high-grade ore is now ready for shipment and will be brought down this week. Ore is being taken out every day. This property is turning out a good one. It belongs to the Fall City Mining Company, J. B. Rieff, superintendent.

**FLINT.**—Idaho Avalanche, Nov. 27: We learn from a gentleman in from Flint that the mines being worked by the company at that place never looked better than at present. Supt. Stanton feels from the present appearances of the ore bodies that the company has a bonanza in the Perseverance, Sherman, Star of the Evening and the Rising Sun. Work is now being prosecuted on all the lodes named. The drift being run to connect with the bottom of the Perseverance shaft is nearly completed, and is in very rich ore, as is also the north drift from the bottom of the shaft. The ore exceeds all expectations, being worth about \$1500 per ton. In the Star of the Evening, the ore body is steadily growing richer as the drift is extended into the hill, while rich ore has been struck in the Sherman and Rising Sun. The crosscut from the Perseverance to the Rising Star is being run as fast as possible, and before a great while the last named will be reached and opened. Mr. Stanton feels jubilant over the outlook.

#### MONTANA.

**THE ANACONDA SMELTER.**—New Northwest, Nov. 26: The Anaconda Smelting Works started up a number of their matting furnaces on Monday with over 100 men working. The number was increased by Tuesday morning to the firing of the entire 26 matting furnaces and the employment of over 200 men, with applications from fully 50 more men wanting employment. Trains of ore and coal are arriving, the steam stamp is crushing 300 tons of ore a day, the calcine furnaces are now being fired, and it is anticipated the concentrators, which will put all the old works in motion, will be started up in a day or two. The company has adhered to the scale of prices offered, and a large majority of the workmen remaining in Anaconda have decided to go to work at the reduced rates rather than remain idle or depend upon the contributions of others. Sheriff McMaster has been in Anaconda this week and says quiet prevails. Some 60 or 70 special deputies and watchman have been sworn in as a precautionary measure, but there has been no occasion manifest for their services. We learn from other sources that there are about the same number of men in Anaconda who will not be reconciled to accepting the rates offered, and hold frequent meetings to discuss the matter, but have made no demonstrations to interfere with others who are at work or seeking it.

We learn also that the foreman of the Anaconda mine, Batte, has been instructed to hold himself in readiness to put out 1000 tons of ore per day, and that the Dilon quarries are to furnish more rock for the new concentrator. It seems probable that the works will be started up to full capacity as rapidly as possible and the money paid out will greatly relieve the situation at Anaconda. The workmen there have doubtless chosen wisely in taking a reduced rate of wages, for the winter at least, in preference to idleness or want, or perhaps both. The Anaconda matter in several points is a special case and is not a precedent for establishing rates elsewhere.

**THE BALD BUTTE GROUP.**—What is known as the Bald Butte group of mines in the main range, west of Marysville, has been bonded to an English concern, somewhat allied to the Montana and Empire companies. The principal mines of the group are the Sterling and Albion, and these are being now developed under the bond. What is known as the Sterling Gold Mining Co., has been formed to purchase and operate the property, and is capitalized at £100,000 in shares of £1 each. It is stated that the purchase price of the property is £38,000 in cash and £27,000 in paid-up stock of the company. The principal owners of the property are understood to be B. H. Tatem, Wm. Chumaseiro and the Chadwick estate.

#### OREGON.

**DIGGINGS.**—Jacksonville Times, Nov. 27: J. Klippel & Co., who have excellent diggings on Applegate, commenced mining last week. The miners feel encouraged and many of them expect a wet winter, as considerable snow already lies in the mountains. Haskins, Long & Co., who will operate the Star Gulch claim this season, have everything in readiness and in better shape than ever. John O'Brien has been making much preparation at his mines in the Steamboat district and will soon be ready for active operations. F. A. Davis, of Grave creek, will mine on a more extensive scale than ever this season. He has first-class diggings and will no doubt do well. Operations have commenced at some of the hydraulic claims in Josephine county, where mining operations will be more extensive this season than for many past. Brown & Co.'s mill, at the Swinden ledge, is running on full time and crushing several tons of quartz daily. There is an abundance of quartz on the dump and in sight. The weather of the past week has been more favorable for the miners, and the ground is becoming so well soaked that it will not take much more rain to start many of the placer mines. Another cleanup was made at Klippel, Baume & Co.'s mill during the past few days, which resulted quite favorably. Quartz from the claim of McKenzie & Co. is being crushed, which is turning out well.

**BAKER CITY ITEMS.**—Cor. Bedrock Democrat, Nov. 27: The mines are attracting attention; mining men are coming here from Colorado, New York City, San Francisco and other places with money in their hands and stop off with the view of spending a month or two looking over the country and purchasing mining property. Mr. H. Hill, of Leadville, Colorado, is here with the view of building concentrating works and sampling and buying ores. He will spend a month looking up the business. Col. W. M. Wilson, of Montana, is looking after a gold mine—wants to purchase an improved property. Another gentleman from New York is also looking after mining property. We have talked with these gentlemen and are satisfied they mean business. The Virtue mine, eight miles east of here, has been pumped out and will start up the mill and commence crushing ore in a week. The Connor creek mine is running 35 stamps and produces 150 pounds of gold a month. We are told that there are four quartz mills on the road to Canyon City that are producing large amounts of gold and paying handsome dividends. The placer mines have had a dry season, but they are scattered over a large area of country and have yielded handsomely. The Chicken Creek and several other mines on Burnt river, and the mines in Rye valley and on Upper Burnt river, have all yielded satisfactory results.

#### UTAH.

**MINING REVIEW.**—Salt Lake Tribune, Nov. 26: The week has been a dull one in mining circles, heavy storms having prevented the free handling of the metals. The especially noteworthy feature of the week has been the purchase by Salt Lake parties of the Camas No. 1 and the Fraction on the Wood River (Idaho) gold belt for some \$45,000. They will be incorporated. The receipts of ore for the week ending the 24th inclusive were the lightest for many weeks, being \$23,373.50; of bullion for the same time, \$105,867.38, a total of \$129,240.88. For the previous week the receipts were \$88,491.44 of ore and \$74,873.31 of bullion, a total of \$163,364.75. The output of the Ontario mine for the week was 26 bars of bullion, 15,958.11 fine ounces; and \$8745.49 ore sales; a total of \$24,704.60. The daily product for the week was six bars of fine bullion \$8535.84; no ore sales. Fine bar receipts for the week were \$27,764.81; base bullion, \$13,300. The product of the Hanauer smelter for the week was \$24,250 in bullion. Ore receipts here for the week were \$8800 by Wells, Fargo & Co.; \$9465 by McCormick & Co.; \$5108.50 by T. R. Jones & Co.

#### NEW MEXICO.

**IN BETTER SHAPE.**—Rio Grande Republican, Nov. 28: We are glad to note that the Stephenson mine is now in better shape than it has been for the past few years, as far as title is concerned. A four years' lease on the property has been made by H. Lesinsky, General R. B. Marcy and C. F. Sturtevant, comprising a majority of the stockholders, to Dougher & Bennett, and they, in connection with Foy Bros. & Baren, are equally interested in working it, each owning a one-fifth interest. Fifty per cent of the net proceeds are paid to the stockholders. S. M. Ashenfelter has also a lease on record agreeing to terms. This is the most promising property now developed in the Organ mountains, and in connection with the Bennett and adjoining property, it is thought by interested parties that a sale to capitalists, who will work the mine thoroughly, can be easily consummated.

## LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning  
and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.  
In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

114-118 Pine Street, - San Francisco

We would call the attention of Assayers, Chemists,  
Mining Companies, Milling Companies, Prospectors, etc.,  
to our full stock of Balances, Furnaces, Muffles, Crucibles,  
Scorifiers, etc., including, also, a full stock of  
Chemicals.

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast, we feel  
confident from our experience we can well suit the de-  
mand for these goods, both as to quality and price. Our  
New Illustrated Catalogue, with prices, will be sent on  
application.

Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application. Agents for the Patent  
Plumbago Crucible Co., London, England. Also for E.  
G. DENNISTON'S Silver Plated Amalgam Plates. The  
plates of this well-known manufacturer are thoroughly  
reliable, and full weight of Silver guaranteed. Orders  
taken at his lowest prices.

JOHN TAYLOR & CO.

## Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager.

ESTABLISHED 1869

Ores worked by any Process.  
Ores Sampled.  
Assaying in all its Branches.  
Analyses of Ores, Minerals, Waters, etc.  
Working Tests (practical) Made.  
Plans and Specifications furnished for the  
most suitable Process for Working Ores.  
Special attention paid to Examinations of  
Mines; Plans and Reports furnished.  
O. A. LUCKHARDT & CO.,  
(Formerly Huhn & Luckhardt,)  
Mining Engineers and Metallurgists.

J. KUSTEL. H. KUSTEL.  
**METALLURGICAL WORKS,**  
318 Pine St. (Basement),  
Corner of Leidesdorff Street, - SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my  
Process.  
Assaying and Analysis of Ores, Minerals and Waters.  
Mines Examined and Reported on.  
Practical Instruction given Treating Ores by im-  
proved processes.

G. KUSTEL & CO.,  
Mining Engineers and Metallurgists.

C. H. AARON,

**ASSAYER AND METALLURGIST,**  
NOGALES, ARIZONA,

Will attend to business in connection with mines in So-  
nora or Arizona.

WM. D. JOHNSTON,

**ASSAYER AND ANALYTICAL CHEMIST.**  
514 Kearny Street,  
SAN FRANCISCO, CALIFORNIA  
ASSAYING TAUGHT.

Personal attention insures Correct Returns.

This paper is printed with Ink Manufactured  
by Charles Eneu Johnson & Co., 500  
South 10th St., Philadelphia. Branch Offi-  
ces—47 Rose St., New York, and 40 La Salle  
St., Chicago. Agent for the Pacific Coast—  
Joseph H. Dorey, 529 Commercial St., S. F.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and  
high heads are utilized, and are guaranteed to give more power with less water than  
any other wheel made. Being placed on horizontal shaft, the power is transmitted  
direct to shafting by belts, dispensing with gearing.  
Estimates furnished on application for wheels specially built and adapted in  
capacity to suit any particular case.  
Further information can be obtained of this form of construction, as well as the  
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,  
by applying to the manufacturers.

JAMES LEFFEL & CO.,

Springfield, Ohio,

or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents,  
Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

## CALIFORNIA HAND ROCK DRILL,

—FOR—  
**TUNNELING, DRIFTING,  
and SINKING.**

Buy the best and latest improved  
Hand Rock Drill; can be run by hand-  
steam, compressed air, or water power.  
Machine made entirely of crucible  
steel; light, compact and durable.  
Strikes 250 blows per minute with 7-lb-  
hammer. A perfect reproduction of  
hand drilling; will drill one inch per  
minute in the hardest rock, using  
one-quarter the number of drills  
equired by hand labor.

Machines on exhibi-  
on at No. 32  
First St., San  
Francisco.

Send for  
circulars.

GEO. T. EMERY, General Agent.

## PELTON'S WATER WHEEL.

THIS WAS ONE OF THE FOUR WHEELS TESTED  
by the Idaho Company at Grass Valley, Cal., and  
gave 90 2 per cent., distancing all competitors. Send for  
Circulars and guaranteed estimates.

L. A. PELTON,  
Nevada City, Nevada Co., Cal.

AGENTS—PARKE & LACY, 21 and 23 Fremont Street  
San Francisco, Cal.

**Engraving**—Superior Wood and Metal Engrav-  
ing, Electrotyping and Stereotyping  
done at the office of this paper.

## THE CONSUMERS' COMPANY.

## VULCAN B B AND AJAX.

The Best LOW GRADE EXPLOSIVES in the Market.

SUPERIOR TO BLACK OR JUDSON POWDER.

**Vulcan Nos. 1, 2 and 3,**

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank  
Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

**VULCAN POWDER CO.**

218 California Street, San Francisco, Cal.

## THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

**GIANT POWDER or DYNAMITE,**  
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE, which contains 94 per cent of Nitro-Glycerine, and  
GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

**JUDSON POWDER IMPROVED.**

FOR RAILROADS and LAND CLEARING. Is from three to four times stronger than ordinary Blast-  
ing Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and  
saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

**BANDMANN, NIELSEN & CO.,**

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO, CAL.

## THOMAS PRICE'S ASSAY OFFICE,

CHEMICAL LABORATORY,

**BULLION ROOMS and ORE FLOORS,**

524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed  
of in the Open Market to the Highest Bidder.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING NOVEMBER 23, 1886.

- 353,118.—CAR COUPLING—J. J. Bogard, Tehama, Cal.  
 353,050.—LAWN TENNIS NET POLE—Emilie G. Booth, Berkeley, Cal.  
 353,211.—PISTON PACKING—J. W. Dudley, Portland, Ogn.  
 353,133.—PATIENT'S ELEVATOR AND PERAMBULATOR—Margaret Hammond, Port Madison, W. T.  
 352,920.—SULKY GANG PLOW—J. W. Holland, Pomeroy, W. T.  
 353,073.—WASHING MACHINE—Jos. La River, Hayward, Cal.  
 353,079.—HARROW—J. G. Owen, Covello, W. T.  
 353,083.—DISCHARGING CARGOES—James Reid, Portland, Ogn.  
 353,160.—CAN TOP AND COVER—F. A. Robbins, S. F.  
 352,936.—PLOW—J. T. Senteney, Blocksburg, Cal.  
 352,985.—PROPULSION OF CARS BY COMPRESSED AIR—Jas. M. Thompson, S. F.  
 353,187.—GAS BURNER—J. S. Wethered, S. F.  
 353,043.—MANTEL GRATE—E. W. Williams, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Mining Share Market.

There has been no such "boom" in mining shares for years as is now being experienced here. Prices have advanced very rapidly, all varieties following Con. California and Virginia, which is the leading stock. In this mine the Comstock papers say the new ore development not only holds good, but, in fact, shows considerable improvement in size as well as quality with further development. The shipment, Nov. 27, of 25 bars of bullion, weighing a ton and a half and valued at \$100,000, was a reminder of old bonanza days. Ophir and Best and Belcher have both advanced materially on account of their nearness to the leading mine, though they do not pretend to have found anything new. Thus far, as the rise in prices has been continuous and steady, most all dealers have made money; it will only be when the first drop comes that there will be sufferers. Even if Con. California and Virginia keep in the good ore they are said to have, this is no reason that a lot of other mines, without ore, should be worth the advanced prices now quoted. It is useless, of course, to warn poor people to keep out of stocks, the dealing in which should be left to persons of financial standing, to whom a loss of a few hundreds or thousands will be no great matter.

Since writing the above the first "set-back" has occurred, owing to the failure of a Virginia City firm of brokers. Other failures followed; and on Thursday there was a panic in the market.

The Virginia Enterprise says: All sorts of rumors are prevalent as to the developments in the leading mines, and matters connected with the mining situation generally, most of them erroneous and deceiving. Therefore, all should be on their guard and not believe everything they hear.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Moulton, Nov. 24, \$12,792; Alice, 24, \$32,720; Con. California and Virginia, 25, \$101,623; Barbers, 24, \$14,861; Hanauer, 25, \$4,150; Bannock, 25, \$18,000; for November, \$30,000. Hanauer, 27, \$6650; Stormont, 27, \$28,410; Alice, 24, \$11,223. The banks of Salt Lake City report the receipt for the week ending November 24th, inclusive, of \$105,867.38 in bullion, and \$23,373.50 in ore, an aggregate of \$129,240.88.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

Heath M. Co., Dec. 1. Location, Idaho Territory. Capital stock, \$100,000, in \$100 shares. Directors—Thomas Bell, E. B. Pond, W. L. Oliver, L. P. Drexler and S. Linkton.

Baltimore S. M. Co., Dec. 1. Location, Storey county, Nevada. Capital stock, \$10,500,000. Directors—John H. Dickinson, E. Strother, George Childs, John F. Taylor and C. A. Sankey.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

## MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

## New York Metal Market.

Telegraphic advices dated Dec. 2d give the following New York prices:

BORAX—5 1/2 @ 6 1/2 c.  
 BAR SILVER—98 1/2 per oz.  
 COPPER—LAKE—\$12.00 @ \$12.50  
 IRON—No. 1, \$18.50 @ \$19.50.  
 LEAD—\$4.85 @ \$4.95.  
 QUICKSILVER—53 1/2 @ 55c.  
 The following is the latest by mail from the "New York Metal Exchange Market Report":  
 COPPER—Firm, spot closing @ \$12.00 @ \$12.15.  
 Transferable Notices (Lake) issued at \$12.05.  
 Transferable Notices (Chili Bars) issued at \$12.15.  
 LEAD—Quiet at \$4.20 @ \$4.30c spot. Transferable Notices issued at \$4.42 1/2.  
 TIN—Dull at \$22.45 @ \$22.60. Transferable Notices issued at \$22.75.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers and sellers views. All prompt delivery.—Australian Tin, \$22.50 @ \$22.80; Billiton Tin, \$22.75 @ \$23.10; Banca Tin, \$23.00 @ \$23.50; Baltimore Copper, \$10.35 @ \$10.95; Orford Copper, \$10.50 @ \$11.00; P. S. C. Copper, \$10.25 @ \$11.00; Foreign Lead, \$4.35 @ \$4.70; Foreign Spelter, \$4.35 @ \$4.75.  
 MAKER'S PRICES—At tidewater, 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$18.50 @ \$19.50; No. 2, \$17.50 @ \$18.50; Grey Forge, \$16.00 @ \$16.50. Hudson River, Grade No. 1, \$18 @ \$19.50; No. 2, \$17.50 @ \$18.00; Grey Forge \$15.50 @ \$16.50. Southern, Grade No. 1, \$18.00 @ \$19.00; No. 2, \$17.00 @ \$18.00; Grey Forge \$15 @ \$16.

## A CHANCE TO INVEST.

## THE FRISBEE-LUCOP MILL,

## A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied. At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

# \$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR**  
OR VANNING MACHINE.

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS**  
(\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

# \$1,000 CHALLENGE ACCEPTED,

## PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE "TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

**JOSHUA HENDY MACHINE WORKS,**  
Nos. 39 to 51 Fremont St., San Francisco, Cal.

## THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

## THE ORIGINAL Roller Ore Feeder

This form of Ore Feeder is well adapted for its peculiar work.

In reference to a similar form of "Roller" Feeder, which is being manufactured and offered for sale in this city, and of which a cut appears in this journal, we have to say that the Superintendent of the Bunker Hill Gold Mining Company states that the "Challenge" is far superior to the "Roller," he having had both of them operating side by side. We shall be pleased to show this letter, upon application, to any one interested.

We are also manufacturers of the "Challenge" and "Stanford Improved."

Prices furnished by the

**JOSHUA HENDY MACHINE WORKS,**  
39 to 51 Fremont St., San Francisco.

## ORE FEEDERS.

We direct attention to an advertisement, which appears in our journal of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder, known as the "Templeton Roller," claim that it is superior to any other style, and cite those in operation at the "Bunker Hill" mill in Amador county, we expressly contradict the statement, and in substantiation submit a copy of a letter shown to us by a representative of the "Joshua Hendy Machine Works," which speaks for itself

BUNKER HILL GOLD MINING CO.,

AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ores to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will sluice right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly,

(Signed) N. W. CROCKER, Supt.

**RANKIN, BRAYTON & CO.,**  
...BUILDERS OF...  
**MINING MACHINERY.**

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

### WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

### BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE OF CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

## IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

**BEST SOFT LAKE SUPERIOR COPPER USED.**

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.**

**E. G. DENNISTON, Proprietor.**

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

## The Clifton Copper District.

The Clifton district, on Copper mountain, discovered in 1865, has been the scene of continuous operations since 1876, and is not only the oldest copper-mining district in Arizona but also the largest producer in the Southwest. It lies within an almost circular range of mountains, forming a large basin, some 10 miles in length north and south, and six or seven miles in width in an easterly and westerly course. The sketch map on this page gives an approximate idea of its topography. It is from a drawing accompanying the descriptive paper read before the American Institute of Mining Engineers by Arthur F. Wendt.

The basin is found between Eagle creek on the west and the San Francisco river on the east, and there is only one practicable outlet from it, namely, by Chase creek, which drains the whole basin and cuts through the range, separating the basin from the San Francisco river. At the junction of Chase creek and San Francisco canyon is the town of Clifton, which is connected by the Arizona & New Mexico Railway, a narrow-gauge line about 70 miles long, with the Southern Pacific Railway at Lordsburg.

The San Francisco river is a rapid stream, which carries a large volume of water the year round, but Chase creek runs dry in autumn. The water of the creek is heavily charged with copper, so that it is unfit for drinking purposes, except during the rainy season and while the snows on the mountains are melting. The geology of the district, although much disturbed in details, is, on the whole, simple. The center of the basin is a vast mass of porphyry. Leaving the center of the basin in almost any direction, the crests of the mountains surrounding the district are formed of stratified limestone. Where the limestone is wanting in the circular range, granite fills the gap. The beds of limestone are, in every instance, horizontal, and lie conformably on beds of sandstone. Both seem to abut unconformably against the granite. This granite seems to be eruptive, and the presence of large dykes of felsite cutting vertically through the bedded lime and sandstone gives additional weight to this view. The porphyry is undoubtedly of more recent age than the granite; for, in the Coronado mines, the porphyry which here assumes the character of a true quartz porphyry cuts the granite as a huge dyke some 10,000 feet long

and as much as 300 feet in width. Near the center of the district the porphyry incloses large masses of limestone, which stand like islands in a sea of porphyry.

Following Chase creek canyon from its origin in the basin easterly toward its junction with the San Francisco river, we first find ourselves in the rugged hills of porphyry of the basin. Opposite the Longfellow mines we strike the inclosing range of mountains, and the lime and sandstones. The canyon here is eroded on the contact of the porphyry and the stratified

trachyte took place, while their age is limited on the other hand by the fact of their being found both in the sedimentary limestone and in the eruptive porphyry and in granite.

The mines of Clifton district are readily divided into three groups. First, those occurring in limestone; second, those occurring in porphyry; and third, those occurring in granite. The ores of the first system of veins are oxides, primarily the red oxide or cuprite in a gangue of compact hematite and malachite and azurite in a gangue of manganese ore

lowed into the hill by a horizontal tunnel, and led to the discovery of two parallel veins of ore striking approximately northeast and southwest, and dipping at an angle of about 80° or 85° to the southeast—that is, with the slope of the hill. Fig. 2 illustrates these conditions.

At and below the level of the upper Longfellow tunnel the two veins carry an iron ore containing red oxide of copper and but little carbonate of copper. On the dip of the veins from this level only such ores are found until the veins approach the underlying sandstones.

Native copper there occurs sparingly, and the veins become pinched and finally barren. They have not been followed into the sandstone, and it is quite problematical whether they have any value in that rock.

It will be seen by Fig. 2 that the Longfellow mine is an almost vertical fissure in stratified limestone, at or near the junction with a dyke of felsite. In places the vein or branches of it are at the contact of the limestone and felsite, there forming a true contact vein. Again, branches of the vein are entirely in felsite, and others entirely in limestone. We see an illustration in this mine of the general conditions of veins of ore in stratified limestone so well described by various writers as occurring in the lead veins worked on the mountain limestone of England.

We find true "flats" or bodies of ore branching from the main fissure, and practically replacing one or more beds of limestone. Again, we find other masses of ore that leave the main fissure and follow the vertical seams in the bedded limestone. More generally, the ore occurring entirely in the limestone assumes irregular shapes, as if it had fill-

ed an irregular cavity. Hence, many engineers and miners have called the Longfellow mine a "deposit" or "pocket." Indeed, the same opinion has been expressed by different geologists of all the other large copper mines of the southwestern districts. It is, however, says Mr. Wendt, erroneous. With only two exceptions of minor importance, all of the large copper mines of the southwest are true fissure veins in the sense that they are bodies or masses of ore deposited in the rocks which now contain them, subsequent to the deposition or formation of these rocks. The fact of profitable veins occurring in limestone and presenting all the usual irregularities of veins found in this rock cannot blind the careful observer; for no other theory than that of an intrusive origin will explain all the phenomena of the occurrence of these ores.

Fig. 1.—SKETCH MAP OF CLIFTON MINING DISTRICT, ARIZONA.

rocks, the porphyry forming the northern walls of the canyon and the lime and sandstones the southern. Fig. 2, on page 377, is a section across the canyon at this point.

Continuing down the canyon we reach the granites, and, approaching the town of Clifton, modern trachytes.

Crossing the San Francisco river, and continuing our journey still further east, we find a range of hills and mountains of quite recent volcanic origin. Further south and toward the Gila river, a distance of some 15 miles, a very recent conglomerate is found, in which round boulders of this lava, the trachyte of the town of Clifton, and round boulders from the copper mines, form component parts. The mines must, therefore, have been in existence before the eruption of the lava and the older

or wad. The ores of the second and third systems are oxides and oxysulphides on the surface, changing into copper glance at a trifling depth, and into yellow sulphurets in the deepest workings. While the extent and number of the veins of the second and third class is considerably larger than that of the first class, these latter are, by far, the most valuable and productive, and are the ones which first gave prominence to the Clifton mines.

The principal mine in the district is the well-known Longfellow, now owned by the Arizona Copper Company. The first discoveries made on the Longfellow were some small seams and pockets of ore cropping out near the crest of the Longfellow hill in a decomposed shaly limestone largely altered into clay. These small strings, veinlets and bunches were fol-

We admit, unindorsed, opinions of correspondents.—Eds.

## The Drumlummon.

## A Famous Paying Mine in Montana.

[From our Traveling Correspondent, R. G. HUSTON.]

In a former letter written when here one year ago, I gave your readers a sketch of this locality, but perhaps it would be well to again give it in detail. This mine is 22 miles northwest of Helena, in Lewis and Clarke counties, Montana, on the headwaters of Silver creek. The placer mines on the lower portion of this creek were among the first discovered in the Territory.

This mine was discovered and partially developed by Thos. Cruse, and some years ago a sale was effected to some English capitalists, who immediately incorporated and capitalized it with 330,000 shares, at \$10 per share, under the name of the Montana Company, Limited. They at once commenced to systematically develop the mine and to place thereon a plant of the proper capacity to work it up to a dividend-paying basis. The first management was not fully up to the requirements of the situation, but a 50-stamp mill with all the modern improvements was built in addition to the old 10-stamp mill bought with the property, this giving them an equipment of 60 stamps. The Maskelyne tunnel tapped the lead at a favorable point near to one of the best ore chutes in the mine. Still, under the first administration, they were unable to bring their product to a higher figure than \$28,000 or \$30,000 per month. The natural result of this was to depress the value of the shares, and down they went to about \$2.50. Two years ago, on the 1st of December, R. T. Bayliss was placed at the head, with H. Bratnober as mine superintendent, and since that time the product and price of shares has been greatly increased. Shares are now quoted in the London market at \$47.50, and this extraordinary advance in values will not be surprising when we find that nearly \$330,000 was disbursed in dividends on the 15th of January and 15th of July. This, with a continual increase in monthly product and continual permanent improvement going on around the mine and works.

## The New 60-Stamp Mill.

The new 60-stamp mill, now about completed, was constructed under the careful and efficient superintendency of Thomas W. Fisher, who has had charge of the construction of several of the finest mining plants built in Montana. The 60-stamp silver mill at Gloster and the Algonquin 20-stamp mill at Phillipsburgh are standing evidence of his ability in this direction, and the fact that he had a carte blanche to order whatever he needed will be proof enough that the mill is complete from top to bottom.

The dimensions are 160 feet frontage by 112 feet in depth, and from basement to the ore-house roof 100 feet.

The carway from the mouth of the Maskelyne tunnel being on a level with this, the rails are run in over an elevator tramway, and the mules used to bring out the ore trains take them right in over the ore bins, when the first drop is made. These bins have a capacity of 2000 tons, and are built with a view to convenience and economy. As the stamps are subdivided into three 20 stamp sections, the bins are so arranged that different classes of ore may be handled in each section if it is desired. From the bins the ore runs down over grizzlies to the rock-breakers, of which there are three of Blake's latest-improved 15x9 crushers, and their capacity for chewing up ore is simply immense.

From here the ore is dropped into 12 of Hendy's automatic Challenge feeders, and from them the 60 stamps of 750 pounds each are kept in provender. These, moving at the rate of 95 drops per minute, will pulverize a mountain of ore in a short time. They are secured in place by Fargo patent stamp guide, which enables them to hang up and unshin any one of the stamps without interfering with or stopping any of the others, making a convenient improvement over the old way.

## The Concentrating Room.

From the batteries the pulp passes over silver-plated amalgamating plates, and as it is a gold mill, from there it is dropped to the vanning-room for concentration. This room is 110x42 feet in dimensions, and contains 24 Frue vanners, or two to each 5 stamps. This company, about one year ago, gave the Frue and Triumph vanners an impartial trial, the result of which was that they chose the Frue. In consequence, they at once put in 24 of them in the two mills then running, and, of course, when the new plant was placed it was also equipped with the same pattern, making 44 Frue vanners this company is now operating.

## The Power to Operate

The whole concern is furnished by a compound Corliss engine of 150-horse power. The high pressure cylinder is 14x42; the low pressure is 24x42, and the heaters, air-pump and condenser are in the basement below, thus leaving the engine-room in tidy shape. The manager is so well pleased with the general appearance of it that he has ordered a carpet for it—a rather snug corner for a couple of engineers to winter in, I should say, and made me almost wish I was an engineer. The steam is fur-

nished by two standard size boilers, 16 feet long by 42 inches in diameter. The foundation they were compelled to blast out of solid granite in order to place it up to the side of the mountain to get the full benefit of the continuous drop from one department to the other. The whole mill is lighted by a 60-light incandescent Weston dynamo, and it is a perfect success both as to light and economy, being liked very much better than the arc system and costing much less.

The fireman has not been forgotten, either, as they have a car track placed right in front of his furnace and he has no difficulty in getting his material on hand for use.

The aim in building this plant from top to bottom has been to reduce the general expense of milling their ore, as they have an abundance of a low grade, and to make it work to a profit as well as to get the concentrates. It is my impression that it will be a grand success, as the main advisers and promoters are careful, conservative men, and have, no doubt, closely investigated the proposition. The new mill was

## Formally Set to Work

On the 17th of November, Mrs. R. T. Bayliss doing the honors by turning on the steam for the first time, setting the ponderous machine to work, at first only dropping 20 stamps, and a few hours afterward 20 more, and this morning, the 18th, the other 20 were set to work to be continued indefinitely. Everything moved off smoothly without a jar or stoppage, not even a belt breaking or getting loose. These are all arranged with patent tighteners, enabling a man to tighten them without danger to himself or inconvenience.

All the lumber consumed in building was shipped in from Oregon. The sides are all double boarded and lined with heavy building paper, and it is heated by 16 radiators, which will no doubt keep the atmosphere at the right temperature during the winter months.

They expect to operate it with five men to each shift, exclusive of the engineer and fireman, and if they succeed it will be a very cheaply operated mill of that size—the most economical in point of labor that I have seen. Frazer & Chalmers were the designers, and from their works everything was placed. The other mill and the large air compressor were built by the Union Iron Works of San Francisco; and although nearly all were unanimous in the idea that the Drumlummon would never have use for a compressor of such a large capacity, it is now found to be none too large to meet the present requirements. Thus what at one time seemed almost an elephant is now really a boon to the company.

## The Engine Running the 50-Stamp Silver Mill

Is certainly a phenomenon, as it has been running some two years and eight months and the total repair expense is less than \$10. The work done by it is immense, running the two rock-breakers and 50 stamps and other machinery. After the pulp passes over the plates it is elevated to the vanner-room and concentrated before amalgamation, as the management discovered by experimenting that they obtained much better results in that way. Then it is run down to the pans, settlers and agitators. All of these are driven by this engine, and for the length of time run and the amount of work done it is certainly unprecedented for neatness and durability. It is one of the best here.

The old 10-stamp mill is still in service and doing satisfactory work, probably more so than when Mr. Cruse first started it up on the mine years ago. The whole development is a fair illustration of the old maxim that "great oaks from little acorns grow." The manager's residence is located a short distance above the old mill, next to those of the superintendent and assistants (the company physician next door), making the offices of the company as convenient as possible, so that at any time they may be called for on short notice.

## The Mine

Is still under the practical and skillful management of my old friend, H. Bratnober, and to his constant and unremitting attention to details the continued prosperity of the Montana Co. (Limited) is largely due. Early and late he may be found in the line of his duties, ever on the alert to observe and take any advantage of the work that opportunity may offer to further the interest of the company. His many years' experience in the handling of men and mines is proving a handsome capital for him. He will experience no difficulty in keeping the 120 stamps dropping on ore that will net the owners handsome results for a long time to come.

The Maskelyne tunnel is their principal opening. This was driven into the mountain over 1200 feet before it tapped the lead at a depth of 400 feet from the surface, and nearly all the ore that has been milled up to date has been taken from this tunnel. From it levels have been driven north and south to a distance of 1400 feet.

The vein being a contact one, it was comparatively easy to follow. It is very irregular in size, ranging from 8 feet to 35 and 40 in width, the rich ore lying in chutes [as was shown by the diagram given in the MINING AND SCIENTIFIC PRESS of Nov. 27, 1886.—Eds. PRESS]. From the superintendent's report of June 30, 1886, I extract the following figures: High-grade \$20 and upward, 71,817 tons; low-grade under 20 and good enough to mill, 113,567 tons. This is exclusive of anything below the 400-foot level, or the Maskelyne tunnel.

Since that time he has started a large three-compartment shaft, and at the 100-foot level cut out a station and started levels, and then continued sinking.

They are about ready to commence cutting out the 200-foot station, and the general appearance is much the same as at the 400-foot level, giving them now an apparent reserve of 200 feet of solid ore body. The intention is to run the shaft down and cut out stations every 100 feet to 500, and they will undoubtedly be then satisfied with their development for the time. I also extract from the statement of accounts for the half year ending June 30, 1886, the gross product of the mine, which aggregated nearly \$700,500. The total expenditure was \$260,840, leaving a balance of \$439,660, to be passed to net revenue account. This is a healthy showing and cannot fail to please the shareholders. This is one mine that I can safely recommend as

## Run Wholly on its Merits

As a mine. There is no small pecuniary speculation of the management to obtain a profit out of each man's earnings.

Every man who has any business transaction with the company whatever is paid in the coin of the realm, and there are no company stores or company boarding-houses to which they are given orders, or given their choice to either pay tribute to the company or not have employment. Every employee of the Drumlummon is a free agent and allowed to transact his own business to suit his own sweet will. They pay the full measure of wages going in the country, and all they exact in return is a good honest day's work.

This consistent course toward their employees will enable them to snap their fingers in the face of any labor organization on the continent with impunity. The safety of their men is another special study with them, and until the past week they have not had an accident for two years, and then two followed each other in close succession. In neither case could the management have done anything to prevent. The first one occurred by the man entering the drift too soon after a blast had been put off, and a large piece fell on him and broke his back. The second, a man tried to take some planks up into the shaft without making them fast to the cable, and they caught under the timbers, threw him down, and he paid the forfeit with his life. Two others were hurt, but not seriously. There is now a meeting called by Mr. Bayliss, of the men, for the purpose of

## Organizing a System of Insurance

For the benefit of the men. The assessment system will probably be the one adopted, as that is now the popular mode. The proposition laid before the men is about as follows: To be of the number employed by the company is, of course, compulsory, and a regular contribution is to be deducted from each employee's pay at the end of each month; the company to pay into this sinking fund a sum equal to half of the men's own contributions, thus making one of the most liberal propositions I have ever known a company to make its force. From this sum a weekly indemnity will be paid each injured man during his disability; and if death ensues, a stipulated amount is to be paid to the relatives of the deceased.

## The Town of Marysville

Has been built up almost wholly since the development of the Drumlummon. It contains about 1200 inhabitants. The town for the most part is built as nearly all mining towns are, without a thought of anything but the present, and general utility always eclipses architectural beauty in the hurry and skurry of building up a mining camp; but comfort and convenience are the more desirable when there is a choice between the two. They are to be connected by railway communication with the outside world at an early period. The Montana Central is graded within a short distance of the town, and the Northern Pacific is now completing its survey and will be there early in the spring. The town at the present time contains four general merchandise stores, seven hotels, five private boarding-houses, two churches, a public school building, and the usual number of other business houses are here located. The Orders of the A. O. U. W., Knights of Pythias and Odd Fellows are represented and are all in a prosperous condition. The former capacity of the Drumlummon mine was about 3000 tons per month, but the new plant doubles their capacity. This, in connection with the immense amount of exploratory work being prosecuted by the company, makes the outlook for Marysville remarkably bright. All of the other mines in the vicinity will be to a greater or less extent tributary to Marysville when the railroad connection is made, as then Marysville will be the nearest shipping point for the Gloster mine, the Empire, the Jay Gould mine and all the Stemple district.

From the Jay Gould mine some fabulous stories are told of the extent and richness, all of which I hope will prove true when they start up their new mill. This is some 15 miles from Marysville and is close to the Homestake mine, owned and worked by Negus & Jacobs, and is still a producer, but is not so widely heard of as one year ago. There is some talk of its being sold, yet these reports have not been confirmed.

As is usually the case, the speculator is

## Looking after the London Market

That is now so amply pleased with their investment in Drumlummon stock. The first of these

outbreaks was Anglo Montana Co. Limited. This scheme was concocted by a former employee of the Montana Co., to foist upon the London market, at an immense sum, a piece of wildcat mining property.

An elaborately written-up circular was issued, with a description of the localities and mines known as the Parker & Griff mines. A number of locations were made here and some work done to develop them. There were also certificates of some assays made by H. Longmaid, with a view of buying the ore on their dump, and which he wisely concluded not to purchase. These were taken and an immense body of ore was computed to be there, and the expense of putting a 15-stamp mill was all figured up in good shape. Then the probable profits were dilated upon until by arithmetical calculation a possible profit of some \$200,000 per annum was to accrue to the fortunate stockholders, and they were only asked to pay \$600,000 for this privilege.

High-grade ore on their dump was estimated at 430 tons, when, as a matter of fact, there is none at all that will pay to mill. Further, I am told, that the party who signs his name to the report as mining expert never was in the mine, and if he had been, would not have been capable of making a lucid report of it. He could not truthfully say he knew anything of its merits or demerits, simply on the grounds of ignorance of the subject. Taking his own report and once reading it will condemn it to any one accustomed to the business, as he goes glibly to work and from less than 1000 feet of shafts and levels he figures up a four-foot ledge to contain 180,000 tons of pay ore. This, of course, no one could for an instant believe.

My impressions are that acting as telephone boy for the Montana company is not the proper school to perfect the education of a first-class mining expert. It is to be hoped that this mining "deal" has been nipped in the bud. According to the prospectus, the so-called mining expert was undoubtedly pulling the chestnuts from the fire for other and deeper parties. Cablegrams were passed over of the developments and value of assay taken, when the real truth was that not one day's work had been done on the mine for the past 18 months.

The Sterling Gold Mining Co., Limited, is also a scheme, but has more merit than the Anglo to back it. They are attempting to float this on the London market for \$500,000, a sum that from positive evidence it can never pay interest upon.

I am sorry to know that one of Helena's citizens signed his name to a favorable report on these mines, when he really did not know where they were located, and in order that he might not give himself away in case of some one being referred to him, he drove out and hunted it up. Now, I cannot think that this is the right spirit, particularly for men of capital living among us. If outside capital is needed to develop the country, give them a show, at least, for their money, or else take the more honorable method of a short shot-gun on the highway and make them disgorge their ducats by compulsion.

Now, if the Sterling Gold Mining Co. investors will be satisfied with a very small percentage on their capital invested, of say three or four per cent, with close and economical management and no extravagant wasting of the stock, they can make it for awhile, but it will never bear up under half a million capital. The fact that this mine is worth some money is in its favor, for the Anglo scheme is worth nothing as it now stands.

## Shingle Springs, El Dorado County.

EDITORS PRESS:—Having had occasion to visit a few of the numerous quartz mines in this vicinity in the past week, I take the liberty of furnishing you with a few items respecting the several claims, which I trust may be found of sufficient interest to warrant your giving them space in the columns of your valued journal.

The Pine Hill Gold and Silver Mining Company, Incorporated, have sunk a shaft to a depth of 50 feet on their Pine Hill ledge, which is situated about five miles north of this place, developing a large body of sulphuretted ore, a quantity of which will soon be crushed by the Pyramid Mill and Mining Company to determine its positive value. The Pyramid mill is now running on custom rock from the celebrated Barnes mine and the claim of Messrs. Kipp and Boldton. This mill is furnished with the Frue concentrators and is run by water-power, using a 40-inch Knight wheel.

The Crystal mine, located on French creek, about three miles southwest from Shingle Springs, has been bonded by parties from Alameda, and, we learn, will start up immediately.

Continuing our journey about one and a half miles beyond the Crystal mine, we found ourselves at the Vandalia, owned by Messrs. Kelly and Ives. Here we met the genial Mr. J. W. Kelly, superintendent and part owner of the mine, who furnished us with a full description of the mine and mill. The company has just completed a five-stamp mill, on the most approved plan, and expects to start up at once. It has a shaft 70 feet deep on the mine and from 500 to 600 tons of ore on the dump. The mill is supplied with steam-power, having capacity for 20 stamps. This is reputed to be one of the best paying mines in this section.

One mile below the Vandalia is the Big Can-

yon mine (incorporated). Here we had the pleasure of making the acquaintance of Mr. P. Bargon, the superintendent and part owner of the mine, who kindly furnished the following information respecting the company's works. They are erecting a 20-stamp mill, which they expect to have in operation by December 10th. The mill is built after the most approved plan, and is complete in every particular.

The mortars, which were supplied by the Risdon Iron Works, are of high discharge and are placed on solid blocks of timber 12 feet long and 30 inches square.

These blocks are placed upright and imbedded in solid concrete. The stamps are of 800 pounds weight, and the batteries are fed automatically. The mill will be run by water-power, using a four-foot Pelton wheel under a pressure of 365 feet. A No. 15 Blake rock-breaker will be run by a 24-inch Pelton wheel, thus furnishing separate power from that supplying the batteries and concentrators. Eight Triumph ore concentrators will be used, which will be placed in a room 41x42 feet, supplied with numerous skylights. The sills of the building are all placed on walls of solid masonry and are raised about two feet, thus affording better protection from the elements. The sills of the ore bin are all laid in solid concrete. The timbers supporting the batteries, as also those of the ore bin, are all separate from the main building. The ledge, which is of immense magnitude (being 265 feet in width), yields five per cent of sulphurets. The company contemplates the erection of chlorination works in connection with the mine in May next.

### Evidences of Prosperity.

Perhaps the best evidence of the general return of the country to its late normal condition of prosperity is the great activity which is everywhere manifested in railroad building and extension in the increasing demand for iron of every kind and for almost every purpose. The furnaces, foundries and machine-shops throughout the country are generally overrun with orders. The demand for iron ores to keep the furnaces running are taxing all railroad facilities in that direction to their utmost capacity. These things are in marked contrast to the recent past. For several years, until quite recently, the most of our railroads have been starving for work, and reducing the cost and expenses of their rolling stock and repairs to the lowest possible minimum in order to meet the pressure of hard times and to squeeze out even the leanest dividends. The phantom of bankruptcy which hovered over many of our railroad centers and which actually took possession of some roads has been fully replaced by a reign of prosperity, which requires the fullest repairs and extra equipments. In regard to California, we refer the reader to an article in another column on the new railroad era in this State.

These facts in regard to iron and railroad matters are most unmistakable indications of a general return to prosperity. There can be no doubt that the country is now fairly on the road to an era of prosperity which will in all probability equal anything in the past. The papers which come to our table from various parts of the country all read the same way. There is no particular "boom," but there is a steady, healthy expansion of business, which is not going to "let up"—at least not in the near future. New industries are everywhere springing up, and old industries are being pushed with renewed vigor. Throughout the great West and Northwest, and the East as well, manufactories are generally busy, with a full demand for their various lines of goods, and, in most cases, orders ahead.

The latest news from Europe tells of an improved condition of business there also. Much satisfaction is expressed at the manifest improvement in this country, and that the demand in some instances, particularly in the iron trades and ore productions, is so much greater than our productive capacity that we are obliged to call on English producers for the surplus of supply demanded. For some months English producers have been looking to this country for a "boom" which shall be felt even there, and are more than half ready to acknowledge that "when Uncle Sam takes snuff the whole world sneezes."

**SODA ASH.**—About 190,000 tons of soda ash are annually used in this country. Of this, only about 19,000 tons are of home manufacture, leaving a balance of 171,000 tons to be imported at a cost of over \$4,500,000. There are various localities in the country where the raw materials for this manufacture can be readily obtained—salt, pyrites, coal, limestone and manganese. There is a large manufactory of soda at Syracuse, N. Y., working with a capital of \$1,000,000; but it is said that foreign competition is so bent on breaking down these works that it is thought they will have to succumb, unless there is a trifle more added to the present tariff. If these works are discontinued the importers will have it all their own way, and prices will be materially advanced. Sufficient protection to encourage the profitable establishment of a number of well-conducted manufactories, simply in competition with each other, would result not only in low prices, but also in a large amount of home labor beyond that now employed.

### The Minting of Gold and Silver.\*

NUMBER 5.

[By ALBERT WILLIAMS, JR.]

#### Melting Rooms, San Francisco Mint.

The gold and silver are melted in separate rooms. The gold-ingot melting room contains six furnaces 14 inches square. The plumbago pots used are Nos. 45 and 50, and occasionally No. 60. In melting gold, charcoal and occasionally hard coal are used. The silver-ingot melting room has also six furnaces 14 inches square; and the same sizes of crucibles are employed in this room. Charcoal, coke and hard coal are used as fuel. The furnaces for ingot melting are of the Feix pattern, having a series of air-chambers and a water-jacket condenser to diminish the loss by volatilization. The fluxes used are borax, niter, sal ammoniac, bone-ash and powdered charcoal. The deposit-melting room contains four furnaces 14 inches square, for melting bullion on its receipt. There are also in this room six furnaces for melting the large bars to be granulated previous to parting. Four of these are 16 inches and two are 22 inches square. The granulating tubs are of copper, having each a capacity of 100 gallons or more. Charcoal, coke, and hard coal are used as fuel. The zinc used in reducing the chloride of silver comes in slabs 14 by 7 by 1 inches. A special furnace, 14 inches square, for granulating this zinc, is in the basement. There are also two copper-melting furnaces, 14 inches square, in the basement. The copper is melted in Nos. 45 and 50 plumbago pots, and is refined by the Feix process. The sweeps room has two ovens for drying sweeps, a Chili mill, two amalgamators and concentrators, and a large vat for collecting the sweeps after washing. In the refinery, seven trucks and 24 carrying tubs are used for transporting bullion, chloride, etc. A condenser in the attic supplies 2000 to 3000 gallons of distilled water per day for use in the assay department and refinery.

#### Coiner's Department.

The manipulations involved in making coins from the standard ingots are similar to those practiced at the Carson mint with but slight deviations in method, but they are conducted on a much larger scale. The writer is indebted to Mr. Frank X. Cicott, the coiner, for full notes on the system of checks against loss or error followed in this department.

**Receiving ingots.**—The transfer clerk delivers the ingots to the coiner's department. They are weighed by him in the presence of the coiner's receiving clerk and the melter and refiner, or his representative. The delivery is made in quantities called "melts." Each melt for double-eagles is composed of 40 ingots, weighing about 3000 ounces. When the transfer clerk weighs the melts, he takes the weight, number and denomination of the ingots as well as the number of ingots composing each melt, and makes the proper entries in his book. The receiving clerk of the coiner's department and the melter and refiner's clerk do the same. Then they carefully compare their respective accounts, and if these agree the melts are turned into the coiner's office, whence they are passed into the rolling-room.

**Rolling-room.**—This is between the coiner's office and the cutting-room. The total force is eight men. Here the number and the weight are again taken and entered in the roller's book. Each melt is provided with a copper tag bearing its number, and this tag remains with it during the whole manipulation. The rolling-room contains four sets of rollers, two breakdown and two finishing, having a pressure varying from 20 to 80 tons. The rolling machines are similar to those of the Carson mint, but have not the flat guides for preventing flexure of the strips. The rolls are of cast iron (not steel, as at the Carson mint). The lubricant is castor-oil. The ingots are now drawn into strips of about 3 feet 6 inches in length by means of this flattening or drawing process, and naturally become brittle and in some cases are split or broken on the ends. To remedy the brittleness, the strips are now prepared for the annealer. First, however, the fractured ends are removed by a powerful cutting machine. The thickness of the rolled strips is tested by gauge instead of by weighing a trial planchette.

**Annealing-room.**—This is on the first floor, between the cutting and the whitening rooms. The total force is four men. The gold strips are placed in copper canisters, the silver being annealed in open pans. The canisters are of two sizes, those for "short gold" being 3 feet 10 inches long, 4½ inches diameter, outside measurement, and 3½ of an inch thick, and those for "long gold" 5 feet 7 inches long, 4½ inches diameter and 3½ of an inch thick. Each is capable of containing 20 strips. The canisters, after being capped and sealed with fire-clay, are placed in a reverberatory furnace, four at a time, where they remain for about one hour. There are four annealing furnaces. The fuel is oak. An hour is usually required with a moderate fire; much, however, depends upon the operator, he being guided solely by his judgment, as no established rule exists. The main point is to see that the heat is equal-

ly distributed, and to insure this, the canisters are turned half over at intervals of 15 minutes. Great care must be taken to avoid overheating. When sufficiently heated the canisters are removed from the furnace, by means of iron tongs, into vats containing cold water, and in three or four minutes the caps or seals are removed so as to allow the water to enter. When sufficiently cooled, the strips are dried with cotton cloths and then removed to the rolling-room to be passed through the finishing rolls and reduced to the required thickness; i. e., the thickness of the coin for which they are intended, which could not be done prior to the annealing, by reason of their brittleness. This operation completed, the strips are again returned to the annealing-room for final annealing, which is a necessary preparation for the cutting machine.

**Cutting-room.**—The cutting-room is on the first floor at the west side of the building, between the rolling and the annealing-rooms. The force employed in this room is nine men, and two others are engaged in the cleaning-room. From the annealing-room the strips are taken to the pointing machine, which shapes the end of each strip so as to admit it with facility in the office of the draw-bench, where the strips are reduced to the exact thickness necessary. Before being subjected to the operation of the draw-bench, however, the gold strips are heated to a temperature of 100° F. in a steam chest, and then they are separately covered with melted wax. They are now taken to the draw-bench; one strip is drawn through and passed to the cutter, who cuts off one planchette from the first end and one from the middle of the strip. These planchettes are passed to the foreman of the cutting-room, who weighs them. If he finds them correct, the strip is cut into planchettes. This same operation is performed with each strip. If one is found too heavy it is again placed in the draw-bench and reduced; if too light it is placed upon the "light bench," when it is cut by a concave punch, thus correcting the deficiency. There are three draw-benches and four cutting-presses in this room. When all the strips are cut the planchettes and clippings are sent to the cleaning-room.

**Cleaning-room.**—Here they are boiled in a solution of potash, for the purpose of removing the wax and rendering them perfectly clean. After this they are rinsed in boiling water and dried in a pan heated by steam. When perfectly clean and dry the planchettes are adjusted. The clippings and chips are returned to the transfer clerk in the same manner that the ingots were received.

**Adjusting-room.**—Gold planchettes are treated as follows: Each planchette is weighed separately, and if too heavy it is reduced by filing the rim by hand; if too light, it is passed to the "light weigher," who weighs it, and in case it is found to be below the legal limit condemns it. The "standard weighers" weigh every standard gold planchette several times to insure correctness. The adjusting force includes 59 women adjusters and weighers and one forewoman. After all the planchettes have been adjusted, the assistant adjuster takes the different pans of standard planchettes and makes them up in what are called "drafts" of 1000 pieces each. These drafts are again weighed in the coiner's weigh room. In the case of double-eagles the draft weighs 1075.10 ounces, being 0.10 ounce in excess of the legal weight, the surplus being added for loss in whitening and pressing. The legal tolerance allowed on the double-eagle, light or heavy, is 0.5 grain. The working limit used is 0.1 grain on the "standards" and 0.3 grain on the "lights." The "standards" and "lights" are kept in separate boxes containing cards setting forth the exact weight and date of adjustment. The "condemns" are also kept separate, and are so marked.

Silver planchettes are not adjusted by hand, but those for the large coins are, if necessary, filed by lathes in the coiner's weigh-room. There are two of these filing machines in this mint, and one has been furnished to the New Orleans mint. They reduce 20 pieces at a time very conveniently and rapidly. The strips for dimes and quarters can be adjusted without difficulty at the draw-bench, but those for half-dollars require much care to keep them within the prescribed limits.

**Whitening-room.**—The gold blanks are placed in iron flasks, which are sealed with fire-clay and placed in the heating furnaces. Silver blanks are charged into the furnaces in copper pans. When thoroughly and uniformly heated the blanks are thrown into a hot bath of water acidulated with sulphuric acid, the same kind of pickle being used for both gold and silver. After remaining in the bath four or five minutes, during which time they are stirred with copper rakes, the blanks are removed, rinsed with boiling water and dried in steam-heated open pans with basswood sawdust, being stirred with wooden paddles until dry. The wastage of gold blanks is reported to be the same as at Carson; that of silver blanks is stated at from 0.20 to 0.30 grains per draft treated. The force employed in the whitening-room is a foreman and four assistants.

[TO BE CONTINUED.]

**NAIL MANUFACTURE.**—Down to 1883 all the cut nails in the United States were made of iron, but in that year 18,224 kegs of steel nails were made, in 1884 the number of kegs was 393,482, and in 1885 it amounted to 1,823,127 (91,156 tons net), including a small quantity of combined iron and steel nails. The credit of

first applying steel to the manufacture of nails is due to Sir Henry Bessemer.

It is now a serious question with the majority of nail manufacturers in New England as to whether they shall put in Bessemer plants or go out of the business. Go out of the business they must if the attempt is made to compete with steel nails and with manufacturers who have facilities for obtaining the steel at the cost of the raw material and converting. Were the conditions of labor favorable, the question would at once be answered in favor of the Bessemer plant. But it is believed that the Knights of Labor will soon make the attempt to advance the rate of wages of nail-workers in New England to the figures which are paid in Pittsburg. This is a condition, however, to which the New England manufacturer cannot consent and live. Cheaper iron and coal enable the Pittsburg manufacturer to pay better wages than is paid in New England, and the recent wonderful development of natural gas has still further added to his advantage. The only feature which counts in favor of the New England manufacturer is the near market in which to sell his goods—the cost of freight to that market tells against Pittsburg. Under such conditions the New England nail industry is evidently in the keeping of the Knights of Labor. Any material advance in the present rate of wages there will send that industry to Pennsylvania.

### The Use of Liquid Fuel.

It appears, after an experiment of several months, that ferry-boats plying between this city and Oakland, which had been fitted up for burning petroleum, have now gone back to coal. The economy, as we understand, so far as the consumption of fuel is concerned, is said to be decidedly in favor of petroleum; but the trouble in its use came from the intense heat produced, by which, or by the peculiar nature of the combustion, the iron of both the furnaces and boilers began to indicate rapid deterioration; hence the return to coal. If the facts in the case are as stated, Russia is certainly ahead of us in one particular. It is stated, apparently on good authority, that her engineers have applied liquid fuel in various ways to 200 steamers, more than 700 locomotives, and about 1000 stationary engines. England is following slowly in the same direction; two pioneer steamers, now in the course of construction at West Hartlepool, will burn petroleum under their boilers. One of these steamers will be employed to carry petroleum from this country to England.

It would appear from this that there must be something faulty in our method of burning the petroleum. Can a country so largely interested in the production of petroleum as this afford to be outdistanced in the method and variety of its use by Russia?

#### How Boilers are Often Injured.

It is barely possible that sulphur may be present to some small extent in the petroleum used on the Oakland ferry-steamers. We have not an analysis of California oil before us, and we are not aware that any has ever been made; but it is well known that sulphur is a very destructive element, even in quite small quantities. As a corroding agent in contact with steam boilers it has of late attracted increased attention, and as a cotemporary correctly remarks, "it is now recognized much more generally as a source of trouble and expense than it was a few years ago. Improved inspection service and a better appreciation of the importance of keeping not only the interior but also the exterior of a boiler in good condition, readily account for this. Careful examinations of the heating surfaces of boilers have taught lessons of the greatest practical value, and among them that relating to the rapid destruction of boiler plates by the action of sulphur in its different forms, as evolved by the coal, has not been the least important. Not only is sulphur directly brought in contact with the heating surfaces by sublimation, tending to produce red-shortness in the exposed plates, but it is also given opportunity to act in the forms of sulphurous and sulphuric acid held by soot deposits. Corrosion due to absorption of sulphurous-acid gases by soot and subsequent conversion into sulphuric acid by the presence of moisture has been known to be extraordinarily rapid, and in view of this circumstance it should be almost unnecessary to urge upon boiler-owners the adoption of every reasonable preventive measure."

In the use of petroleum, sulphur, even if present, would not be deposited with soot, as is the case with coal, but when brought in direct contact as a vapor with heated iron, it would, no doubt, prove very destructive. Both convenience and economy may well be urged in favor of a liquid or gaseous fuel, and every effort and the most exhaustive knowledge and skill should be brought to bear in the direction of making such fuel practicable for use on steam-going vessels. If the reports in regard to Russian practice are correct, and of that there can hardly be a doubt, there is good reason why our engineers should look for a cause for the different results realized there and here. There can hardly be a doubt but that petroleum will become the ocean steam fuel of the future, and notwithstanding the recent failure, petroleum will yet be employed as steam fuel upon the bays and rivers of this State.

\*From the census report on the "Statistics and Technology of the Precious Metals," by S. F. Emmons and G. F. Becker, special agents. The description of the mints and the processes applies to the year 1881, at which time the mints were examined.

#### Passing Events.

An abundant rain has fallen all over the State this week, filling the streams and ditches, much to the delight of agriculturists and miners. Of course, now that there is no hydraulic mining, the water is not so generally important to the mining industry, but it is needed in drift and quartz mining as much as ever. Many quartz mines now use water for power.

Numerous failures of brokers have resulted from the state of affairs in the stock market during the past week. No such excitement as the present has occurred for years in the mining share market. Instead of a steady advance, however, during the past few days, there have been very decided fluctuations in prices, as our stock tables show.

In most of the mining camps, except the warmer ones in California and Arizona, prospecting has been stopped by the advent of the snows. In many places mining has been altogether stopped. The largest companies, however, are now outfitted almost everywhere to carry on work all winter.

THERE is no noteworthy change in quicksilver. For the first 11 months of the year the receipts at this port were 15,964 flasks, against 23,589 flasks in the same period last year. The exports by sea during this time were 9766 flasks, against 16,100 in the same time last year. The volume of the quicksilver trade has fallen off sharply during the past three years.

#### Gold and Silver on the Comstock.

The ore from the great Comstock lode in Nevada is generally classed as silver, and few people are aware of how large a percentage of gold is produced. From the earliest period, however, the proportion of gold has been large, in fact pretty nearly one-half. Baron Von Richtofens' estimate of the yield of the Comstock to the close of 1865 was \$48,000,000, of which \$15,250,000 was gold and \$32,750,000 silver, the percentage of gold being 31.77, and silver 68.23. In the Belcher mine from Jan. 1, 1871, to Dec. 31, 1873, when the mine produced \$15,529,427, the gold yield was \$8,813,196, and silver \$6,716,231, the gold greatly exceeding the other precious metal. Between May 1, 1864, and May 1, 1877, when Crown Point was paying, it yielded \$23,929,460, of which \$10,166,656 was gold and \$13,762,812 silver. At a certain period when the Gold Hill group, Crown Point, Belcher, Yellow Jacket, Imperial and Empire yielded \$45,903,149, the gold was \$47.25 and silver \$52.75 in the total. At a period when the Savage, Gould and Curry, Hale and Norcross and Chollar-Potosi yielded in the aggregate \$30,278,046, the gold proportion was \$35.93 and silver \$64.07 in the hundred dollars.

In the Bonanza group, the Consolidated Virginia had produced up to the end of 1880 \$64,970,777.95, of which the gold was \$29,075,338.75 and silver \$35,895,438.98. California, to same period, produced \$46,736,831.44, of which the gold was \$23,308,012.69 and silver \$23,428,818.75. Without going into close details of total production of these mines (now one incorporation), it is sufficient to say that the proportion of gold still holds about the same. The total yield for the fiscal month of November for Consolidated California and Virginia was \$387,824, the shipments having been as follows:

November 6.....	\$ 54,069
November 13.....	38,786
November 20.....	46,821
November 27.....	101,633
November 30.....	34,492
December 4.....	61,768
December 6.....	50,265
Total.....	\$387,824
Total for October.....	206,742

The November bullion shows a little over 40 per cent in gold. The proportions are as follows:

Gold.....	\$168,788
Silver.....	219,036
Total.....	\$387,824

The October bullion was also over 40 per cent gold. The ore report for the week ending on the 4th inst. shows that 1066 tons were sent to the Morgan mill and 1848 tons to the Eureka mill, the assay value in the batteries being \$40.03 per ton. On ore assaying \$40 per ton there is a royalty to the Sutro Tunnel Company of \$1 per ton. This royalty is \$2 per ton when the assay runs over \$40 per ton. The last four weekly ore reports are as follows:

	Tons.	Assay.
November 13.....	2736	\$36.67
November 20.....	2805	44.22
November 27.....	2799	42.17
December 4.....	2914	40.03

The census officials compute the total yield of the Comstock from its discovery to Dec. 31, 1880, as \$240,670,145.92. Of this the gold aggregated \$102,371,988.06, and silver \$138,298,157.86. In each \$100, therefore, there was \$42.54 in gold and \$57.46 in silver. From these statements it will be seen that there is almost as much gold as silver produced from the mines on the Comstock lode.

**DEATH OF J. F. OSBORNE.**—We regret to announce to the many acquaintances whom he has made in the course of his business, the death of Mr. J. F. Osborne, who has for the last seven years been engaged on this paper in the advertising branch. Mr. Osborne's death is supposed to have been caused by fatty degeneration of the heart, and the event was sudden, while he was alone in his room at his hotel at East Oakland. Mr. Osborne was of English birth and has parents still resident there. He was about 45 years old and unmarried. He was energetic in business, easy in address and successful in his chosen line of work. The funeral services were held in Oakland on Thursday afternoon, Rev. Dr. W. W. McKaig officiating.

THE Texas & Pacific and other American roads are ordering large quantities of steel rails from Europe, all the mills in the United States having orders that they cannot fill.

#### Dividends and Assessments.

No doubt some persons had a vivid recollection of the large and numerous dividends paid by the California and Consolidated Virginia mines during the bonanza days, when they made up their minds recently to invest in the stock now representing these consolidated properties. But 99 out of every hundred buyers of mining stocks appear to care very little for the dividend-paying feature. This is shown by the fact of their investing in all the stocks on the list indiscriminately. The majority of these mines never paid any dividends and never had any chance to do so. Many of them have been "developed" as stock operations, and machinery put on them in order that directors and other insiders could make money in various ways, but with no expectation at all of making a legitimate paying mining proposition out of the property. These facts are well known. Any one familiar with the Comstock can point out this class of mines. Yet the stocks representing such mines are daily quoted in the list of "securities." They have advanced from cents to dollars in the upward range of prices during the present excitement in shares. It is one of the baleful influences of stock operations that absolutely valueless claims are given such fictitious value. Ignorant persons buy the shares and deal in them. They all hope to make money out of the rise of the stock, rather than profit from the mine itself.

For these reasons legitimate mining operations suffer more or less. People, in developing a claim properly, to make a mine out of it, do as little trading of stock certificates as possible, and they generally have some little difficulty in getting men to invest. But once made a stock-jobbing operation and all sorts of persons will buy the certificates. The stock-jobbing field, in times of excitement like the present, affords excellent opportunities for the unscrupulous to take advantage of a confiding public.

For the benefit of those dealing in Comstock shares, it may be stated that the investigations of the Census Bureau developed the fact that there were, up to the end of 1880, 16,906 mining locations in and about the Comstock. In Virginia district there were 8305, in Gold Hill district 7364, and outside districts 1237. This was from 1859 to 1880.

Now let us consider the dividend and assessment feature. It is true that the figures up to the date mentioned showed many millions more disbursed than were collected. That is, the amount paid in dividends far exceeded that collected for assessments. Washoe mines paid, to end of 1880, 399 dividends, aggregating \$115,871,100, and there were 1090 assessments levied, aggregating \$61,715,535. This showed a profit of \$97,547,430; loss, \$43,391,865.

It will be interesting also to note the fact that of the nearly 17,000 locations, only 103 are reported by the census officials as being listed on the stock board and having any record. The following will show the mines which have paid dividends up to and including 1880, with the number and amount:

	No. of Dividends.	Amount.
Belcher.....	38	\$15,397,200
California.....	34	31,320,000
Confidence.....	6	78,000
Con. Virginia.....	51	42,390,000
Crown Point.....	50	11,588,000
Daney.....	2	56,000
Gould and Curry.....	36	3,526,000
Hale and Norcross.....	39	1,598,000
Kentuck.....	32	1,252,000
Ophir.....	24	1,595,800
Savage.....	59	4,460,000
Sierra Nevada.....	11	102,500
Succor.....	2	22,800
Yellow Jacket.....	25	2,184,000

An analysis of the table from which we compile these figures shows that of the 103 mining companies reported, 6 show an excess in amount of dividends over assessments, and 97 an excess in amount of assessments over dividends; 14 have paid dividends and 102 have levied assessments; 1 has paid dividends and levied no assessments; 80 have levied assessments and paid no dividends; and 13 have paid dividends and levied assessments. Still, as stated, the aggregate dividends have been, from Washoe mines, \$115,871,100, and aggregate assessments \$61,715,535.

It is pretty conclusive that a very few paying mines can bring up a great many in the same locality which have never paid and never will. It is this fact that makes a stock market possible, for if all these mines relied on their own merit there would be very few "stock booms." The instinct for gambling is however a better motive for such booms.

#### The Patent Office.

We have several times pointed out the fact that the Patent Office Department of the U. S. Government was more than self-sustaining. The fees received pay all the expenses and leave a handsome surplus each year. Nevertheless, the office has been for some years crippled for lack of assistance. The money received has to be turned into the U. S. Treasury, and the office is run on appropriations by Congress, so it never gets what it earns. Last year all work in the office was very much behind, and even this year there has been considerable delay in getting patents, though improvement is shown. President Cleveland, in his message to Congress, has this to say of this Department of Government:

"On the 4th of March, 1885, the current business of the Patent Office was on an average five and a half months behind. At the close of the last fiscal year such current work was but three months in arrears, and it is asserted and believed that in the next few months the delay in obtaining an examination of an application for a patent will be but nominal. The number of applications for patents during the last fiscal year, including reissue, designs, trademarks and labels, equals 40,678, which is considerably in excess of the number received during the preceding year. The receipts of the Patent Office during the year aggregated \$1,250,167.80, enabling the office to turn into the treasury, over and above all expenditures, \$163,701.73. The number of patents granted during the last fiscal year, including reissues, trademarks, designs and labels, was 25,619, a number also quite largely in excess of that of any preceding year. The report of the commissioner shows the office to be in a prosperous condition and constantly increasing in its business. No increase of force is asked for. The amount estimated for the year ending June 30, 1887, was \$853,960. The amount estimated for the fiscal year ending June 30, 1888, is \$778,770."

#### Coal and Iron.

Although the iron market in the East is more active than it has been for some years, and orders for rails are being sent abroad, it still remains very quiet here. The foundry business, however, is showing some signs of improvement. Dealers in metals hope that the building of a Government cruiser here will help trade. Prices remain at about the same figures they have been for months.

In October we received at this port 155,000 tons of coal, while last month the receipts were only 84,200 tons. The total for the first 11 months of the year is 876,000 tons. The coal market is pretty steady. It is stated that a Los Angeles capitalist is arranging for the building of a steam collier to carry coal from the northern mines direct to Wilmington harbor. He speaks of having the vessel built East when he ought to build her here, where we now have all the appliances. There is a fair inquiry for vessels to carry coal from the northern mines to this and ports more southerly. A local authority says that there are "strong reasons for improvement, as our visible supply from foreign sources is growing gradually less and coast freights have materially advanced the past two weeks, and a unity now exists among our local ship-owners that will lead to their property now paying a fair interest, which it has not done for over a year, as the low import cost of foreign coals would not permit consumers to pay a covering freight to our coast carriers. The major portion of our consumption for several months will require to be drawn from the northern collieries, some of which will be taxed to yield the called-for supply; but in no case may a coal famine be anticipated, as in some of our local collieries the output can be readily doubled or trebled, if carriers can be had to make delivery. Advice from Australia, just at hand, report a marked advance on coal freights and a great scarcity of tonnage, even at enhanced rates."

THE NEW CABLE LINE.—Ground was broken on Washington street below Fillmore, this week, for the proposed Jackson-street cable line. It is the intention to complete the road by next summer.

MINERS are still rushing to the recently discovered silver mines at Sten's Pass, on the Southern Pacific, in New Mexico.

## Machine and Hand Drills in Mines.

At the Drumlummon mine, in Montana, for the purpose of running machine drills and small pneumatic hauling engines underground, a compressor is employed of sufficient capacity to work from 25 to 30 drills, each having a cylinder of 3½ inches in diameter. These drills are used in sinking, driving, rising and in stoping out quartz for the mills, and it is found that they not only materially quicken the result of each operation, but render the undertaking less dependent upon manual labor than if hammers and drills were alone in use. The approximate rate of speed and relative number of hands consequent on the use of the two methods will be seen from the following figures, giving rate of speed per month:

	Machine Drills.	Hammer and Drills.
Sinking shafts.....	50 to 55 feet.	15 to 20 feet.
Driving levels.....	50 to 90 feet.	18 to 25 feet.
Stopping ground, per drill.....	300 to 400 tons.	80 to 70 tons.

The relative number of hands required (15 machine drills in use) is as follows:

Hammer and drillmen required to do the work of 15 drills.....	150
Drillmen required to equal work of 150 hammer and drillmen.....	30

Difference in number of hands.....120

It is stated by consulting engineer, John Darlington, in his report to the directors of the company, that in the use of machine drills, the cost of explosives is nearly two-fold more than the cost incurred in the use of hand-drills, that is, to do an equal quantity of work, while the cost of maintaining the compressor, together with cost and repair of drills must be taken into account. Against these items, however, must be set the cost of 120 miners' wages per day, the impossibility of combining a number of men together to do the work of a single drill, the rapid speed with which the mine is opened out, and the comparative saving of "dead charges" consequent on the attainment of a high rate of speed in the execution of underground work.

## Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last, President Davidson in the chair.

Among the donations to the museum was a stone (Jade) axe used by the natives of Alaska in making canoes. It was presented by Judge W. Clark. Prof. Davidson stated that this was a very fine specimen. He described the method employed by the natives in using this axe, to which no handle is affixed. Mr. Gordon Bradley presented 17 specimens of ore, comprising native silver, copper, tin, etc., from Arizona and Mexico. J. T. Gibbes presented three specimens of silver ore from the Bolanos mines in Mexico, with maps of the district.

President Davidson stated that on the nights of November 13th and 14th last he had instituted a careful search in the constellation "Leo" for the purpose of discovering any meteoric showers, which were said to be due at that time after a lapse of 33½ years. He failed to see any shower, or even a single meteor, and he gave his negative evidence for what it was worth.

The following gentlemen were appointed a nominating committee to select the regular ticket for election at the first meeting in 1887: William Norris, E. Bosqui, Leo Eloesser, W. S. Keyes and W. A. Aldrich.

Prof. S. B. Christy, of the University of California, read a paper on "Rustless Iron" and its application to architecture and engineering.

**MOTIVE POWER FROM ARTESIAN WELLS.**—A flour mill in New Jersey is supplied with electric light by motive power derived from a turbine which is set in motion by the water of an artesian well, sunk especially for this purpose. Artesian wells have recently been sunk in several parts of London in order to render the proprietors independent of the water companies. Wherever the rise and the quantity of flow is sufficiently great, these fortunate individuals are in a position to provide themselves with electric light at a very low cost.

The Mount Pleasant mine, at Grizzly Flat, El Dorado county, which was temporarily shut down last month, will be worked on a much larger scale than before in a short time. The mine is looking well.

## Permanent Assay Furnace.

Walter Lee Brown has issued a second edition of his very useful "Manual of Assaying," published in Chicago by E. H. Sargent & Co. The work has been thoroughly revised, corrected and enlarged. It is well printed and arranged. The accompanying engraving is taken from this work. It is a brick furnace which is a modification of Plattner's, constructed for Wm. J. C. Jackson, of Chicago, and is suited to the necessities of any assayer.

The various stamp mills, smelting and sampling works, etc., in the mining regions have usually permanent furnaces for their assay work. The engraving is a vertical section. The scale is one thirty-second. The muffle half of

Permanent Assaying Furnace.

the furnace is at the right and the crucible furnace at the left, both constructed of fire-brick. The lower half of the muffle furnace is anchored with 1½-inch wrought-iron bars and ties, and the upper part with those 1½ inch. The

Fig. 2.—Section across Longfellow Hill and Chase Creek Canyon. (See page 373.)

muffle appropriate for this furnace is the L. Battersea, 15x9x5½ inches. Coke or coal may be used.

## Mining in Spain.

The soil and rock of the peninsula abound in mineral wealth, and there is no doubt that, were capital and enterprise forthcoming, Spain would have no occasion for importing either ores or manufactured metals.

The following is a comprehensive list of minerals common to Spain: Iron and argentiferous iron, arsenical pyrites, ochres, lead and argentiferous lead, copper and argentiferous copper, silver, gold, tin, zinc, copperas, alkaline salts, quicksilver, antimony, cobalt, manganese, coprolitic earths, sulphate of baryta, alum, graphite, amber, anthracite, bitumen, common salt, sulphate of soda, topaz, phosphate of lime, lithographic limestone, fluorspar, steatite, kaolin, asbestos, argillite or plastic clay, sulphur, coal, lignite, peat, bituminous shale, asphaltum, petroleum, naphtha, and a variety of mineral waters.

**CEUR D'ALENE.**—Late advices from this section report the new 10-stamp mill of the Golden King Mining Company, of Louisville, Ky. (built by the Pacific Iron Works of San Francisco), as running very successfully, and the Duncan concentrators, with which the mill is equipped for saving the sulphurets, as being a complete success.—*N. Y. Mining Record.*

## Foundry Notes.

There is some indication of an improvement in business at the foundries, several of the larger ones having more orders on hand than for months past. The granting of the contract for Cruiser No. 2—the *Charleston*—to the Union Iron Works is, of course, a most important event for our local industries. It will provide labor for many additional mechanics, and give a decided impetus to iron and steel ship-building on the Pacific Coast. The Union Works have secured another contract for building a \$200,000 steamer for the coast trade.

The Pacific Iron Works have just finished a 60-ton copper smelting plant for the Atlas Mining Co., near Red Rock, about 50 miles from Tucson, Arizona. Mr. Foss went down a few days since to start the plant, which will be in working order by March 1st. The mine was discovered by J. W. Harker, but is now owned by a Chicago company. They have some 8000 tons of ore on the dump ready for the smelter.

The Pacific Iron Works have been unusually busy of late. Among their more recent orders may be mentioned the following: A 10-stamp gold mill, with Duncan concentrators, for the Chipana mine, near Iquique, Chile; 10 Duncan concentrators for the Mina del Rey mine, Peru; 12 Duncan concentrators for the McCoy mine in Georgia; 6 Duncan concentrators for the Divisadera mine in Honduras; a set of hoisting works for the Silver Star Co., of Nevada; a set of hoisting works for the Golden Star Co., of Inyo county; a 150-horse power Hazelton boiler for the Oakland Cotton Mills.

## Mining Accidents.

Josiah Palamoutain, who was recently hurt in the Idaho mine, died from his injuries.

W. H. Russell fell down the shaft of the Mayflower mine, Forest Hill, Placer county, on the 2d inst., and was instantly killed.

A dispatch from Georgetown, Dec. 3d, says:

D. Hogan and his partner, a man named Pomeroy, were "caved on" in a prospecting tunnel about one mile south of Garden City, to-day, Hogan being killed outright, while Pomeroy sustained severe injuries.

Richard Chenoweth, of the new North Star mill, Grass Valley, was severely injured last week by a fall from a scaffold. Both arms were broken.

James Podesto was killed at the Mammoth tunnel, Amador county, last week, by falling down a chute a distance of about 80 feet. He was working at the drill at the top of the chute, when he lost his balance and fell down the chute, and was killed instantly. Thos. Dwyer, who was working with him at the time, also lost his balance and fell, but caught on to a piece of spiling and saved himself.

The Society of California Pioneers has passed a resolution asking the trustees to amend the Constitution so as to permit the use of all sums of \$10,000 in the Relief Fund, in addition to the interest on that amount, for the relief of needy members of the society.

CONGRESSMAN KELLEY, of Pennsylvania, after a trip through the Southern iron districts, declares that the negro labor there is as well paid as the white labor of Pennsylvania.

The Carson Index predicts a boom within a year in the section through which the Carson & Colorado railroad passes.

## Mining Notes from Abroad.

Tin, cobalt, nickel, bismuth, and uranium have never been found in Turkey, but chrome iron ore, emery and copper are plentiful. Coal is found only in the basin of the Eregli and Amastra on the Black sea. There are numerous petroleum wells on the Persian frontier.

Considerable deposits of sulphur are found in the gypsum formation of Upper Silesia, especially at Pschow and Kokoschutz, near Ratibor.

Chinese diamonds are chiefly brought from the province of Shantung. Men put on thick shoes of straw, and simply roam about the valleys and the rivers. The rough and pointed diamonds penetrate into the straw and stick fast. The shoes are finally collected together and burnt, the diamonds remaining in the ashes.

Some grains of gold from Cornwall have been found to contain: gold, 92.34 per cent; silver, 6.06 per cent; iron, a trace; silica and lass, 1.60 per cent. A fine specimen of filiform native silver, obtained many years ago from the same locality, gave: silver, 99.05 per cent; iron, 0.59 per cent. Neither gold nor copper was present, and the iron might be derived from traces of associated iron pyrites.

## Personal Notes.

A. J. Bowie, Jr., has returned to this city from Mexico, where he has been examining some mining property.

Gardner F. Williams, M. E., who is now in London, will probably go to the African gold fields before returning to San Francisco.

Mr. Geo. W. Dickie, of the Union Iron Works, has returned to San Francisco from Washington, where he went in the interest of his company in connection with the contract for building the new cruiser for the Government.

Mr. Foss, the furnace man, has gone to Arizona to put up a copper smelter for the Pacific Iron Works.

Prof. S. B. Christy, of the University of California, during his recent visit East, visited and inspected all the mining and technical schools and colleges on his route.

Marsden Mansom, engineer of the State Harbor Commissioners, was at the last meeting of the Engineering Club of the University of California, and described to the members the engineering structure on the water-front of San Francisco.

**LUMBER FROM WOOD PULP.**—A correspondent of the *Toronto Globe*, writing of the possibilities of pulp as a substitute for lumber in the manufacture of furniture and other articles now exclusively made of wood, calls the attention of capitalists to the facilities afforded by northern Canada for obtaining the best pulp-making woods. In some localities, he says, the forests are at the best age for pulping purposes, and would yield from 40 to 120 cords per acre if the whole of the timber were utilized. By mixing the pulp with clays, steatite, asbestos, plumago, mica, etc., substances of every possible color and compactness may be produced.

The zinc mines at Roanoke, Va., are stated to have been sold to an Englishman for \$600,000 cash. These zinc mines have been but slightly developed, but it has been understood, for some time, that experts, both from home and abroad, have pronounced the product of unusual richness, with indications of a yield almost without limit.

The Calumet & Hecla Copper Mining Company, of Michigan, paid a dividend of \$5 per share on the 10th. The amount of this dividend is \$500,000, and makes \$1,500,000 paid in dividends this year by this company; and yet it has not been a good year for copper mining.

A rumor is afloat that the Benson, Arizona, smelter is going to resume operations, and if the report prove true a large number of men will be given employment, and ore will be shipped to Benson in great quantities, which will revive business there.

**THE ELECTRIC RAILWAYS OF THE WORLD.**—It is stated that the number of electrical railways and street cars now in existence approaches the respectable number of 80.

The Small Hopes Mining Company paid a dividend of \$50,000 on the 29th November, making \$2,412,500 to date.

## MECHANICAL PROGRESS.

## Improvements in the Steam Engine.

Two alleged important improvements in the steam engine have just been made public. The first is the invention of a young man—name not given—in Iowa, which is described by the *Industrial World* as follows: He dispenses with the steam chest and the governor balls which have for so long been regarded as indispensable to every engine, whether well regulated or otherwise. In place of the latter he employs a pendulum, which permits the overflow of steam at an unvarying speed, but the slightest increase in velocity in the engine lessens the time that the steam has to escape into the cylinder. The apparatus thus effects an instantaneous check upon its own irregularities, which is comparatively slow when the governor is used; and it has the additional advantage of using less steam, while it largely simplifies the working gear. A trial engine was constructed recently, and works to a charm. It was taken down for shipment to Minneapolis, where it will be practically tested at real work. If it succeeds as well as it now promises to do, it will probably be the first of many thousands of engines built on the new plan, and may lead to wonderful results.

The second improvement alluded to is that of the "Merchant engine," so called, a recent English invention which is attracting considerable attention in England, and for which it is claimed that the difficult problem of the return to the boiler of steam which otherwise would be wasted has now been practically solved by it. Several stringent tests have been made by this engine under the superintendence of responsible engineers previously unacquainted with it, and the result of one of the most recent may be here given: "The stated effective horse-power of the engine (933) was obtained at the expenditure of 0.803 pounds Welsh coal per horse-power per hour, and we hereby certify to such ascertained result." The boiler pressure was 241 pounds per square inch, the average vacuum in the condenser 17 inches, and the speed 125 revolutions per minute. The results thus obtained work out to a fraction over half a pound per indicated horse-power per hour. The economy in coal is such that it is calculated that the Peninsular and Oriental Steamship Co. would save \$5000 per day by the use of such engines. As the condenser occupies only a sixteenth of the space of an ordinary water condenser, it is adaptable to locomotives, which might, says Mr. Merchant, the inventor, be built to run 1000 miles without a fresh supply of water.

## Tinned Springs—A Curious Experience.

Recently, a Birmingham manufacturer had occasion to endeavor to coat the surface of some hardened and tempered steel springs with tin, a bright and non-corrodible article being required. The springs are C-shaped, and are about half an inch wide, terminating in two points, by which they are held, and on which they swivel. Large quantities of them had been previously galvanized, and it was found perfectly easy to coat them with zinc, and so regulate the temper in the first instance that the springs retained the necessary temper when finished. When, therefore, the attempt to tin them was first made, it was thought that the temper would be lowered and the spring softened; but the contrary of this was the case. The springs were hardened in oil and then tempered to the proper point, after which the tinning was effected. As soon as the springs were tinned, it was found on testing that they were so brittle that the least pressure caused them to break into fragments. A long series of experiments confirmed this remarkable result, and it was eventually found necessary to pursue an entirely different course. The springs are heated to a white heat and hardened in oil, being then set aside for a day and allowed to dry. In tempering them, they are allowed to reach a dull red heat, and it is found that, when subsequently tinned, the right temper is obtained. The most remarkable feature in the case is that, unless the springs are hardened and tempered, the tinning has no appreciable effect on the hardness or temper of the steel. It would, therefore, appear that the molecular change effected by hardening and tempering the steel leads up to this remarkable action in tinning. At present the cause is not clear, but some of our readers may be able to throw some light on this matter.—*Industries*.

JOE MACHINERY AND REFRIGERATION.—The rise and progress of the ice machine and refrigerating apparatus is one of the most remarkable features of present machine practice. There are only two varieties—those of compression and absorption. In compression practice the competition is not even surpassed by the steam engine. The surprise at the variety of names, manufacturers and titles is only met by that at the very small difference in the details of construction. Each of the constructions is exhibited as far superior and more economical than any other, and yet no data are presented to enforce such claims. Comparing the two independent methods of compression and absorption, we have the value of the first based upon high-priced and expensive compressors and engines, that of the second simplicity of construction and quietness of operation. While in the first case lofty or widespread (and we might

say noisy) plant displays itself as a work of art in machinery practice, in the second, massive construction and quiet operation attract the attention and give rise to the question as to whether the plant is operating at all. A specially bad feature of the compression system is the necessity for duplicate plant consequent upon the great liability to a break-down, due to the extremely trying work coming upon the machinery of this system. No matter how small the plant, duplicate compressors and engines are an admitted necessity. In the face of this extra expense, however, machinery is cheaper than ice itself.—*Ex.*

ANNEALING TENACIOUS STEEL WIRE.—Col. Maitland's method of annealing highly-tenacious steel wire is given as follows by Dr. Percy, president of the British Iron and Steel Institute: The wire was in three pieces, each from three to three and one-half inches long, which together weighed about eight grammes. They were packed round with asbestos to check chilling, and pushed into a combustion tube about eight inches long. At each end of the tube a plug of copper gauze about one and one-half inches long was inserted, the pieces of steel wire and asbestos lying between those two plugs. One end of the tube was sealed and the other drawn out fine. The tube having been thus arranged and placed in a gas combustion furnace, the plugs of copper gauze were first heated to redness with a view of absorbing the oxygen in the tube; afterward the pieces of wire and asbestos were heated to a very full redness and kept at that temperature for half an hour. The gas was gradually lowered and then extinguished, after which the top of the furnace, the bottom and sides of which were of clay, was covered with a tin-plate screen and left until the following day, when the wires were withdrawn; they were slightly dulled on the outside, but quite superficially.

ROLLING SMALL WIRE RODS.—A patent has recently been granted to Benjamin Weaver, of Pittsburg, Pa., for improvements in rod-rolling mills, which have for their object the rolling of small wire rods such as are used for fence and telegraph purposes. These are at present obtained by what is known as the wire-drawing process, it being impossible to roll the smaller sizes of wire rod with the mills now in use. Mr. Weaver's, it is claimed, will combine in its operation both the rolling and drawing processes. This is made possible by the peculiar construction and arrangement of the mills and their driving mechanism, by which the rod is passed automatically through two pairs of rolls, the second pair of the series drawing it through the first pair. This operation is repeated in succeeding sets or series of rolls until rods of the desired size are obtained. Experiments have, it is said, left no doubt of the practical value of this invention. It is stated that a syndicate of prominent rolling-mill owners have offered Mr. Weaver \$80,000 for his patent.

SCHOOL OF MECHANICAL ARTS.—The California School of Mechanical Arts was endowed by the late James Lick with \$540,000. The object of the fund was to educate males and females in the practical arts of life, such as working in wood, stone, iron or other metals. The trustees are: Horace Davis, A. S. Hallidie, John O. Earl, John H. Boalt and William Ashburner. A conference will soon be held with President Holden, of the State University, Prof. Rising and others in regard to the best means of starting the school. The trustees have been in communication with instructors of technical schools in the East, and have received considerable information.

IMPROVEMENT IN RIFLE MANUFACTURE.—Great improvement has recently been made in the manufacture of rifles; 120 barrels can now be rolled in an hour by one machine. They are straightened cold and bored with corresponding speed, and even the rifling is now done automatically, so that one man tending six machines can turn out 60 or 70 barrels per day. With the old rifling machine 20 barrels was about the limit of a day's work; but the improved machines attend to everything after they are once started, and when the rifling is completed ring a bell to call the attention of the workman. He is thus enabled to attend as many as six machines at a time.

CAST-IRON PILLARS TABOOED.—The Berlin authorities having prohibited the use of cast-iron pillars in the underground rooms of dwellings, as being apt to crack in case of fire, and having ordered the use of wrought-iron pillars instead, led Professor Bauschinger to make some tests as to the qualities of each. He has found that under the influence of intense heat, wrought-iron pillars bend to such a degree as to be valueless as supports, while those of cast iron, under the same conditions, never ceased supporting the weight put upon them, and when cooled assumed very nearly their original position.

SMELTING OF IRON SAND.—A method by which the immense deposits of iron sand which abound on the coast of New Zealand can be successfully utilized, has lately been discovered at Auckland. The feature of the new process consists in uniting a quantity of scoria with the sand when put in the blast. This has the effect of preventing the iron from oxidizing, an obstacle that has heretofore never been successfully overcome in smelting iron sand.

## SCIENTIFIC PROGRESS.

## Telephonic Induction.

The extent to which telephonic induction may be carried is one of the remarkable discoveries of the day. Mr. Preece recently read a paper on the subject before the British Association, which has attracted much attention and has revealed a somewhat alarming extent of electrical induction. In Gray's Inn Road a telegraph wire suffered induction from a telegraph cable 80 feet below and in the ground. The complaints induced Mr. Preece to arrange experiments on a larger scale. In Newcastle, induction was noticeable at 3000 feet distance. Experiments on the Durham-Darlington lines and two other parallel lines, the one 10½ miles east, the other 5½ miles west, proved that on a Sunday, when all other traffic was stopped, a peculiar signal given on the central wires of 18 miles length could distinctly be heard at the four corners of the two other parallel wires, and, moreover, Morse signals were heard, which could only come from a line 40 miles away. Two other lines were therefore selected—one from Newcastle, 55 miles long, with 10 wires, the other from Gretna, 40 miles long, with 17 wires, the two being about parallel and 40 miles distant from one another. The wail produced by intermittent increasing and decreasing currents by means of a special commutator in the one line was sadly audible in the other.

Mr. Preece did not consider these tests conclusive evidence of induction, because earth was used as return lead, although the respective line terminals were most carefully insulated. Another series of experiments is, therefore, now being carried on, with gutta serena wires bent so as to form squares, of a side of ¼ mile length. Two such squares have been placed on the ground ¼ mile apart; and what is intrusted to a telephone inserted in the one closed circuit can be listened to in the other. If facts of this kind become known, the telephone will not gain in favor.

Cables are not much better, perhaps; signals given in the one cable to the Scilly islands have been heard in the other cable half a mile away. It is further intended to carry a special double line of copper wire to Wales. Professor Silvanus Thompson objected to the term induction, which has become the household explanation for a good many different troubles. As the earth was used in Mr. Preece's tests, and perfect insulation is a practical impossibility, the lines of force tapped at any two points must necessarily indicate current variations. Mr. Preece protested against having characterized the phenomena as induction phenomena. It was remarked that at the electrical tramway line at Giant's Causeway, a telegraph wire is only 25 feet from the conductor rail, and no induction effects have ever been complained of, although the postal authorities had to be satisfied about a great many points before agreeing to have the two lines so near one another. A test experiment was further suggested. Let us take three parallel wires, the one for the signals, the other two on the same side of the first for listening with the telephone at the one terminal; if we have to deal with conduction, it cannot make any difference whether or not we join the two other wires by auxiliary wires, so that they form one complete telephone circuit; if it is induction, a difference must result. There seems to be a wide field for research opened up in this direction, which, if properly followed up, as it no doubt will be, may lead to important results.

ICE RIVERS.—Ordinary glaciers are accumulations of ice descending along valleys from snow-covered elevations. They are ice streams, 200 to 5000 feet deep or more, fed by the snows and frozen mist of regions above the limit of perpetual frost. They stretch on 4000 to 7000 feet below the snow line, because they are so large that the heat of summer cannot melt them. Some of them reach down into open cultivated tracts, the extremities of the Grindewald and Chamouni glaciers, for instance, being found within a few hundred feet of the gardens and houses of the inhabitants of the valleys. The best known glaciers are those of the Alps—numbering 1150, as Prof. Heim has just ascertained, and covering a total area of more than 500 square miles—but important ones also occur in the Pyrenees, the mountains of Norway, Spitzbergen, Iceland, the Caucasus, the Himalayas, the southern extremity of the Andes, in Greenland, and on Antarctic lands. One of the Spitzbergen glaciers stretches 11 miles along the coast, and projects in icy cliffs 100 to 400 feet high. The great Humboldt glacier of Greenland, north of the 79th parallel, has a breadth of 45 miles at the foot, where it enters the sea. The glacier is but one of many in that icy land, in the interior of which, according to Nordenskjöld, one may pass over a vast ocean of ice and snow, 1200 miles long and 400 miles wide, without seeing a plant, a stone or a patch of earth.

A NEW USE FOR ELECTRICITY.—By means of electricity the most attractive leather surfaces are now completely imitated. The leather which it is destined to imitate is first well cleaned and coated with graphite, as in electroplating a smaller article. It is then placed in a copper bath, the tank of which is made large enough to easily receive a skin of any size. A powerful dynamo-electric machine furnishes the

current. The copper is deposited upon the coated surface of the hide to the thickness of one-sixteenth to one-eighth of an inch. The plate thus formed reproduces, but reversed, every mark and minute vein of the leather, so that a print taken from it is an exact copy of the original.

A NEW COAL/OIL BURNING WITH SPERM-FIRE TEST OF 480 DEGREES.—From the date when kerosene oil came into general use efforts have constantly been making to carry the manufacture of petroleum still further toward perfection. The desiderata have been for the purposes of illumination, a smokeless, odorless and non-explosive oil, or the equivalent of sperm oil, and, for the purpose of lubrication, an oil which shall have the qualities of stainlessness, durability or non-volatility. The problem thus presented, which so long seemed hopeless to chemists and other experts, says the *Boston Advertiser*, appears now to have been solved by Charles Tappan, of Salem. Laboratory experiments give full assurance that the new oil, which has not yet received a distinctive name, can be produced on a large scale at a cost not materially, if at all, greater than attends the manufacture of the corresponding oils now in use, and with a facility not less. The new oil, as used for illumination, ranks with sperm oil. Like that, it requires no chimney and burns best with the same sort of wick, that is, a loose wick moving easily in the tube or socket. It yields about the same amount of light as the best sperm oil, and, like that, is perfectly secure against explosion. For household use in hand lamps, for lighting street-cars and other railroad cars and for burning in portable stoves for cooking purposes, the new oil seems to be a decided improvement on the kerosene, and this in the three particulars of safety, absence of odor and economy. For, assuming the cost to be greater, it is certain not to equal the combined cost of the kerosene and its chimneys. For sleeping-car and oil-stove uses the gain is manifestly great in getting rid of odor and securing safety. The new oil, if spilled upon the floor of a car in case of collision, would be as safe against ignition as would sperm oil. In one point it seems to have a preference over sperm oil, namely, in less crusting of the wick.

THE SOUTHERN CALIFORNIA GEOLOGICAL SURVEY.—Mr. James Stevenson, the executive officer of the United States Geological Survey, has just returned to Washington from Southern California, where he has been for several weeks making some preliminary investigations regarding the character and resources of that portion of the State. The principal feature of his instructions was to ascertain the character of the climate and whether geological and topographical parties could work in Southern California during the entire year, and whether geological, topographical and other scientific researches were sufficiently important to warrant the establishment of such in the southern part of the State. The substance of Mr. Stevenson's report will be to urge the commencement of such work at once. He considers that portion of the Pacific Coast one of the most interesting and prosperous he has ever visited. He says that the recent introduction of the Atlantic & Pacific and the Atchison, Topeka & Santa Fe roads into San Diego has had a most marvelous influence. Thousands of people are now flocking to that coast, and the developments that have followed are unparalleled.

CRAYON PICTURES BY MACHINERY.—Not exactly chromos, nor lithographs, nor photoprinting, but the invention consists in throwing colors upon the surface in spray so fine and so perfectly that the sand blast for designing, etching and engraving is but an imperfect counterpart. As an example, a lady produced a portrait of Gen. Sheridan's bust life size, as handsome as anything in engraving or hand work, in an hour. It is claimed that these pictures, portraits, landscapes, etc., can be produced in this manner commercially profitable.

THE BOBOLINKS NORTH AND SOUTH.—There are likely to be some new views current in regard to the bobolink, if the ornithological reports from Washington are accepted. It is said that this little feathered glory costs the country between \$3,000,000 and \$4,000,000, that being the estimated damage he does to the rice crop in the Southern States. Part of the damage is in harm done to the crop, part in wages paid to large numbers of persons employed to protect the crop from the birds. In the North, on the contrary, he does no harm.

NOT NEW.—The use of sugar or a saccharine liquor for mixing lime and cements is not new. It has been known in some parts of the world from "time immemorial," and many of those whose business it is to make plaster molds or casts mix the plaster of paris with a solution of sugar in water. Attention is called to the fact that the practice of mixing jaggers or unrefined sugar with mortar is very ancient, and masonry properly cemented with such mortar is not easily removed without blasting.

LONG-DISTANCE INDUCTION.—According to W. H. Preece, the English electrician, the so-called induction sounds in telephone lines, caused by electric currents passing over other wires, have been produced in telephone lines not approaching nearer than 40 miles to the wire of the disturbing current.

## ENGINEERING NOTES.

## Progress in Electric Railways.

There are several electric railways in various parts of the world which have met with more or less success, but no one seems as yet to come up to that degree of practical success which will warrant anything like a general introduction of the system, even in street railways or others of short distances only. Electric propulsion is yet in its experimental stage.

There are several difficulties connected with all the various systems yet produced. It is conceded to be impossible to generate the electricity on the locomotive itself, hence in all systems the power is communicated to the car or train in something like the usual way of transmission. One of the most serious difficulties in the way is to have the conducting medium thoroughly insulated and at the same time in constant connection with the moving locomotive or car.

In the Siemens railway system the electricity is conducted by a third rail between the regular rail tracks, and the conducting rail is made massive so as to thus prevent accidents from any conductor casually coming in contact therewith, but still accidents of that kind do sometimes occur. The connection between the car and rail is maintained by metallic brushes. At Portrush, in Ireland, the rails themselves upon which the cars run are usually conductors. Overhead wires are also used as conductors, a moving carrier attached to the car being the medium of receiving the electricity from the wire.

Some very elaborate experiments have been for some time in progress upon one of the elevated railroads in New York City, but the expected success does not appear to have been as yet met with; very little information as to the progress made has been given to the public. But the experiments are still in progress, and much money and the best obtainable skill are being expended to perfect the same.

Some three or four months ago a series of experiments were initiated on the Ridge Avenue City Railroad, in Philadelphia. The progress of this experiment was made the subject of a paper recently read before the Franklin Institute of that city. It appears from that paper that the Ridge Avenue line differs from all preceding experiments in having its electric conductors in an underground circuit, presumably much after the manner of the cable system first devised in this city, from whence a collector passes from the car to the cable through a slot in the conduit, the connection being made in a manner similar to the grip in the cable cars. By this means there is no risk of danger from contact with the electric conductor; while all parts are compact and convenient. The electricity is conducted by ordinary wires from the dynamo to the conduit.

The collector consists of two firm steel springs, shaped somewhat like carriage springs, whose extremities press upon the channeled iron conductor. The position of the collectors may be readily changed to conform to the desired motion of the car, either forward or backward.

One of the chief difficulties with electric locomotives has been the difficulty and danger of intrusting the delicate and easily-disturbed mechanism of an electric motor to unskilled hands, such as must be trusted to run a street car.

The inventor of the Philadelphia system has, in a great measure, avoided this difficulty by providing a switch-board, entirely inclosed, and in which a single motion of a lever causes the motor to move forward or backward or remain stationary, and regulates the speed at which it shall run.

The working of the system, it was stated in the paper referred to, appeared to be all that could be desired. The road has several quite short curves, as well as several steep inclines. Each of these difficulties is readily overcome with a 7100-pound car and a fair complement of passengers. While the car is in motion the volt meter shows a constant pressure of about 100 volts, the ampere meter varying with the load from 5 to 25 amperes.

**THE PROPOSED FRENCH TOWER.**—The tower 1000 feet high, which it is proposed shall be erected in Paris for the Exposition of 1889, is likely to afford plenty of excitement to the Parisians before it is completed. The first step is about to be taken in ascertaining what curve should be given to its sides. A chain or cord suspended between two points forms a catenary curve corresponding with the weight of the chain or cord. Now it is supposed that something of the kind occurs when the suspension is approximately vertical. The engineers have therefore arranged to cause a balloon to ascend to the height of the proposed tower. From the boat, ropes will be hung to the ground and fixed there. From their curvature, the contour of the tower will be derived. It is a novel experiment, but, as there is some difficulty in arranging the slope of an ordinary lighthouse, we cannot expect that a colossal tower, made of iron plates, is to be designed without much deliberation.

**THE SWEDEN-DENMARK TUNNEL** is still seriously talked of. The depth of water in the channel under which it is proposed to tunnel does not exceed 60 feet. The Swedish ports on the sound have only shallow water, and much difficulty arises in the shipment of goods.

## USEFUL INFORMATION.

**LEAD-EATING INSECTS.**—A French architectural journal recalls an observation made by Viollet-le-Duc that lead plates for roofing and other purposes are often pierced by insects. He accused the wasps of being the authors of the little holes that he found gnawed in lead roofs, but later observers have discovered that both worms and flies often drill through heavy plates. Some 25 years ago it was found that the lead bullets of cartridges that had been stored in wooden boxes were badly gnawed, and a number of gall or saw flies were found in the act of working upon them. Why these little creatures should amuse themselves in digging out the tough metal with their jaws it is hard to say. Both males and females were found at work; and the only suggestion which our Gallic cotemporary can make is that they were, perhaps, sharpening their teeth. The first notice of perforations made by worms seems to have been made by M. Janniard, formerly official architect in charge of churches and public buildings, who observed that the lead covering of the steps on the roof of an old house in Paris was bored through in several places. Only one of the steps was attacked; and, on looking closely, he found that every hole in the lead corresponded to a wormhole in the oak planking on which it was laid.

**INCREASING THE HARDNESS OF BRICKS.**—For obtaining products that will offer greater resistance to humidity, etc., than ordinarily is the case, an improved process of manufacturing bricks has been brought forward in Germany. After drying and grinding the clay a mixture is made of 91½ parts of the latter, 3 parts of iron filings, 2 of table salt, 1½ of potash and 2 of elder or willow-wood ashes. The whole is heated to a temperature varying from 3362° to 3632° F. At the end of from four to five hours the argillaceous mixture is run into molds, then rebaked in the ovens—always protected from the air—at a temperature of 842 to 932 degrees F. The product may be variously colored by adding to the above quantity two parts of manganese for a violet brown, one part of manganese for a violet, one part of copper ashes for a green, one part arseniate of cobalt for a blue, two parts of antimony for yellow, and one and one-half parts of arsenic and one part of oxide of tin for white.

**COLD WATER PAINTS.**—A series of paints, which are made ready for use simply by the addition of cold water, have for some time past been successfully introduced abroad, the paint thus produced drying, it is stated, with a fine, hard surface, which, although mixed only with water, is impervious to rain and uninjured by frequent washings, even with diluted disinfectants; as oil and turpentine are also dispensed with, these paints have the additional advantage of being free from objectionable smell. They can be used for exterior work on wood as well as on brick, plaster, iron or stone, and for interiors they are of course peculiarly applicable. The paint can likewise be reduced by oil, which produces a hard and glossy surface. It is thought that non-poisonous and washable paints will prove of peculiar adaptation for tropical countries generally, where cleanliness and freedom from infection are particularly requisite, but where, it is well known, the application of the ordinary oil paints and distempers is neglected.

**SAWDUST FOR CLEANSING GARMENTS.**—Mr. Scott proposes to cleanse garments by submitting them to a uniform friction produced by sawdust from hard wood, and in connection with benzine, naphtha, or analogous solvents. The garments impregnated with any of the above solvents are placed in a revolving apparatus along with sawdust of mahogany or any other suitable wood. By the employment of this wood-powder it is stated that an economy is effected of 25 to 27 per cent of the cleansing material employed, and it is stated besides that the brightness of the colors is not impaired. The principle is not altogether a new one, since dyed skins, or rather skins the wool or fur of which has been dyed, are very often exposed with sawdust in a revolving cask, not only to remove any adhering particle of color which may not have been fixed on the fiber, but to give at the same time a kind of finish by the gentle rubbing action.

**DETECTION OF LEAKS IN WATER MAINS.**—The microphone is now being used in Germany for the purpose of detecting loss of water through leakage in the town mains. The apparatus consists of a steel rod, which is placed upon the cock in the neighborhood of which the leak is suspected, and a microphone attached to the upper end of the rod. A dry battery and a telephone complete the equipment. No sound is heard in the telephone if the cocks are closed and no leak occurs; but a leak of even a few drops through a badly fitting cock causes sufficient vibration in the pipe to affect the microphone, and to give audible sounds in the telephone. At the recent meeting of gas and water engineers in Eisenach, it was stated that the apparatus is so simple to handle that, with a little practice, ordinary workmen are able to detect and localize any leak.

**WHAT MAKES VINEGAR SHARP.**—George Adams, in 1747, said that some people have imagined that the sharpness of vinegar is occasion-

ed by the eels striking their pointed tails against the tongue and palate; but it is very certain that the sourest vinegar has none of those eels, and that its pungency is entirely owing to the pointed figure of its salts, which float therein.

**A TON OF COAL.**—There is more in a heap of coal than a thoughtless person may discover. Besides gas, a ton of gas coal will yield 1500 pounds of coke, 20 gallons of ammonia water and 140 pounds of coal tar. Destructive distillation of the coal tar gives 69.6 pounds of pitch, 17 pounds of creosote, 14 pounds of heavy oils, 9.5 pounds of naphtha yellow, 6.3 pounds of naphthalene, 4.75 pounds of naphthol, 2.25 pounds of alizarin, 2.4 pounds of solvent naphtha, 1.5 pounds of phenol, 1.2 pounds of aurine, 1.1 pounds of aniline, 0.77 of a pound of toluidine, 0.46 of a pound of anthracene, and 0.9 of a pound of toluene. From the last-named substance is obtained the new product known as saccharine, which is 230 times as sweet as the best cane sugar.

**INCOMBUSTIBLE LAKE.**—At a late meeting of the Applied Science Exhibition, at Paris, M. J. A. Martin, of Paris, exhibited a pair of muslin curtains to which a flame was constantly applied without consuming them. The composition he employs for rendering paper, wool and textile inflammable is the following: Pure sulphate of ammonia, 80 parts; carbonate of ammonia, 25 parts; boracic acid, 30 parts; pure borax, 17 parts; starch, 20 parts; distilled or pure water, 1000 parts. The materials are dipped in this solution while hot, so as to be thoroughly impregnated, when they are dried and ironed as ordinary starch fabrics.

**NEW PROCESS FOR RENDERING PAPER INSENSIBLE TO THE ACTION OF WATER.**—A new process of rendering paper insensible to the action of water and atmospheric changes has been patented in France. A sheet of paper is covered on the wrong side with a thin layer of gutta percha, which is afterward spread with paper, linen, thin pasteboard or similar matter. The whole is heated and pressed. Under the influence of heat the gutta percha becomes softened and unites firmly the two surfaces between which it has been placed. This prepared paper is of special value in art work.

**SCARPALOGY.**—*La Graphologie*, a French journal, describes a new method of reading character, known as "scarpology." It consists in a study of the heels and soles of shoes. If these are worn down evenly, the wearer is a good business man, energetic and quick in decision; if the outer side is worn more than the inner, he is of an adventurous turn of mind. Weakness of character is indicated by a heel and sole worn most on the inner side. An interesting paper might be written on the different methods adopted to test character.

## GOOD HEALTH.

## Insanity in California.

We have received the 34th annual report of the superintendent of the Stockton Insane Asylum, in which we find some interesting facts in regard to insanity in this State, as compared with that disease in other communities. We copy as follows:

Has our State more than its share of insane? There is a prevailing impression that mental disease is spreading among us at an unusual rate; indeed, I have heard the phenomenon explained on climatic and atmospheric as well as other grounds. A few considerations may here be presented to show that this impeachment of the mental stability of our people is unfounded.

First, let it be remembered that the aggregate number of the insane must ever be on the increase in any prosperous, growing community. So plainly is this so that the demand for additional asylum accommodation may generally be taken as an index of the advancement of a State, and a proof of its material and social development. But the repetition of these demands, with the frequent attraction of public attention to the subject, conveys to some the belief that insanity is inordinately active here. California, absorbing a large immigration yearly, yet with capabilities for great future numerical expansion, must expect to be called on to erect a new asylum every nine or ten years for perhaps the next half century.

No definite conclusion as to the prevalence of insanity in a community can be reached except on the basis of population. But what is the present population of California? The Federal census of 1880 placed it at 864,686. A comparison of this with former censuses fortifies the claim upon which most estimates of our numbers are now made, namely, that the State has for many years been steadily increasing at the rate of 100,000 every three years. Accepting this count as probably near the truth, the present population would be something over a million.

On this basis the proportion of insane here is not in excess of that of many other States. There are now 2922 inmates in our asylums, which gives us 1 to every 360 inhabitants. The ratio in New York is 1 in 365; in Massachusetts, 1 in 350; in Australia, 1 in 375; in Great Britain, 1 in 345; in France, 1 in 400; in United States, 1 in 545, excluding idiots, 1 in 300, including idiots.

Again, there is a gradual decrease in the

number of persons annually sent to the asylum, in proportion to the population. The number of those attacked with insanity is proportionately less now than it was three years ago, and three years ago it was less than it was six years ago. This progressive diminution in the ratio of those committed proves in the clearest manner the steady decline of insanity in our midst.

While, therefore, it cannot be said that California has a higher insanity rate than ordinary, there are certain peculiar and incidental conditions that tend to keep the rate higher than it would otherwise be. Foremost among them is our unusually large foreign-born population.

It is well known that Europeans coming to this country are much more subject to mental disorder than our native-born citizens. The reasons for this are various. The shock of separation and transplantation, the uprooting of old associations and habits of life, the homesickness, the inability in those who have hitherto always lived in the vicinity where they were born, to adapt themselves and find mental anchorage in new phases of existence—these are some of the explanations that have been offered. The fact was placed in a startling light by the census of 1880. It was found that while one-seventh of the whole population were foreign, of the insane, not one-seventh, as might have been expected, but one-third, were of foreign birth. Thus it appeared that while but one in every 662 of the native population was insane, the ratio among the foreign-born was one in every 250.

Turning to our own State, we find this significant showing repeated and intensified. No State in the Union has so large a proportion of foreign-born, except the neighboring State of Nevada. Over a third of the population of California, in 1880, were born outside of the United States. The number returned as insane in that year was 2503, of whom 1618, or two-thirds, were of foreign nativity. That is to say, one-third of our population (the foreign-born) produced two-thirds of our insane. Or, stated in another form, while one in every 646 of our native-born is insane, the ratio among our foreign-born is one in every 180. Giving these remarkable figures their weight, it will be seen that a low rate of insanity in our State would, under present circumstances, be akin to a miracle.

Another point closely affecting our insanity statistics may be found in the wide scope formerly embraced in the peopling of this asylum. Founded in 1850, it was for many years the only receptacle for the insane on the Pacific Slope. In the absence of other places for their reception, the insane of the Territories north and east of us naturally gravitated to Stockton, where they are to be found, many of them, to this day. They help to swell the large class of chronic insane who have accumulated in our wards, and who, carried on our books from year to year, contribute toward giving a wrong impression as to the prevalence of acute insanity in the State.

Idiocy, etc., in California.

Another fact should be considered in this connection. While in other States, imbeciles, dotards, simpletons, fools, etc., are kept in separate institutions, here they are all consigned to the insane asylums and counted in the reports as insane—another source of error into which many, not acquainted with the facts, naturally fall. When these classes of patients are separated, the statistics show that our proportion of idiots, etc., is far below that of other States, but the exact figures are not given in the report before us.

## The Increase of Bald Heads.

To a person who has a moderately well-supplied pocket-book and a thoughtful turn of mind, there can be no more fruitful theme for meditation than to go into our large halls, theaters, churches and other places of public resort, and, securing a seat in the gallery or in the rear part of the room, look at the heads of the audience, for no other purpose than to ascertain by actual count how many show signs of baldness. Unless the experimenter has been in the habit of counting for this object, he will be surprised to learn that in most of the Eastern cities fully 30 per cent of the men over 30 years of age show unmistakable signs of baldness, while nearly 20 per cent have spots on their heads that are not only bald but actually polished with the gloss that is supposed to belong to extreme old age alone. From my observation I find that bald-headed men are most plentiful in New York and Boston. After these come Philadelphia, Washington and the Western towns. I say "men" for two reasons: 1. Because women usually wear their hats or bonnets on such occasions, thus covering their crowns. 2. In case their hats are removed the hair is combed up so as to cover any possible bald spot, or else there is an artificial "switch" to hide the defects of nature. So, without indulging in any speculations regarding what may be, I will confine myself to what is to be seen.

Here are a few observations taken in Boston: Trinity church, 243 men; 71 actually bald, 46 indications of baldness. King's chapel, 86 men; 38 actually bald, 14 indications of baldness. Hollis Street theater, orchestra at performance of the "Mikado," 63 men; 27 actually bald, 10 indications. Boston theater—Jude, 126 men; 51 actually bald, 43 indications.—*Virgil G. Eaton, in Popular Science Monthly.*

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**SUTTER CREEK.**—Amador Ledger, Dec. 3: Thirty stamps of the Mahoney mill are in constant motion. The ore that is being crushed is reported to be paying very well. The South Spring Hill Co. has attached a water-power whistle to its mill. It is working satisfactorily, and is conceded to be the noisiest blower in the neighborhood.

**PLYMOUTH.**—Mining operations are taking a boom. Active preparations are being made by the Plymouth Consolidated to enlarge the Pacific mill by an addition of 40 stamps. Already they have commenced to excavate rock for the foundation. The New London Co. is still pushing ahead vigorously, having just completed fine hoisting works, and every one is predicting a splendid mine.

**VALPARAISO.**—This mine is situated near Middle Bar, and joins the Mammoth on the north. It is owned by Onocchio Bros., of Jackson. For some months past a few men have been employed in running a drift south, in the direction of the point where the rich deposit of gold-bearing black metal was discovered in the Mammoth ground. Recently they encountered a body of quartz, abounding in that peculiar "black metal" which has already made this district famous. It evidently carries a large percentage of gold. The miners are working by contract, having to run the tunnel a certain distance for a stipulated interest in the mine.

**MISCELLANEOUS.**—The Mellow Bros. have encountered a 4-foot ledge in their quartz claim, near Butte City. Samples of the ore which we have seen show plentifully in free gold, and the owners are confident that they have struck it rich at last. The Mellow gravel claim is being prepared for active operations this winter. Four hundred and seventy feet of 15-inch and 500 feet of 11-inch pipe has been placed in position, and a giant has been procured.

## Calaveras.

**FROM MURPHEYS.**—Cor. Calaveras Prospect, Dec. 3: The mercury in the mining thermometer is at a point above fever heat in this vicinity, and bids fair to rival in intensity anything ever inaugurated here. If the mining enterprises proposed here are carried out it will cause a boom such as was never known. The sale of the Moffitt & Barnes Gravel mine, in Balaklava hill, has been consummated and the purchasers will proceed to further develop the mine at once. The Vallecito Gravel mine owned by Mrs. Mitchell is said to have been sold. A party of mining men, who were here on the 26th of last month, examined the gravel diggings of Douglas Flat, Central Hill (Murphey's) and others in proximity, with the view of purchasing the entire area for mining. The conception is gigantic, and if carried out would bring wealth to both the coffers of the investors and our people in general. The proposition is to form a company and purchase the untouched acres of auriferous gravel in this locality, with the acres of surface gravel known to contain gold in remunerative quantities, and other adjacent mining property, including privileges, dumps, water courses, etc. There is a quiet movement in seeking mining property here pregnant with good results. A party has purchased a number of mining claims in connection with the Rogers ranch, two miles north of this place, and are about placing in position a Hurdy to run the arastras. The outlook is favorable for speedy development and a paying run. Work in the Oro Plata mine is progressing favorably and in a short time the management propose to increase their help. When the mill starts up we look for excellent results.

## El Dorado.

**EL DORADO.**—Cor. Republican, Dec. 4: The mining outlook in this vicinity is good, but we do not expect any great boom before spring. The Springfield is still running on rich ore. It employs about 30 men. The old El Dorado, which lies just north of the Springfield, is now being prospected with good results. We expect, in the spring, to see a large mill running on this claim. This mine now employs 12 men, and as opened up, it will employ a greater number. The McNulty mine, south of the Springfield, is now being prospected. About 15 men are employed in the mine and grading off a site for hoisting works. When the works are up, the old shaft will be cleaned out, and the mine thoroughly prospected. This mine pays its men, who work above ground, \$2 per day. A few weeks ago, most of the men working at this mine made a strike for an increase of 50 cents per day. The superintendent discharged the strikers, and filled their places with new men. The Starlight mine, which is situated west of Logtown, is running day and night, and is reported to be paying well. This mine employs from 25 to 30 men. We are informed that the Red Rover mine, near Logtown, will start up soon. When spring opens we expect that work will be resumed on many of the old mines in this vicinity, and old El Dorado will again be prosperous as of yore.

**QUARTZ.**—Placerville Observer, Dec. 4: Rich quartz is becoming a very common thing here as well as in Grass Valley. One Gabriel Beieria was in town last week exhibiting ore literally "lousy" with the bright and shining metal. The ore was taken from a ledge on Mathenas creek, two miles below the Springfield, which in itself is proof positive that this wonderful mining district is still in its infancy. Through an interpreter we were informed that the ledge is now four feet in width and contains rock that will readily mill \$1000 per ton.

## Inyo.

**MARBLE.**—Cor. Ter. Enterprise, Dec. 7: Steam was turned on the engine at the new mill of the Inyo Marble Co. on Thursday last. All the machinery is in good working order. The mill will not go into full operation until the superintendent, M. Luce, returns from San Francisco. He is making preparations for increasing the capacity of the mill. He will add a new set of gang saws to the one set now in the mill. Each gang will hold 40 saws and will saw 40 slabs of marble at once. A rubbing bed is attached, used for smoothing the slabs as they come from the saws.

## Mariposa.

**COULTERVILLE.**—Cor. Mariposa Gazette, Dec. 3: There is but little interest taken in the development of new mines. The only move that has been made in that direction for a long time is the purchase of the Crown Lead property by a San Francisco company. The company has repaired the dam so as to secure it against the winter and spring freshets. Its object is to convey the water in pipe or flume to Horseshoe Bend, so as to cover all the deep gravel diggings on both sides of the river and including Horseshoe Bend. The Red Cloud mine is still whacking away, turning out the bullion in large bars. The Banderita mine is still running.

## Nevada.

**PRESCOTT HILL MINE.**—Foothill Tidings, Dec. 2: The Prescott Hill mine is showing up in the best kind of way. The company (the Orleans) now has over 300 feet of backs, and in the north drift there is four feet between the walls, and nearly all of that is ledge. The Orleans people have a just reason to feel good, for they are almost certain to reap a rich reward for their long and hard labor.

**THE BRUNSWICK MINE.**—Articles of incorporation for the Brunswick Mining Co. have been prepared and it is cheering to think that the mine will soon start up. The Brunswick (old O'Connor or East Eureka) is in a rich district, and some of the very best kind of ore has been taken from the mine. There has been comparatively little work done on the Brunswick; but it has been demonstrated beyond a doubt that a good paying mine can be made there. The company is a strong one, and when the mine starts up it will be under the management of Mr. Geo. Fletcher, whose reputation for economy and judgment in management is too well known to be commented upon here. It is but reasonable to suppose that the Brunswick is an extension of the famous Idaho or Eureka lode.

**THE ROYAL METAL.**—Transcript, Dec. 4: About \$5000 worth of gold bars were holding down the bullion table at the Citizens' Bank yesterday. This is not mentioned because it is anything unusual, but simply to show that the quartz and drift mines around here are keeping up their lick in the matter of productiveness.

**GOLD OR AGATE.**—Nevada City Herald, Dec. 4: The discovery of rich deposits of gold in connection with agate ledges is a surprise to prospectors and miners. Yesterday we made mention of the rich strike made by the colored man, Geo. Joseph. We have since learned that others have been prospecting on the same ledge, and that the whole formation, including the genuine moss agate, carries gold. A species of granular quartz, underlying or overlying the agate ledge, gives assays running to \$17.50 per ton and the agate itself assays \$11 per ton. We have not seen the assays made, but have been informed by the parties claiming to have had them made by competent assayers. The deposit in question crosses the ridge between Deer creek and Rush creek, about one-half a mile west of the Indian Flat schoolhouse. In some places it crops out to considerable width, and the existence of iron in large quantities is everywhere manifest. On the surface the vein matter consists of moss agate and layers of granular quartz. Frequently feldspathic veins are found inclosed between the walls of the main deposit. Where the pockets have been found, the bedrock is soft and the vein matter decomposed resembling an ashy paste. The gold is found free, but frequently iron pyrites not oxidized is found in connection with it. At Rush creek, the vein runs into white quartz which continues northward to the Yuba. But from Rush creek south it has the character of an agate deposit, and no one heretofore has thought of looking for gold in it. This singular deposit, during the wearing away of the surface and the formation of soil, has furnished immense quantities of free gold. At the locality described, Rush creek was the richest surface diggings ever found in this district. What may be developed in this strange but rich mineral deposit, by the patient work of the prospector, remains to be seen, but certain it is that millions lie buried there.

**DIVIDEND 206.**—Foothill Tidings, Dec. 7: Yesterday afternoon at the office of the secretary, the directors of the Idaho Mining Company held their regular monthly meeting, and at this meeting declared dividend No. 206. We do not believe that mine will ever quit paying dividends, not at least for years to come.

**THE NORTH STAR MILL.**—One of the finest mills on the continent is now going up at the North Star mine, and is under the general direction of Mr. W. C. D. Body. The granite walls, battery blocks, roofing, etc., are complete, and it will be but a short time before the batteries, stamps, concentrators and all the inside workings of the mill will be in running order. The work has been done quickly and in first-class manner.

## Placer.

**IOWA HILL.**—Placer Republican, Dec. 4: J. B. Hobson has effected a sale of the Lion quartz mine, near Damascus, to a San Francisco capitalist for \$20,000 cash. In the Morning Star mine, since the upraise was completed, the air is good and the contractor will have the bedrock tunnel completed about the 1st of January.

## Plumas.

**GRANITE BASIN.**—Cor. Plumas National, Dec. 4: See & Jolly are now turning their attention to the mine, where they have struck the chimney in the lower tunnel on the Specimen, which will furnish work for men and teams when spring opens, to deliver the ore at the mill. Swan & Williams are at work on the old Homestake, taking out splendid milling ore. They have their mill filled with rock, which they will crush during the winter. Rockefeller & Co., the enterprising miners of the Basin, have placed one of Patten's concentrators in their mill which will make the rock yield a greater amount of the precious metal. They will run the mill night and day from now on. Mr. A. Christie has taken a number of tons of rock out since he finished his crushing that will at least go \$50 per ton. Next is the Morning Star mine, under the temporary management of Geo. Hurst, during Mr. Mankey's business trip below. The mine is yielding a fair dividend to its owners.

## San Bernardino.

**BONANZA HILL.**—Calico Print, Dec. 4: The interest manifested in the operations on Bonanza hill has assumed a different complexion from the excitement caused by hearing of frequent and rich

strikes of ore deposits by the lucky lessees. The property-owners of a large portion of the town, from like Noel's to the upper end of the main street, are manifesting a personal as well as anxious interest in the contest between the two parties claiming the property under the different names of Silver Monument and Jennie Lind. It is rumored about town that the Jennie Lind Company are preparing to make applications for a patent, and should they succeed in getting it, the property of about one-half of the town would belong to that company; but it is thought that the protests will be so numerous and strong that the parties who may be adjudged by the courts as the lawful owners of the property in dispute will fail to get a patent. Before there will be any existing cause for anxiety it will have to be settled in regard to the title which at present stands in about this shape: D. M. Harwood claims that he located the ground before the Jennie Lind locators did, but recorded it a day or two afterward. The prospects of lively and interesting litigations between the present claimants to the mining property and the numerous residents on the same and the lucky owners is quite promising.

**OLD BALDY PLACER MINING.**—John E. McCallum is in the city from the Old Baldy country. He has been engaged in placer mining on the Golden Eagle, situated on the dividing ridge between Old Baldy and Telegraph hill. He is in the firm of J. H. Benson & Co. They have been building a chute and reservoir which they have just finished. Next spring when the snows go and the swallows come, they will build a tramway of 400 feet in length. Their mine embraces 13 acres of gold-bearing surface. Even packing the dirt at great disadvantages large returns were obtained, which will be immensely enhanced when the dirt can be worked upon the ground. The "pay dirt" extends upward about seven feet from the bedrock and is very rich. Undoubtedly the gentlemen of this company have a very valuable mine, and one which, in the early future, will be a fortune to its owners. They deserve their good fortune because it is due to their industry and persistent enterprise.

## Shasta.

**NOTES.**—Republican Free Press, Dec. 4: Barney Conroy says that a depth of 360 feet on the Balaklava mine shows a large body of rich ore. L. J. Fader transported the old revolving furnaces at Copper City to Iron Mountain this week, which will be used by Magee, Camden & Co., in working the ore of their mine. Charley Butterfield has accepted a contract to haul 1000 tons of ore from the Flanagan mine, Old Diggings, now owned by Paul & Garlick, to their mill at the mouth of Spring creek. Jack Conant was exhibiting this week a fine specimen of gold quartz. The gold could easily be seen, but, unlike in most specimens, appearing in tiny specks and streaks, it was imbedded in the quartz in blotches as large as peas. This specimen came from a tunnel about 300 feet from the surface. Jack will have his 10-stamp mill in operation by January. Mr. Robt. Skinner was in town yesterday, and says that the works at Lower Springs are progressing as rapidly as the workmen can push things. It is expected that the mill and furnace will be in operation by the 15th of January. The firm has between 300 and 400 tons of ore on the dump, which will be taken in hand as soon as the works are completed. The ore is expected to yield from \$30 to \$60 per ton. Mr. Skinner says that the Lower Springs district is overrun with prospectors, some of whom have discovered some very promising leads. Further developments may prove this district to be one of the richest in the State.

**MILL.**—Shasta Courier, Dec. 4: The Fife mill, at Spring Creek, will prove a great boon to quartz miners in that vicinity, as it will enable them to prove their ledges by genuine working test, the only test that is worth a continental.

## Sierra.

**BALD MOUNTAIN EXTENSION.**—North San Juan Times, Dec. 4: E. K. Downer, of the Mountain Messenger, passed through this place en route for Sacramento Thursday. He gave us the following intelligence connected with the Bald Mountain Extension mine at Forest City. The company has now 84 men, and employs others as fast as required. Walter Lawry is superintendent of the mine. The receipts of the mine in the month of September were \$5040; in October, \$6000; November, about \$5000. Every inch of gravel taken from the mine contains gold. The main tunnel is 8213 feet in length. A blower is connected with the tunnel which supplies eight cubic feet of air per minute. Large dividends are anticipated in the near future.

**THAT NUGGET.**—Sierra Tribune, Dec. 4: The S. F. Examiner some time ago gave an interesting description of Stellman & Hayes' \$6000 nugget, but failed to relate the circumstances under which it was found. It occurred in this way: John Mackey, not of bonanza fame but of Stellman & Hayes' gravel claim, was removing boulders and rocks from the diggings when he espied under a clump of trees what he supposed was a good-sized boulder. It was deeply imbedded in the earth. Mr. Mackey, with several vigorous thrusts of his pick, succeeded in removing it from its position. He was about to dispose of it, as he had disposed of other boulders, viz., cast it into the river, when his attention was attracted to gobs of gold hanging from its sides. The nugget when found was literally covered with mud and clay, and it was only where the pick had struck it that the gold was exposed to view.

**PERRY CON. MINE.**—This mine lies about one-half a mile southeast of Sierra City and is owned by Joe Perry, John Henderson, Henry Knuthson and others. The tunnel is in 473 feet on the course of the vein. A contract has been let to run 100 additional feet. The ledge runs in a northwesterly and southeasterly direction, and is supposed by many to be a continuation of the Sierra Buttes ledge. Excellent water and wood privileges exist at the mine. The owners expect to erect a quartz mill next year.

**YOUNG AMERICA MINE.**—A mine pump has been purchased for the Young America mine, and will be used for pumping water from the upper lake to the mill. If the pump works satisfactorily the recently laid-off employes will immediately resume work at the mine. It is expected here to-day. Twelve men are now engaged in building a wagon road from the flume to the dam. President Busch states that the pump will be in running order by Monday.

**JEFFERSONIAN.**—This mine lies in the Sierra City mining district and is within a short distance of the

Young America. Two tunnels have been run. At the upper one, which is in 125 feet, a well-defined 3-foot ledge has been struck. The mine is under the management of the Jeffersonian Mining Co., a corporation with A. C. Busch as its president. Extensive developments will be made at the mine next spring.

**JIM CROW MINE.**—This mine is situated at the head of Jim Crow Canyon, about six miles southwest of Sierra City. A tunnel has been run 150 feet in length. The ledge varies from 5 to 12 feet in width. There is a raise on the vein from the end of tunnel to surface, a distance of 80 feet. The vein in the raise contains ore which will mill from \$6 to \$12 a ton. An improved Forbes mill is at the mine and works to perfection.

**HOG CANYON MINE.**—This mine is situated between Hog canyon and Whitney's mill, and is owned principally by D. L. Whitney & Co. The tunnel is in about 100 feet. There is a well-defined ledge 4½ feet wide and which prospects from \$15 to \$20 a ton. A 10-stamp mill will be erected in the spring.

**GOLD BLUFF.**—This well-known mine, situated about a mile from Downieville, is again being extensively worked. The lower tunnel is now in about 250 feet. Indications show that the ledge will soon be reached. Operations were first commenced here in 1853. A. Van Slyke is the present owner of the mine.

## Siskiyou.

**SCOTT RIVER.**—Yreka Union, Dec. 4: The Quartz Hill Co. is running its new mill with success. Campbell & Small are starting a tunnel on the Clay hill, two miles above Scott Bar. Peter Hansen is doing well at present in his claim on Skunk hill. Magoffey & Ingrin are still working their claim at Scott Bar. Bennet & Co. are still working away with success.

## Trinity.

**YET TO COME.**—Trinity Journal, Dec. 4: The season, as it is called in miner's parlance, is yet to come. Up to the present date, Dec. 3d, only 4.02 inches of rain have fallen since July 1st. A year ago considerable sluicing had been done prior to this time. It ought to storm long and well when it gets at it, but at the present there are no indications of even a beginning.

## NEVADA.

## Washoe District.

**CON. CALIFORNIA AND VIRGINIA.**—Enterprise, Dec. 4: The daily yield continues to be about 400 tons, shipped to the Morgan and Eureka mills, on the Carson river, for reduction. The assays from mill battery samples average about \$45 per ton. The new ore development shows greater size and quantity as further explored by winzes and drifts, and the average quality is very good, as evidenced by the bullion yield. Its extent is as yet unknown and undefined, but it is stated to show \$10,000,000 now opened out, ready for extraction. This, however, is unofficial, yet probably not very far out of the way. Whether it extends north and south into Ophir and Best and Belcher remains to be found out by practical explorations, yet both mines are very hopeful of a slice of the bonanza. 1650 Level—The south-west drift from the C. and C. shaft has a total length of 562 feet, 17 feet having been added during the week. The upraise from the east crosscut continues in good ore, and is being carried up directly beneath the good ore development on the levels above. 1600 Level—The drift running north from the north end of the mine was extended 50 feet, making a total of 450 feet. 1500 Level—The drift running north from the old Consolidated Virginia shaft is 265 feet in length, 54 feet having been added during the week. 1435 Level—A station has been cut out for a winze which is to be sunk to the 1550 level. 1300 Level—The drift running north from the station of the old Con. Virginia shaft is 420 feet, 52 feet having been added during the week. Some of the best ore of the new bonanza is found by this drift, the full extent and value of which is not yet defined. Some of it is of very high grade.

**SAVAGE.**—On the 500 level west crosscut No. 1 from the main south lateral drift shows good ore, the extent of which is not yet defined. On the 600 level the main south lateral drift is being steadily driven to connect with the main Savage shaft. The desired connection will be made in about a week or 10 days. A large double compartment winze is being sunk below the floor of this drift. It is now down 15 feet in excellent ore. On the 800 level the main south lateral drift is being steadily driven to its desired connection with the Savage shaft. This will be accomplished shortly, and crosscutting commenced westward into the body of ore on that level. On the 1640 or Suro tunnel level, where the incline intersects the tunnel, the ground is much caved, necessitating considerable repairs. Some very good ore exists at this point, and it has to be extracted.

**POTOSI.**—The southeast drift from the Chollar line, on the 250 or old Potosi tunnel level, shows about 80 feet in length of good ore, 25 feet in width. A station is being cut out for a winze, to be sunk below the floor of this drift, following the ore body to define its depth. The Lindsay drift, about 300 feet south of the Chollar line, shows 95 feet of good ore, and crosscuts are to be made to determine its width. A chamber is also being cut out for a winze, to be sunk below the floor of this drift, in the strongest portion of the ore vein, in order to ascertain how well it holds out in that direction. The above winzes will hereafter be known as the north and south winzes.

**HALE AND NORCROSS.**—The main vertical shaft has been repaired and put in complete order to the 1300 level, and the main incline from that point has been partially repaired to the 1640 or Suro Tunnel connection. The old second station has been reopened and repaired and a west drift extended therefrom 40 feet. The seventh station has also been reopened and a drift run west from it a distance of 25 feet. On the 1300 level (8th station), the southeast drift has been reopened, timbered and extended 60 feet.

**BEST AND BELCHER.**—600 Level—East crosscut No. 2 is in about 100 feet. Face is vein porphyry. East crosscut No. 2, which is 90 feet further north, is 645 feet in length, running in vein porphyry. 800 Level—The cross drift east from the end of the main north lateral drift at the boundary line between this and the Consolidated California and Virginia

mine has been advanced 39 feet, making a total of 77 feet. Material, porphyry, clay and quartz.

**ALTA.**—On the 725 level the north and south lateral drifts in Lady Washington and Benton ground, following along the Keystone vein, continue in vein matter carrying streaks and bunches of ore. The winze sunk below west crosscut No. 2 in the main Alta vein is now down 125 feet. The small seepage of water coming in at the bottom gives no trouble.

**ANDES.**—On the 330 level the main west drift was found to be in need of much repairing. This has been done to the distance of 50 feet from the shaft, and beyond that point it is thought to be in better condition, requiring less repairing. This drift is about 600 feet in length.

**GOULD AND CURRY.**—On the 425 level cleaning out and retimbering the old south lateral drift from the main west drift progresses well, as usual. The face is now in vein porphyry, clay and quartz. The surface hoisting machinery is being put in good working condition, and repairs to the main shaft are about being commenced.

**CHOLLAR.**—The cleaning out and repairing of the old shaft progresses well. It has been repaired to the depth of 350 feet. The strong flow of surface water at the 250 level, mentioned in last Saturday's report, is draining out and will soon give little or no trouble. No news of interest in any other part of the mine.

**BULLION.**—A donkey engine, with a good house over it, has been placed at the old Cross shaft, and the shaft cleaned out and repaired to the depth of 100 feet. Good ore results are anticipated from this working at the north end of the mine.

**QUINN MINE.**—Work will be resumed in the old Quinn mine, below Silver City, next Monday, with two shifts of 10 men each. The retimbering of the main shaft will be first in order, and two carloads of timber are already ordered for the purpose.

**YELLOW JACKET.**—Daily output, 150 tons of low-grade ore, from the 1300 level and other levels above. Good work continues to be done reopening the lateral drift north on the 1400 level.

**OVERMAN.**—At the old shaft of the mine the hoisting machinery, etc., is being overhauled and put in order for the resumption of work in the old upper levels.

**OCCIDENTAL.**—A few tons of low-grade ore are being taken from the upper tunnel for milling. The upraise to crosscut with the upper tunnel is still in very hard quartz.

**OPHIR.**—On the 1065 level a shaft station is being chambered out. About 300 tons of ore per day is being hoisted for the Consolidated California and Virginia Co.

**IMPERIAL.**—The statement that work is soon to be resumed in this mine, using the main hoisting works for this purpose, is denied by official authority.

**JUSTICE.**—Running the drift from the old Woodville shaft into the southern portion of the mine still progresses in low-grade ore.

**ALPHA AND EXCHEQUER.**—The grading and placing of the surface hoisting works at the old Alpha shaft goes steadily ahead, seven men being employed.

**CROWN POINT AND BELCHER.**—Daily yield, about 375 tons, principally from the 1600 and 1700 levels, supplying the Vivian, Santiago and Mexican mills.

**MONTE CRISTO.**—The progress of the upraise above the 150 level from the new shaft continues slow, the rock being very hard.

**UNION AND MEXICAN.**—On the 1300 level the joint north lateral drift is making good advancement; also, the crosscut east from it.

**UTAH.**—On the 472 level the main west drift is out about 445 feet, with the face in heavy clay, porphyry and quartz.

**KENTUCK.**—About 60 tons continue to be the daily output of low-grade ore, from the 800 level principally.

**NORTH GOULD AND CURRY.**—Two shifts of men are working night and day sinking the shaft.

#### Garfield District.

**A SMALL LEDGE.**—Virginia *Enterprise*, Dec. 4: B. McClane, owner of the Honest John, an extension of the Lotta mine in Garfield district, while doing the necessary assessment or holding work recently, uncovered a small ledge of 20000 ore which he is extracting for shipment.

**REOPENING THE LOTTA.**—Walker Lake *Bulletin*, Dec. 1: Brooks McClane and Harry Somerville have taken a lease of Fairmont property in Garfield, and will begin work immediately. This property includes the Lotta mine, where the first work will be done. Some years ago the richest rock ever mined in Garfield district was taken from this mine, and the present lessees are confident they can find continuation of the ledge, and uncover another rich body of ore.

#### Gold Mountain District.

**ORE.**—Virginia *Enterprise*, Dec. 4: Thirteen tons of ore from the Gladstone mine, Lone mountain, has been brought to the Reno reduction works.

#### Lone Mountain District.

**MILL.**—Virginia *Enterprise*, Dec. 4: At Gold mountain, Gay Thorpe has commenced the construction of a mill for his mine; several carloads of machinery and lumber having arrived on the ground.

#### Tuscarora District.

**BELLE ISLE.**—*Times-Review*, Dec. 3: Line crosscut west, 150-foot level, has been extended 18 feet. Line crosscut east, same level, has been advanced five feet.

**TORNADO CONSOLIDATED.**—We have extended tunnel 15 feet during the week, having had better breaking ground. Ledge in good quartz giving low assays.

**NAVJO.**—South drift from No. 5 crosscut, east vein, 350-foot level, has been extended a total distance of 81 feet. No. 1 winze on west vein, from east lateral vein has been sunk seven feet. On the 150-foot level, the north drift on east vein No. 2 has been advanced 10 feet; total length 67 feet. South drift on the old west vein, same level, advanced seven feet.

**NORTH BELLE ISLE.**—North gangway, 300-foot

level, extended 35 feet the past week. North drift, from No. 1 crosscut advanced nine feet; total length 54 feet. The usual quantity and grade of ore is being extracted in this drift. Nos. 2 and 3 winzes on this level continue to look well.

**NEVADA QUEEN.**—During the past week east crosscut No. 1 from the gangway, 150-foot level, has been extended 26 feet, the last eight feet being in vein matter, a portion of which is high-grade ore. No sign of the foot wall as yet. No. 1 shaft is down 109 feet, having been sunk 13 feet for the week. Water has increased some; rock continues hard. South drift from No. 2 shaft has been driven 10 feet; total length, 80 feet. Ore is not so wide, but is fine quality. Average grade of ore taken out during the week is over \$400.

#### ARIZONA.

**MOHAVE COUNTY.**—*Miner*, Dec. 4: Roe's team went out yesterday with a load of ore consigned to the Kingman Sampling Works. Ed. Thompson and Charley Kelley have shipped 40 tons of ore from the Rainbow mine last month. The pay-rolls of some of our mines for the month of November last were as follows: Oro Plata mine, \$2000; Rainbow mine, \$2000; Rural mine, \$1000. Tom Stinson has quit working on the Oro Plata mine, and has gone to work on one of his own bonanzas in the Todd basin. Messrs. Collins & Siedel left on Sunday afternoon for Hardyville, on the Colorado river, from whence they will proceed to the Rattan mine, in the San Francisco district if their grub holds out. Wm. Roe's and Wilson's teams took out a carload of ore last Sunday from Rural mine, owned by Messrs. Christie & Dunn. The ore was valued at \$20,000 or more. Who says that Mohave county mines are not coming to the front when their owners can make such shipments as these?

**CAVE CREEK.**—*Phoenix Gazette*, Dec. 1: From parties just in from Cave creek it is learned that a rich strike in the Phoenix mine is reported. The ore body is said to be 8 feet wide and of the same quality that the first millrun was made from that yielded \$73 per ton, free gold. In doing the assessment work on the Yellow Jacket mine a large vein was uncovered which upon being blasted into boulders were detached that would weigh from 100 to 200 pounds, showing free gold on every side, and upon being broken open they were literally honey-combed with that metal. The Chataqua showed almost as well. On Clam mountain the developments are rich. A gentleman recently took samples from those mines that assayed from \$4000 to \$5000 per ton. A later report says that a 20-stamp mill will be built on the mine in the next 80 days.

#### COLORADO.

**TISHOMINGO.**—*Georgetown Courier*, Dec. 4: The lode is being worked at the surface and through the Victoria tunnel by two sets of lessees, both of whom are taking out some ore.

**GETTYSBURG.**—Work has been resumed by Mr. Old on the tunnel back of Silver Plume. It is in nearly 200 feet and 120 remains yet to be driven to intersect the Gettysburg.

**ANGLO-SAXON EXTENSION.**—Morris & Edmunds have opened up four inches of ore in the heading of the adit, which mills two to two and one-half ozs. gold, 30 ozs. silver per ton, and 40 to 60 per cent lead. The adit is in 350 feet.

**BERTHA.**—Mr. O'Connell came down from the Bertha mine on Monday, with a millrun of ore that returned over 300 ounces in gold to the ton. The horseshoe leading to Gray's and Irwin's peaks promises to be one of our richest mining regions.

**CORRY CITY.**—The work of sinking and raising on the Corry City mine to connect the workings with the Diamond tunnel, is progressing as fast as the nature of the ground permits. The raise from the tunnel is in very hard rock and progress is slow. It is now 135 feet above the tunnel.

**MENDOTA.**—The last contract on the main shaft has been completed, and another is to be let. Tunnel level west has 100 feet yet to be driven to get under the shaft. Three stopes are being worked from this level, and each is in pay. Two stopes are in pay in the tunnel level east. About 35 men are employed.

**CENTENNIAL.**—This property now has a chance of becoming a large producer. The mine is well equipped with a hoisting plant which we are told is sufficient to do the work of sinking to the depth of 250 feet. The first and second levels, which are 50 and 100 feet from the surface, show for the distance of 80 feet in length, from two to six feet of concentrating ore running well in gold, silver and copper. The new ore body was discovered in sinking the shaft from the bottom of the second level. The ore body has increased in sinking 30 feet from 15 inches to three feet in width. This ore consists mainly of copper and iron pyrites, the former predominating, and nets about \$75 a ton. Every foot sunk so far on the new find has paid all expenses and left a nice surplus. In sinking a sump near the shaft two men in four shifts took out ore that netted \$350.

#### IDAHO.

**SAWTOOTH MINES.**—The Bidwell-Beaver mine is being worked by 14 men, who will continue under employment during the winter. The new hoisting works are completed and an incline shaft is being sunk. Supt. Venum is kept busily employed supervising the work, and proposes to have the property in fine working shape on the resumption of active work in the spring. The Silver King mine will keep 10 men at work during the winter. This property has given an excellent account of itself during the past season, having paid all expenses and a dividend to its Philadelphia owners. Supt. McHenry left his Eastern home some time ago, but proposes to return early in the spring and resume work on a more extensive scale than ever.

**MINE PURCHASES.**—Ketchum *Keystone*, Dec. 4: The bonding of the King of the West mine by Messrs. Haggin & Tevis, and its very probable sale to those parties before another month, is but the first of a number of purchases of Smoky property that will be consummated during the winter. The fine showing made by several of the mines of that district during the past summer has attracted the attention of many persons seeking mining investments, and next year the working of several mines in

Smoky will be commenced on an extensive scale. During the present week another sale was effected—that of the Mollie Bawn mine, which lies between the Silver Star and Carrie Leonard properties. The purchasers are J. M. Lamb, J. H. Huntton, A. L. Richardson and other gentlemen of Boise City, and it is their purpose to work the mine in a systematic manner. In addition to this sale another is on the tapis and will probably be consummated in another week. Wood River mines are to-day receiving more attention than ever before, both in the East and England, while mining properties of the adjoining districts are not being overlooked.

**WAGONTOWN.**—Owyhee *Avalanche*, Dec. 4: We hear that a good body of gold ore has been encountered in the Wilson mine in Wagontown. The chute was found at the connection of the upraise from the tunnel, and the winze. We understand that Capt. De Lamar will commence at once to run a drift on the lode into the hill. The winze is now about 168 feet deep. By running a drift east 100 feet, a depth of 200 feet will be attained. The prospect looks favorable for Wagontown to make a lively camp.

**THE DURANGO GROUP.**—Wood River *Times*, Dec. 2: Quietly—so quietly that it is hardly known outside of Bullion—Professor Jenney has caused work to be resumed on the Durango group, and is pushing developments with the utmost vigor. He has hoisting works, boarding-houses, blowers, and all the requisites of a first-class mine, and is working down from the surface, and horizontally on the 700 or 800-foot level. When the proper place is reached, a raise will be started to connect the surface with the deep workings, and when this is done the Durango will be as well opened a mine as there is anywhere, as it will have fully 700 feet of ground exposed and blocked out, ready for stopping above the tunnel level. This "tunnel level" is nothing more nor less than the Bullion-Ophir tunnel run by Col. Wall. Being started upon and run through the Durango group some considerable distance, both the Durango group and the Bullion-Ophir group owners have a right to use it jointly, either for development or exploitation, and Professor Jenney has availed himself of this right. Some 25 men are employed on the Durango group, and if, as is expected, a paying chute of ore is struck in the next few months, this force will be greatly increased.

#### MONTANA.

**THE BLACK PINE.**—The Black Pine Mining Co., consisting of Judge Barrett, Henry Williams, R. B. Wallace, J. A. Pack, and others, are said to have over \$150,000 in sight in their property on the head of Willow creek, 25 miles from Drummond.

**THE MIDLAND.**—The Bi-Metallic strike reported is not in the Bi-Metallic mine, but in the Midland, a vein struck in crosscutting from the Bi-Metallic works. The Midland was jumped by a man named Martin, who claims that the full amount of \$500 worth of improvements, necessary to secure a patent, was not performed, the company having included as a part thereof a stone house.

**POSSIBLY A COMING SALE.**—*Helena Independent*, Nov. 25: F. M. Chadbourne has taken a bond on the Bluebird and Hickey properties for \$55,000, extending to January 1st. He acts in the interest of English capitalists. Mr. Chadbourne is not able to say whether or not his principals will take the property under the bond.

**MINERAL DEVELOPMENTS.**—*Inter-Mountain*, Dec. 2: The Inter-Mountain noted from a reliable source this morning a few facts concerning some new and promising mineral developments in the Boulder and other localities near Phillipsburg. The reports continually reaching us from that growing country are verified by every visit of mining men, and those capable of judging of the merits of a new country. Here are a few new developments:

**ELKHORN.**—*Inter-Mountain*, Dec. 2: Reliable information comes from the Elkhorn that the owners of that mine will soon resume sinking the shaft from the 600-foot station and will go down 100 feet additional, introducing steam drills. They are experiencing some difficulty in securing competent men to be placed in charge of the new machines. The mine is in good condition and the water under control. Foreman Mahoney is in the city for the purpose of securing miners, and an additional force will be put upon the mine to open new ground and prepare for more extensive operations. For the past year the mill has been operating almost entirely on ore taken from parts of the mine before practically abandoned. The Clark Bros. have completed their new 10-ton smelter near Elkhorn, and are now running it on the product of a mine which they own and which gives promise of early prominence. The big ledge recently uncovered at a point about two miles from Elkhorn, and over which such a sensation was created about one month ago, is being actively worked. The ledge is 30 feet wide and carries galena in such form as to indicate a more compact body and depth. The general outlook at Elkhorn is good, and the camp feels the inspiration of the mineral developments.

#### NEW MEXICO.

**REVIVAL OF MINING.**—*Socorro Bulletin*, Dec. 4: We have no hesitation in stating that from one end of New Mexico to the other a revival in mining is taking place. The world is just awakening to the fact that this Territory is the repository of untold wealth of undeveloped rich mineral, awaiting the touch of capital to become productive. Mining property is in demand, and among the sales of property within the past week that of the Bremen mine for \$700,000 to St. Louis parties is notable, the owner reserving one-fifth interest in the property. Sales of interest in two Santa Fe county claims are also reported—one for \$15,000 in the Benton, and the other \$21,000 for an interest in a gold claim in the same vicinity. In Socorro county recent sales have been effected, and another is on the tapis, which involves a large sum. In Sierra county several important transactions have taken place and others are pending. From the Mogollons to the Ladrone in this county renewed activity is manifest and miners are confident and active.

**PUEBLO DISTRICT.**—Sep Louis is pushing down on his heavy galena lode, which holds out well at 65 per cent of lead, beside the silver and gold. Shipments are made regularly to the smelter at Socorro. J. D. Burchard and C. A. Barton are sinking down on the Hopeful lode with good results. They are

down 40 feet and are not going to stop until they get down to water level, the present working showing very well and getting good results from the ore sampled. The Hopeful lies north on Gold Hill, and is on the same vein as the Golden King lode, belonging to the Brittenstene boys. Edward and William Brittenstene are working the Morning Star mine, on Gold Hill, one-half mile from the stamp-mill. It is their intention to sink a working shaft of a depth of 300 feet before crosscutting the other lodes, which are opened out by three shafts, in depth from 75 to 125 feet. Said Morning Star lode is a cross lode and cuts three lodes in a rift, and all show plenty of ore of galena, iron and free gold, beside a good part of silver.

#### OREGON.

**QUARTZ AND PLACER.**—*Jacksonville Times*, Dec. 3: Considerable prospecting is going on in the Gold Hill region. Several miners have enough water to clean up ground that was left over last season. About 80 Chinamen are now in the Galice Creek district, and are taking out more or less gold dust. A scarcity of water still continues, which is quite discouraging to the miners, none of whom are at work as yet. Ray & O'Donnell are running a tunnel to tap the ledge they found on Gold Hill several months ago. They have progressed 50 feet. Legg & McDonnell have their hydraulic mine in Forest Creek district in good shape, and will make a big run if the winter is at all favorable. Work is now progressing on the tunnels of the parties who have bonded the Green ledge in the Galice Creek district, with favorable prospects. A. W. Sturgis, of Forest creek, is running another ditch, about a mile long, which will soon be completed and afford him a good supply of water. Jos. Goldworthy, of Footh Creek, came to town last Friday with a nice lot of gold dust which had been cleaned up at the mines in which he is interested. Nelson Hosmer, of Footh creek, an enterprising miner, is having several hundred feet of hydraulic pipe manufactured at K. Kubli's establishment in this place. Pomeroy & Co. are running a tunnel at their iron mines near Rock Point, and are piercing a vein of ore 15 feet wide, which has many indications of silver. Bauble, Klippel & Co.'s mill is running day and night and is doing good work. It is a first-class one and will prove a success if properly managed. Several clean-ups have been made, which proved satisfactory. Groh & Braendel have had several tons of quartz from their ledge on Jackson creek crushed by Bauble, Klippel & Co.'s mill, which turned out well. It averaged about \$15 per ton. There is a large quantity of this ore in sight. A Corvallis correspondent writes that John Riley, Frank Fisher, Geo. Kennedy, and N. L. Raber, inventor of the gold amalgamator, returned last Saturday from Gold Hill, where they have been for the purpose of testing their machine. They returned fully confident of its success, and will immediately commence the construction of two more larger machines.

#### UTAH.

**REVIEW.**—*Salt Lake Tribune*, Dec. 3: The eleventh month of the year closes with this week. For these 11 months the receipts of bullion in this city, excluding all ores, have been as follows, as per current weekly statements: January, \$328,852.66; February, \$456,024.03; March, \$469,722.63; April, \$519,666.08; May, \$387,891.49; June, \$527,036.97; July, \$585,644.38; August, \$480,141.49; September, \$491,129.32; October, \$377,104.59; November, \$369,601.04. Total, \$4,992,864.58. For the week ending December 1st inclusive the receipts of bullion were \$91,146.01; of ore, \$51,087.82; a total of \$142,233.83. For the previous week the receipts were \$129,240.88, of which \$105,867.38 was bullion and \$23,373.50 was ore. The Ontario product for the week was 16,176 ounces of fine bullion, and 19,603 90 from two lots of ore sold, a total of \$35,779.90. The usual monthly dividend of 50 cents per share, amounting to \$75,000, was paid in New York on the 30th, being the eleventh dividend of the year, \$5.50 per share, aggregating \$825,000. The full \$6 a share for the year, or \$600,000, will be rounded out this month. The daily output for the week was 13 bars of bullion, 18,570.47 fine ounces, and all goes well. The receipts of fine bars for the week were \$38,027.98; of base bullion, \$14,400. The Hanauer smelter produced during the week \$19,130 in bullion. On the 26th the Stormont sent up \$2840 in fine silver. The Horn Silver is said to be taking out ore and storing it in the drifts—good ore, too; but it is mere rumor that cannot be vouched for.

**MINING IN TINTIC.**—*Salt Lake Tribune*, Dec. 3: Mr. Matthews, of Tintic, reports the local outlook very encouraging. The Tintic M. & M. Co., owners of the Northern Spy, has struck the best body of ore it has yet found, which assays 80 ounces and upward, the proportion of gold being \$16 to \$35. The Beck-Champion and Eureka people have lately opened up new ore bodies from which great things are promised. The Keystone folks are all smiles over their prospects, and the Mammoth is turning out a fine lot of ore assaying \$10 to \$35 in gold. The Mammoth is shipping its ore, containing copper, silver and gold, to the Argo smelter in Denver, which some Gentle miners are claiming there is no necessity for, seeing there are facilities for doing the work in Tintic. Mr. Matthews believes Tintic to be the champion mining camp of the Territory, and that ere long it will rank among the first in the country. One hundred and fifty tons of ore daily are now being shipped out of the camp and there is employment for everybody who will work. The local mining companies would be glad to see the D. & R. G. Western run a branch to Tintic, as that would lower the present \$4 rate charged by the U. P., which is hard to bear. A miner stated the other day that the U. P. were charging \$5 per ton from Tintic to Denver; but this must be a special rate to shippers agreeing to send their bullion East from Denver over the U. P., as inquiry at the U. P. office failed to show that \$5 was a regular rate. The U. P. is charging Idaho miners \$18 to Salt Lake City and \$20 to Denver, which has occasioned more or less kicking in Salt Lake as discriminating so in favor of Denver; but one Idaho miner says he has no objection, as the bullion rates are \$8 higher from this city to the river than from Denver. A Bingham mining man states that the D. & R. G. Western has steadily refused, in making rates from there, to discriminate in favor of Denver.

## NOTICE TO GOLD MINERS!

# SILVER-PLATED AMALGAMATED PLATES

### For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER  
FULL WEIGHT OF SILVER AND BEST QUALITY OF WORK GUARANTEED.

## THE FRISBEE-LUCOP MILL,

## A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or  
other Mineral Substance to any degree of fine-  
ness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh  
dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York  
Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on  
application.

## THE FRISBEE-LUCOP MILL CO.,

Office, 104 & 106 Washington St., NEW YORK.  
OR PACIFIC IRON WORKS, SAN FRANCISCO.

Practical Treatise on Hydraulic Mining.  
By AUG. J. BOWIE, JR.

This new and important book is on the use and con-  
struction of Ditches, Flumes, Dams, Pipes, Flow of Water  
on Heavy Grades, methods of mining shallow and deep  
placers, history and development of mines, records of  
gold washing, mechanical appliances, such as nozzles,  
hurdy-gurdys, rockers, undercurrents, etc.; also describes  
methods of blasting; tunnels and sluices; tailings and  
dump; duty of miners' inch, etc. A very practical work  
for gold miners and users of water. Price, \$5, post-paid.  
For sale by DEWEY & Co., Publishers, 252 Market St., San  
Francisco.

**DEWEY & CO.'S** SCIENTIFIC PRESS PATENT  
AGENCY is the oldest estab-  
lished and most successful on the Pacific Coast. No. 259

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.  
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.  
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

## Mining Share Market.

The share market has been in a very excited state during the past week. The failures of several large brokers have caused other and lesser ones, all of which have been disastrous to holders of stocks. People who had counted their gains by thousands found that they could get neither their money nor stocks from the brokers with whom they had entrusted them. It is stated that some \$4,000,000 have been withdrawn from the savings banks in the last 10 days, most of which has presumably been invested in mining stocks.

The failures have had the effect of checking the steady advance in prices, and violent fluctuations have occurred. Toward the close of the week prices have dropped very materially. The main interest is centered in Con. California and Virginia, but other stocks have, of course, followed the fortunes of the leader. The excitement has been followed by a similar one in New York. Many mines are being listed on the stock boards, and retired brokers have gone into business again, being apparently assured that the stock market has "come to stay." When the final big break comes on those claims which have no merit, the poor people who are now investing will have cause to regret having gone into a business which only those who can afford to lose should touch. Con. California and Virginia is milling nearly 3000 tons a week of ore assaying about \$40 per ton. But whatever merit there is in this mine should not influence every other one on the lode. Yet it seems to, and people buy anything with a name and printed stock certificates.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court Department 10, San Francisco:

**SWEDISH CO-OPERATIVE TRADING ASSOCIATION,** Dec. 8. Object, assisting natives of Sweden in buying and selling lands, etc. Capital stock, \$100,000 in \$10 shares. Directors—John Tillern, John O. Nordell, Nils Quist, J. Anderson and G. Wickford.

**JOHN WIELAND BREWERY CO.,** Dec. 8. Object, to carry on the Philadelphia Brewery business of the late John Wieland. Capital stock, \$720,000. Directors—Sophie Wieland, John H. Wieland, Robert P. Wieland, Olga M. A. Wieland and Alvin P. S. Sherman.

**PEN DAREN COAL CO.,** Dec. 8. Capital stock, \$1,000,000. Directors, Arthur F. Price, A. R. Green, H. W. Duncan, J. D. Sullivan and D. Gutman.

**PACIFIC DEVELOPMENT AND INVESTMENT CO.,** Dec. 8. Object, to construct railroads, bridges, telegraph lines and water-works for the supplying of cities, as well as canals for irrigating purposes. Capital stock, \$1,000,000. Directors, Louis J. Pouvert, New York, and John T. Davis, A. J. Rhodes, S. M. Holmes and James McMechan, of San Francisco.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Alice, Dec. 1, \$26,400; Lexington, 1, \$35,456; Richmond Con., 2, \$30,221; Eureka Con., 2, \$7863; Hanauer, 1, \$4950; Bannock, 1, \$3750; Queen of the Hills, 1, \$1120; Hanauer, 2, \$2450; Bannock, 2, \$1775; Silver Reef (for Nov.), \$24,285; Hanauer, 3, \$4025; Queen of the Hills, 3, \$2573; Overland, 3, \$750; Alice, 4, \$11,337; Stormont, 4, \$2250; Queen of the Hills, 4, \$1060; Bannock, 5, \$1700; Crescent, 5, \$8600; Hanauer, 5, \$6877; Queen of the Hills, 5, \$1110; Eureka Con., 5, \$10,184; Con. Cal. and Virginia, 5, \$99,250.

**CORRUGATED IRON WORK.**—Owners of saw-mills, planing mills, furniture factories, cotton gins, and in fact all manner of manufacturing establishments where there is great danger from devouring fire, and insurance is correspondingly high, should lose no time in adopting every means of protection from the destructive element. Among other things, iron roofing and siding is probably the most extensively used to protect from fire originating on the outside, and corrugated or crimped iron ceilings and interior linings to protect inside woodwork. Foremost among the manufacturers of iron roofing, siding, ceiling, lining, etc., in various styles is the Cincinnati Corrugating Co., whose mammoth works are located on Eggleston avenue, Cincinnati, Ohio.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

**FRANG'S HOLIDAY CARDS.**—L. Frang, of Boston, is again ahead of all other art publishers in the originality and rare perfection of design and finish of his large variety of Christmas and New Year's cards. Every lover of true art will find pleasure in examining Frang's American holiday presents for this season. Their real merits guarantee the purchaser lasting satisfaction.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING NOVEMBER 30, 1886.

353,345.—CAR STARTER.—S. Baker, San Jose, Cal.  
353,347.—REVERSIBLE PLOW.—Benson & Hollis, Boulder creek, Cal.  
353,286.—CAR TRUCK.—Thomas Carter, S. F.  
353,295.—MOTOR.—T. Duffy, S. F.  
353,489.—ANGLE HANGER FOR TELEPHONES.—Michael Gerst, S. F.  
353,565.—CAR COUPLING.—W. H. Keen, Woodbridge, Cal.  
353,310.—DYNAMO ELECTRIC MACHINE.—N. S. Keith, S. F.  
353,500.—CONCRETE MOLD FOR SUBWAYS, ETC.—E. L. Ransome, S. F.  
353,501.—BRICKS.—E. L. Ransome, S. F.  
353,518.—CAR COUPLING.—A. N. Towne, S. F.  
353,519.—CAR COUPLING.—A. N. Towne, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**CAN TOP AND COVER.**—Frederick A. Robbins, assignor to W. W. Montague, S. F. No. 353,160. Dated Nov. 23, 1886. The object of the invention is to provide a cover and means for retaining it open or closed, and is specially applicable for packages containing articles in a dry condition, such as tea, etc. All the actuating parts of the cover are upon the outside of the can, and are easily applied after the can is finished.

**CAR COUPLING.**—John J. Bogard, Tehama, Tehama Co. No. 353,118. Dated Nov. 23, 1886. This is one of that class of car couplings in which a latch is held forward under the influence of a spring and sustains the pin, which is dropped by the contact of the entering link with the latch, whereby the latter is forced back, relieving the pin, which drops through the link. The invention consists in the arrangement of the latch with respect to the draw-head, the means by which it may be retracted from the side of the car when it is wished to uncouple the car from below, and the means by which the device is uncoupled from the top of the car, together with details of construction relating to the link and its attachment to the car, and a removable shoe for the draw-head. The use of this coupling avoids the necessity of passing between cars to couple them together.

**BRICK.**—Ernest L. Ransome, S. F. No. 353,501. Dated Nov. 30, 1886. This invention consists of bricks or like molded articles manufactured from aqueous or volcanic tufas or tuffaceous earths, such as are found in the State of California and elsewhere. These tufas vary in composition, some being silicious, some silicious and aluminous, some silicious, aluminous and calcareous, some silicious and calcareous, and some calcareous. The invention relates to the whole class of tufas, inasmuch as they all have the common properties desirable in the manufacture, as being in a comparatively soft and friable condition, easily pulverized and granulated, and possessing more or less chemical activity when properly treated either alone or with the addition of a small percentage of lime. Mr. Ransome, by his peculiar method of treatment, patents a new article of manufacture in the form of an unburned brick made from tufa or tufa and lime. Some of the bricks are enameled, and any of them can be beautifully colored. The bricks made by this process are hard, durable, hydraulic and impervious to water.

## MINING ENGINEERS.

**W. A. GOODYEAR,**  
Civil and Mining Engineer,  
MINING EXPERT AND GEOLOGIST.

Address "Business Box A," office of this paper, San Francisco.

**ROSS E. BROWNE,**  
Mining and Hydraulic Engineer,  
No. 307 Sansome St., San Francisco.

## California Inventors

Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as Journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS No. 252 Market St., San Francisco, Elevator, 12 Front St.

## HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

**No. 1 (XX) is the Strongest Explosive Known.**

**No. 2 is superior to any powder of that grade.**

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

## SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.

E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

SEND FOR CIRCULAR.

copper and brass.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

**BALFOUR, GUTHRIE & CO.,**

316 California St., San Francisco.

.....BUILDERS OF.....  
**MINING MACHINERY.**

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

### WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

### WATER JACKET SMELTING FURNACES

### THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE of OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH of the YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

### BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

MARSHUTZ &amp; CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

## The Acme Engine.

There has been quite a demand of late for small engines and boilers for boat and launch propulsion, which would admit of the use of liquid fuel, so as to get rid of the necessity of carrying a heavy weight of coal. Of these, the latest is the Acme automatic safety engine, engravings of which we show on this page. We examined a pair of these engines this week at the Joshua Hendy Machine Works, in this city, agents for this coast.

These engines are upright, double cylinder single acting, with cranks 180° to each other. The pistons, being one and one-half times the stroke in length, form their own guides. The wrist-pins are slightly below the center of the pistons, and the steam rings above the wrist-pin. The cranks are of steel, of large size, both in diameter and length. The main bearings are two and one-half times the diameter of shaft, and are bushed with bronze, which bushings are made on the interchangeable system and can be renewed when worn. The cylinders are directly over the center of the shaft, so that the engine may be run either way, as may suit convenience.

The valve is of the balanced rocking type, of extra large and long-wearing surfaces, and is placed on the top of the cylinders, the valve-case forming the cylinder head. This arrangement gives opportunity for long ports and gives quick admission and release, and makes the action of the cut-off governor sensitive to the slightest change in speed or load. The fly wheel is of cast iron, turned true all over; is perfectly balanced and has within its periphery the automatic governor, which regulates the admission of steam to suit the varying loads by changing the throw-off of the eccentric that actuates the valve. This automatic governor is very simple, consisting of only four pieces, and is positive in its action and peculiarly adapted to a high-speed engine in all places where an even speed is essential. Lubrication is accomplished by carrying in the crank-case a mixture of oil and water, into which the cranks dip at every revolution, and are not only flooded themselves, but throw the oil to every part inside the case, the wrist-pins on the hollow pistons getting a good supply at each stroke, also the lower part of the cylinders, whence it is wiped by the pistons. As this oil cannot escape, it is used over and over, and the oil supplied to the main bearings is all caught by wipers, and returned to the crank-case at last. The eccentric rod-strap and bearing, and the outer bearing of the valve stem, are the only earings not constantly flooded while engine is

running. The boiler is of the sectional type of extra strength; an economical steam generator, and has a very rapid and natural circulation, increased in its rapidity by the intensity of the fire, and all sediment is deposited in the water space below the fire, where it can readily be blown out or removed when boiler is cold. The water being carried in a series of rings connected by inclined tubes that break joints, the fire is compelled to reach every part in its passage through them. The boiler is double

REAR VIEW.

fuel is constant, may be run for an indefinite period with little attention and no noise or jar from lost motion, as all the labor is done in one direction.

The marine or boat engines are supplied with a link motion and lever for reversing, hand-wheel, and flange-coupling for connecting the propeller shaft, and are capable of being run at high rates of speed and high steam pressure.

These engines are adapted to all purposes where a light power is required, are almost

FRONT VIEW.

THE ACME AUTOMATIC SAFETY ENGINES AND BOILERS.

jacketed to prevent loss of heat by radiation.

The fuel used is kerosene oil of 110° to 150° fire test (this grade giving best results), atomized by a steam jacket and controlled by an automatic fire regulator that reduces or cuts off entirely the supply of fuel when the steam pressure reaches the limit at which the regulator is adjusted. The fire gives an intense flame and heat, is easily controlled, and makes an even and constant supply of steam. The fuel is clean, there being no dust, ashes or smoke when the fire is properly adjusted, and is cheaper than coal. As it is not subjected to any heat or flame until it enters the fire tube, it is as safe as an oil lamp.

The agents state that from 4 to 4½ gallons of this grade of oil will on a one-horse power give a brake horse-power for ten hours, at a cost in accordance with the price of oil in the locality used.

The stationary engines and boilers are fitted with steam gauge, reading to 160 pounds, water-glass gauge, pop safety valve, and automatic fire regulator; and if the supply of water and

noiseless in their operation, and can be easily managed by any person of ordinary ability. The workmanship of these engines is of the best, all parts being made to a system of gauges and templates. And each engine is set up and fully tested under steam before shipment.

These engines and boilers are especially adapted for use as the motive power for yachts, small harbor, river and ferry boats, for running printing presses, sewing machines, small electric dynamos, and for any mechanical work where light but steady powers may be required.

ADDITIONAL reports confirm the news that valuable silver mines have been found near Stein's Pass, on the Southern Pacific, in New Mexico. People are leaving Benson, A. T., daily for that place. A claim was recently sold for \$75,000.

THE ore worked at the Consolidated Virginia mine last week assayed \$34.35 as a whole. A shipment of \$69,320 was made on Saturday, of which \$30,299 was gold and \$39,021 silver. This is the first shipment on December account.

## The Signal Service in California.

Although there has been a branch office of the U. S. Signal Service in San Francisco since the service was started, it has up to a few years since been in charge of a sergeant, whose sole duty was to collect meteorological data and forward it to Washington. A couple of years since, however, a lieutenant in the service was sent here who took hold of the matter in earnest, and began to make the service of local

value. He was removed after a short stay and Lieut. W. M. Glassford sent in his place. Lieut. Glassford has been most energetic in the conduct of the service here, has given us regular weather predictions, and largely benefited the fruit-growers of the State especially. Aside from the scientific value of his observations, the economic value has also been proven. Now the telegraph brings information that Lieut. Glassford has been removed for some reason known only to the Chief, Signal Officer, and transferred to Arizona, and Lieut. J. E. Maxwell is to take his place.

It is greatly to be deplored that such a removal is to take place. Lieut. Glassford seemed the right man in the right place. He has made a special study of the peculiar climatic features of this coast, so different from other sections of the United States. He has made public his observations and conclusions so all could have the benefit of them. Now a new man is to come, who will have to go over a great deal of the same ground.

In this particular service of the Government local experience should count for a great deal, and when one of the officers gains this experience and utilizes it to the satisfaction of the public, he should be retained in his place and not be removed here and there for no apparent reason. That Lieut. Glassford's services are appreciated is shown by the numerous telegrams from influential persons and corporations here, asking that he be retained in his present station. He is regarded as one of the most energetic and efficient men in the service, and the community will regret his removal to other scenes.

AFTER being shut down for three months, the Nogales smelter started up on Tuesday last. During the time it was shut down several needed side-tracks and other improvements were made. The company starts up with over 100 carloads of ore on hand.

THE first mining company to pay the \$1000 (late \$250) for listing at the San Francisco Stock and Bond Exchange is the Hayward Gold and Silver.

## The Minting of Gold and Silver.\*

NUMBER 6.

[By ALBERT WILLIAMS, JR.]

## Coiner's Department, Continued.

**Pressroom.**—After the whitening process, and having been reweighed, the blanks are delivered to the foreman of the pressroom and coined. The pressroom is at the southwest corner of the first floor. It contains six coining presses, four of which are used in making double-eagles and standard dollars. These larger presses turn out 80 pieces per minute, and exert a pressure which is stated at 175 tons or more. One of these, known as Black Boss, was taken to San Francisco before the construction of the first mint there, and was used by private coiners. It has been in operation very steadily, and is said to have coined over \$400,000,000 gold. Another press is of the Ajax model, previously described. The smaller presses coin subsidiary silver or small gold pieces. They strike from 120 to 140 pieces per minute, exerting a pressure of from 30 to 60 tons, according to the denomination made, and have brass levers. The lubricant for the presses is refined sperm oil. From the pressroom the coin is returned to the weighing-room. After coining, the dies are taken from the presses and stored in a vault.

The "making-up" of coins.—The legal weight of \$20,000 in double-eagles is 1075 ounces. The number of pieces requisite to represent that sum are placed in a steel pan upon the scales. In case the weight is too great, some of the pieces are withdrawn and are replaced by "lights" until the legal weight is obtained. The coin is then put into boxes, 1000 pieces in each, and the superintendent is notified that an amount of coin is ready for delivery. The cashier of the mint, representing the superintendent, selects the number of coins provided by law from each box and weighs them with his standard weight. If the weight is within the legal limit, the delivery is accepted and a receipt is given. The assayer's representative also takes one piece (which he replaces by another), to be disposed of as the law directs. The condemned blanks and coins are delivered to the superintendent in the same manner as the clippings. The dust and filings are retained until the annual settlement.

**System of accounts.**—As an instance of the care taken in the mints to prevent loss or error, and to keep a complete and intelligible record of all operations, an outline of the system of bookkeeping practiced in the coiner's department of the mint is quoted below from a report made by Mr. Cicott. In the other departments of the mint, and indeed throughout all the branches of the mint bureau, a similar system is observed. It would be well if the same care were taken in all mining and metallurgical establishments, for comparisons and improvements in practice can best be made by means of accurate records of daily results. A few of the mining companies pursue the plan of recording their operations in some detail, and it is noteworthy that in precisely such cases the closest and most successful working is to be found. This is to be expected, if for no other reason than that a detailed system of accounts involves constant and minute inspection. The books containing the accounts with the different branches of the coiner's department in the San Francisco mint are the journal, ledger, working book, cash book, abstract of coinage and delivery book. The journal shows a complete record of all receipts of ingots and delivery of coin, clippings and "condemns" by days, and fully specified. The ledger contains the same in daily totals. The working book contains in different columns: (1) The number of the melt; (2) the weight of the melt and the number of ingots composing it; (3) the roller's account, setting forth the weight of strips, chips and dust returned, and also stating the amount of loss; (4) the cutter's account, setting forth the weight of planchettes, clippings and dust returned, and also stating the amount of loss; (5) the adjusting account, setting forth the weight of adjusted blanks condemned, blanks and filings returned, and also stating the loss; (6) the milling and cleaning account, showing the weight of blanks (annealed) returned, and stating the loss; (7) the pressroom account, setting forth the weight of coin turned out, and also stating the weight of blanks injured by accident and condemned; (8) the recapitulation column, showing the amount of coin, "condemns," condemned coin, clippings, chips, dust and filings, and the amount of loss on the total workings. The cash book contains the amount of coin daily made, in ounces, on the debit side. On the credit side it shows the amount delivered, in ounces and dollars; also the number of the delivery. The abstract of coinage shows the weight of ingots received monthly, and the amount in dollars of the several denominations (in separate columns) of coin delivered. The delivery book shows the number of the delivery, the number of drafts, the amount in dollars, the actual weight, the legal weight, the variation, and the denomination of all coin deliveries made to the superintendent. Statements of the entire workings of the coiner's department are rendered to the superintendent weekly, monthly, quarterly and annually. The pay-roll is made out monthly.

\*From the census report on the "Statistics and Technology of the Precious Metals" by S. F. Emmons and G. F. Becker, special agents. The description of the mints and the processes applies to the year 1881, at which time the mints were examined.

The roll-book also sets forth the name, date of appointment, and all particulars regarding the resignation or removal of each employee. The supplies are procured upon a printed requisition to the superintendent, and copies of all such requisitions are kept in the coiner's office. When bills are presented, they are certified to by the officer in charge and are sent to the superintendent for approval.

## Assayer's Department.

The assay department occupies seven rooms at the south end of the second floor, consisting of the office, gold-weighing room, laboratory, fire-assay room, humid assay room, humid assay weighing-room, and the furnace and dissolving room. The assay force is 21, including the assayer, assistant assayer, second assistant, foreman, seven weighers, two cupellers, three dissolvers, two chippers, engineer, fireman and porter. Ten Oertling and two Becker balances are in use.

**Sampling.**—The chips from deposit assay gold bars are taken in the assay department. They weigh 0.27 ounce each. The silver granulations weigh several ounces, of which 0.45 ounce is taken for each of the pair of top and bottom samples. With large melts of gold the samples are diagonal corner chips from alternate bars cast. The chips of mint-fine gold weigh 0.30 ounce each, and those of mint-fine silver 0.25 ounce.

**Assaying.**—Duplicate assays are made for gold and for base metal. All assays of silver in silver bullion are made by the humid method of Gay-Lussac. The gold in silver bullion is determined by the synthetic method, sufficient gold being added to keep the cornet from breaking. All silver assays are reported in tenths of thousands fine.

**Apparatus.**—There are two muffle furnaces in the furnace-room. They have three muffle doors, of which the upper is used for annealing cupels and the two lower for cupelling. There is one assay furnace in the same room. It is 13 inches square, and holds six No. 12 crucibles. The laboratory contains two sand-baths. The boiling is done over a series of large gas-burners. Four pairs of power-rolls are in use—one for lead, one for gold, one for silver, and one for rolling cornets. There are two shaking machines for the humid assay, similar to that at the Carson mint. They are driven by rod from a small upright engine.

## Miscellaneous.

**The building.**—The mint is on the west side of Fifth street, occupying a lot which has a block front between Mission and Jessie streets. It is of Portland freestone, with granite and concrete foundations. It has two stories, a basement, and an attic. The girders are of iron, and the roof is of galvanized and corrugated iron, except in a small part, which is of wood sheathed with copper. The extreme dimensions are 296 by 163 feet. There are two stacks, about 130 feet high, one used for the boilers and whitening-rooms and the other for the refinery, though the two can be used in connection. The building was designed by A. B. Mullett, [architect, and upon its completion, in 1874, the old mint building was abandoned.

**Boilers.**—There are four boilers, arranged in pairs, but so connected that one or more may be used independently. They are 48 inches in diameter, 15 feet long, and have 38 3/4-inch flues each. They consume about three tons of coal per day, when all are in use. The boilers are on the ground floor.

**Engines.**—There are five engines in this mint. The largest, known as No. 1, drives the rolls only. It is a parallel motion beam engine, with vertical cylinder 20 by 45 inches, has Myers' cut-off, and is rated at between 150 and 200 horse-power. The speed is 45 strokes per minute, and is regulated by a Gardiner governor placed five feet from the steam-chest. It was made in San Francisco, and is a fine example of workmanship. No. 2 drives the coining presses and draw-benches, and is in constant use. It is a direct acting 12 by 24-inch 50-horse power engine. No. 3 runs the elevator and the machinery of the sweeps-room (Chili mill, amalgamators, etc.). It has a vertical 8 by 12-inch cylinder, mounted over the crank-pin, and is rated at 15-horse power. No. 4 furnishes power for the hydraulic press. It has a 7 by 10-inch cylinder, and develops 10-horse power. No. 5 is a small vertical eight-horse power engine in the assay department. Its cylinder, six by eight inches, is over the crank-pin.

**Pumps.**—Two steam pumps are used in connection with the artesian wells. There are two of these wells on the ground, one 200 feet and one 250 feet deep. The pumps raise from 40,000 to 60,000 gallons, the amount required by the mint, in eight hours. They take steam at 65 pounds pressure. The water is decanted before being fed to the boilers, but no chemicals are used.

[CONCLUDED.]

The San Francisco Mint is the largest in the world, having a coinage capacity of twice that of Philadelphia and thrice that of the English mint.

## The Granite.

## A Very Profitable Mining Operation.

The annual report of the Granite Mountain Mining Co., Montana, for the fiscal year ended July 31, 1886, contains a full statement of the affairs of the company. The mine commenced paying dividends April 8, 1885. At that date it had only 20 stamps in operation. Ten stamps were added to it—making 30 in all—Oct. 22, 1885. On the 21st day of that month, or the day before the additional 10 stamps commenced dropping, the tenth dividend, aggregating \$440,000, was paid, as the six months' product of a 20-stamp dry-crushing chloridizing mill.

Up to August 4th of the present year, the company declared 11 more dividends, aggregating \$860,000, the product of its 30-stamp mill for the 10 preceding months, making a total of \$1,300,000 paid in dividends from April 8, 1885, to August 4, 1886, an average of \$81,250 per month.

Last May the company contracted for the machinery for another addition to the mill of 40 stamps, which it is expected will be in operation by the first of next January, thus more than doubling its output, bringing it up, say to \$175,000 per month, or \$2,100,000 for the year 1887. This is a very low estimate, and will probably fall far short of the actual yield. President Rumsey, who is in a position to know whereof he speaks, places it much higher. In his report he says: "We expect the product of the new 70-stamp plant will be fully 240,000 ounces of silver, and not less than \$2500 in gold per month. In addition to the above, all our extra first-class ore will be sent to smelters, thus considerably increasing our monthly output." Taking these figures, and rating silver at \$1 per ounce, we find—not including extra first-class ore shipped—that the total output of the Granite mine for the year 1887 will reach \$2,910,000, or, in round numbers, \$3,000,000. This is certainly a most gratifying exhibit.

The company is erecting new hoisting works of sufficient size and power to work the main shaft to the depth of 3000 feet. It is also putting in a new compressor plant and a new pumping plant of the latest and best patterns, the whole to be run by one battery of four steel boilers of 300-horse power capacity, all erected under one roof, and so arranged as to be handled with the least possible amount of expense. These will also be completed about the first of next January.

For the year ended July 31, 1886, the company milled 8388 tons of ore which gave \$1,384,127.54 in gold and silver. The total expense of every nature and kind in Montana and St. Louis—except the purchase of property for the same period of time—was \$280,811.39, showing a net profit for the year of \$1,058,098.63. Is there a mine in the world that can make such a flattering exhibit?

Speaking of the plans of the company, President Rumsey says: "The plans of our company, as far as at present determined, are: First, to continue the sinking of the big shaft (now called Ruby shaft), and at proper intervals, say not less than 100 feet, to crosscut to the vein, and start thence new levels east and west on the vein. By this means we hope to develop our property so as to ascertain not only the value of the mine but also the character of the ore, so that, should it be necessary to treat our ores at depth by some process other than that employed in our present mill, we shall have ample time to erect a suitable plant of sufficient capacity at a convenient locality; and secondly, we propose to push our developments eastwardly by tunnels as rapidly as possible, hoping to develop still greater bodies of ore to supply our present milling plant with work for years to come, and to ascertain the value of the remaining 8000 feet of undeveloped property which we own on the ledge."

Beside the Granite Mountain mine, the company has taken up 10 claims, upon all of which ore veins are found. It has made applications for patents upon five others, and has purchased three, making a total of 19 claims owned by it. It owns 200 acres of land in Flint Creek valley, upon which to build tailings' yards, flumes, etc., when necessary, and has about 10,000 cords of wood on hand.

**THE UNITED STATES TREASURY.**—The United States treasurer has submitted to the secretary of the treasury his annual report, from which it appears that the net receipts of the Government during the year ending June 30, 1886, were \$336,439,727, and the net expenditures \$242,483,138. The excess of revenue over the expenditures was \$93,956,589.55. The receipts were \$12,749,020.68 greater, and the expenditures were \$17,743,796.61 less than last year, making an increase in the net receipts for the past fiscal year over that of 1885 of \$30,492,817. The receipts on account of the Postoffice Department, not included in the above statement, amounted to \$52,997,135, an increase of \$5,687,399 over those of the preceding year. The expenditures increased from \$50,326,314 in 1885 to \$50,682,585 in 1886. The treasurer, then, at great length, describes the operations of the department and makes many important suggestions.

The Belmont Courier says the large smelting furnace built in Eagan canyon, White Pine county, by General Rosecrans 12 years ago, is being taken down and will be brought to Reno and added to the plant of the reduction works.

## Southern California Marble.

One of the most interesting discoveries of the present era of rapid development in Southern California, says the Los Angeles Herald, has lately been recorded. That it will have much to do with the future prosperity of this section there can be no doubt, and in a short time it will create an industry which will employ thousands of men and materially build up and beautify the cities of Southern California. Reference is made to the recent discovery in the Mojave desert of an immense deposit of

## The Finest Marble

And building stone, a supply exceeding any other known deposit in the world. This important discovery was made about two months ago by E. A. McDuffee, a practical mineralogist, who, in connection with several other gentlemen, quietly organized a company and took possession of this grand accumulation of mineral wealth. The location of the quarry is in San Bernardino county, near the station of Victor, on the Atlantic & Pacific Railroad, and the company was formally organized and incorporated October 13, 1886, under the title of the

## Victor Marble Company.

The quarry, to which reference has been made, covers 900 acres, 600 of which consists of a solid bed of marble, having 11 different colors and shades, so far as yet discovered. There will not be the slightest difficulty in getting marble of any shape required, and without flaw. This great bed of marble, practically inexhaustible, has been examined by a number of prominent mineralogists who pronounce it one of the most important discoveries ever made in America.

The other 300 acres, owned by the company, are covered with granite and an excellent article of limestone—both well suited for building purposes. When the expense of lumber, and the enormous quantity annually imported to Southern California for building purposes, is considered, the importance of this will be understood.

## Some Facts and Figures.

The present price of granite in Los Angeles is from \$1 to \$1.50 per cubic foot, Italian marble \$6 per cubic foot, Vermont marble \$5 per cubic foot. The marble from the quarry at Victor can be laid down in this city in any shade or color at \$1 per cubic foot. At these figures, as will readily be seen, it will soon become a favorite building material in the cities of Southern California.

The immense deposit of the Victor Marble Company is located only three miles from the railroad and 100 miles from this city. The railroad company is manifesting a lively interest in the enterprise and will shortly build a side-track to the quarry so that the stone can be loaded directly on the trains. The company proposes also to build a handsome depot of marble at Victor. This will be a curiosity to the numerous overland passengers, as it will be the only railroad depot built of marble in the world.

When the arrangements of the company are completed the builders of Los Angeles, San Bernardino, Colton, Riverside, San Diego and other cities can enjoy the luxury, at moderate cost, of marble-front buildings with tilings and sidewalks of marble.

## The Supply of Lime.

Mention has been made of the quality of lime which is found at this great quarry. There is no finer limestone in the world. The company has now a large kiln with a capacity of 1000 barrels per month, and is building another of equal capacity. The discovery has also been made that hydraulic lime can be manufactured at this quarry. This lime is a very rare article, and is the best lime known. Mixed with other lime, an article is produced equal to Portland cement. From every point of view it is apparent that this enterprise is to become one of the most noteworthy in Southern California. Already several orders have been given in this city for Victor marble for trimming purposes, and estimates are being prepared for its use for other building purposes.

**A TENDERFOOT PROSPECTOR.**—A recently-retired prospector, attracted hither by the improved mining outlook on the Comstock, in conversation with acquaintances last evening said: "I arrived on the Comstock in 1859, blazed trails, run tunnels, prospected and mined on the lode for a score of years. I left, and after hoofing it through Arizona, Mexico, Montana and every mining district west of the Missouri river, I come back here and find more men than I know in the graveyard than on the streets, and youngsters who were not born when I left, call me a tenderfoot."—*Virginia Chronicle.*

**A REVIVAL IN MINING MATTERS.**—The Salt Lake Democrat says: Here in Utah there is a marked revival of interest in mining matters. It can be felt in the air rather than measured by extraordinary figures. Winter has set in early with unusual depths of snow in the mountains. Shipments of ore will fall off, but accumulations upon the dumps will await the opening of spring. Money from the States and the Old World is evidently moving in the direction of the mines, and the presumption is that developed properties or prospectively valuable prospects will be in demand at fair prices from this time on.

# Parry's Native Jujube or Lote Tree (Zizyphus Parryi).

[Written for the Press by Dr. A. K. Kellogg, of the State Board of Forestry.]

"The trees around them all their food produce,  
Lotos their name divine—nectareous juice!  
Hence *Lotophagi* called, which whose tastes  
Insatiate riots in their sweet repasts.  
Nor other home, nor other care intends,  
But quits his house, his country and his friends."  
*Homer's Odyssey.*

Although mention is made of this native fruit in the State Forestry catalogue of trees and shrubs desirable for culture, nevertheless such a compiled list must needs be very brief to come within due limits assigned; hence further details may become desirable from time to time.

Common perception recognizes the truism that where native families, genera and species of trees, shrubs and plants abound, they furnish the best basis of presumptive evidence—if not always proof—that other kindred and choicer sorts will suit similar situations, climatic conditions and soils, often vastly widening in their range.

With our intelligent culturists and nurserymen, it seems needless to urge that the almost universally preferred practice is to resort to the wilds for the strongest seedlings as stocks for propagating purposes. Therefore, with this in view, as in duty bound by our forestry relations, we offer a short description, with pen and ink sketch, of our own native *Lotos*, in order to facilitate ready recognition and to designate the best-known localities for procurement of the home seed supply. Withal summary suggestions of a few foreign sorts that might well supersede the native *Jujube*, and here and there intersperse a practical hint or so to profit, or of economic and commercial value.

Parry's *Lotos* is a zigzag, branching, thorny bush or small tree, 4 to 16 feet high, seldom over 4 to 6 inches in diameter. The leafy spines are long, stout and straight, leaves entire and small—less than one inch—blunt or notched at the top, wedge-narrowing into a slender, short leaf-stem, 1 to 3-flowered, recurved in fruit, and this 1 to 3-seeded, mealy and nearly dry, oval, one-half to three-fourths of an inch long, apex short-pointed on a curved stem of one-half an inch or so. Mostly a shrub well suited for more eminently useful hedges; abounds in gravelly ravines near San Felipe, San Diego county, also at Rock House Summit, of the same region, and east of San Bernardino.

Before inviting specific attention to the most commendable species for culture it seems requisite to make a few concise remarks on jujubes in general; for out of half a hundred or more we can now only refer to a few, but, if deemed desirable, others may be noticed hereafter.

Jujubes are among the most feasible, if not the best, of fruits in the world for jellies and various preserves, or dried, and for a sort of bread or cakes, pies, or served as desserts like dates and figs; in short, one way or another they are eatable and mostly excellent. "It would be safe to say that 400 to 500 trees to the acre—of almost any soil—could be planted, that at two or three years old would yield five to ten pounds to each bush. With any market at all, the fresh fruit would be cheap at a dime a pound for jellifying in the rural way; they would thrive well with less care than a common corn-plant—would double, quadruple and quintuple in four or five years at the furthest, and thence onward for ages; would pay better than strawberries, with half the labor and not a tithe of the trouble in harvesting, nor risk of loss; would even utilize the worst land; have the world for a market, of the dried fruit and jelly, with other uses to be noted further on.

Classic Lote Tree (*Z. lotus*). This is a small tree common to Persia, Africa, Sicily and Spain, and is now cultivated in all regions of the olive, the vine and the fig. Tunisia was the ancient land of the renowned people known as *Lotophagi*. This sweet fruit is of the size of sloes, with large stones, and is borne on every part of the plant like gooseberries, purple-tinged; the farinaceous pulp—separated from the pits and sun-dried—is set aside for winter use; has the flavor of dates and figs. A kind of wine or beer-drink is made by expression, diluted with a little water, but will keep only a few days; doubtless immoderately appropriated together in this or some similar way may have led to a devoted dissipation akin to the poet's conception.

It should be observed, in a general way, that this and all the species are eminently adapted to the borders of deserts—delight in arid sands, gravelly ravine-sides, and rocky ridges—would preserve embankments and prevent fearful washouts without serious obstruction to railroads or casting a length of blighting shadows; but they will grow in any soil—fruit described of delicious taste in the fresh state; also, after exposure to the sun a few days, they are pounded and made into bread. These paste-cakes are only sun-dried so as to well evaporate the little moisture used in making; it resembles, both in color and taste, what we designate as "gingerbread," noted as excellent food for long journeys.

From the horrent, thorny nature of the *Lotos* one might well wonder how the fruit could be collected with facility; but as it is neither tender nor watery and somewhat farinaceous and

leathery-like, and the shrub hardiest of the hardy with tough and elastic twigs, a cloth is spread on the ground and the bush beaten with a stick.

This *Lotos* of the *Lotophagi* must not be confounded with the Egyptian *lotos* (*Nymphaea lotus*), nor with the *Lotos* of Homer and Dioscorides, which is a species of (amatory?) *Trifolium*, inciting, if not causing, a similar infatuation, as the one eaten by the natives of the Pacific in their season; nor with the *Lotos* of Hippocrates (*Celtis australis*), nor with the Italian (*Diospyros lotus*).

Common Jujube (*Z. vulgaris*). This is a small tree of 20 feet, fruit blood-red or saffron, with a sweet granular pulp. In the south of Europe it is mostly served up in the dried state, as a choice sweetmeat of the winter season, known as *Jujube*. The Turks plant these with other trees in front of their coffee-houses that they may enjoy shade, shelter and fruit together.

East Indian Jujube Tree (*Z. jujuba*). Also a small tree of 16 to 20 feet, cultivated in China and Cochinchina, bears fruit of the size of a large cherry, smooth and yellow when ripe. There is, however, a variety of this or perhaps another species that produces an excellent fruit of oblong form, of the size of a hen's egg, known by the name of *Narikellekool*.

Pear-wood Jujube (*Z. xylopyrus*). This tree abounds everywhere in the forests of Comandul. Cattle eat the leaves, young twigs and fruit; the kernel has the fine flavor of fil-

PARRY'S NATIVE JUJUBE OR LOTE TREE (*Zizyphus Parryi*.)

berts, of which the natives are very fond. The timber of the largest trees is also highly esteemed, is of yellow orange color, very hard and durable, and withal very light. Most timbers combining such rare qualities for many uses prove too heavy.

A kindred shrub (*Paliurus*) or ore of this genus both equally common in Judea, The Christ Thorn (*Z. Spina-Christi*). Former, cap or crown-fruited; the latter, doubly-thorned with fruit like a *Sloe*. Rival authors refer to the plausible pliability of their exceedingly flexible twigs—being readily wrought into any form—as having been the one put upon the head of our Savior. But in the light of this New Age would it not be wiser, more worthy, and much more magnanimous to inquire if the evil and the false alike in us, and all mankind, were not wont *non*—as ever of old—to crown the good and the true with thorns?

Lote trees may be multiplied by cuttings from roots or ripe twigs, with care, from layers and root slips, suckers and seeds. These budded or grafted from a few choice foreign parent trees would soon yield a progeny of many millions, adding to the wealth of the Pacific, and an annual income to California alike counted by unnumbered millions.

Our readers would do well to consult the enterprising Chairman of the State Board of Forestry, of Santa Monica (A. Kinney), himself a cultivator and manufacturer of the fruit product for the market. It is to be hoped the public may also hear from so competent a writer furthermore on this or some kindred topic.

Our pen picture is from a specimen contributed by Dr. Parry, whose name it bears, and by the liberality of the California Academy of Sciences, this picture is furnished the patrons of the Press.

THE monthly operating expenses of the Consolidated California and Virginia mine average about \$125,000, including the sum disbursed to employees, while the present bullion shipment is nearly \$330,000 per month.

## A Big Mining Sale.

A mining sale of great importance to Silver City and the southwestern country in general was this week fully consummated, whereby the '76 and Baltic group of mines, 11 in number, passed into the hands of a powerful St. Louis syndicate. The deal comprises the mines above named, the Bremen mill and millsite, teams, wagons and in fact all of M. W. Bremen's mining property except one claim. The consideration is \$700,000.

The new company has organized under the laws of the Territory of New Mexico, under the name of the Bremen Mining and Milling Company.

The new company will immediately commence the development of the '76 mine by sinking a new shaft near the porphyry dyke, 150 feet east of the present main shaft. This shaft will be sunk to the depth of 500 feet, with drifts and levels running out at convenient distances for stopping. A new battery and 15 stamps will be put in place at the mill as soon as the changes can be made. There is little doubt, however, that in the near future the new company will erect an extensive milling plant at the mines, as this would save the expense of transportation from the mine to the present mill, a distance of something over two miles.

For the past 12 years M. W. Bremen has steadily continued the development of these

## American Progress in the Iron and Coal Industry.

English iron and steel masters, at their recent gathering, spent much time in discussing the wonderful progress which is being made in this country in our iron industries. The great advance which has been made in the production of Bessemer steel was particularly dwelt upon. It was considered "simply astonishing" that America should, in the short space of two years, increase her annual ingot capacity from 2,490,000 tons to 4,102,000 tons. The fact was considered still more astonishing that such increase should have occurred during a period of unusual trade depression. When such progress is made under the most unfavorable circumstances, the question was asked, what may be expected of the consumptive and productive capacity of the country when business once more assumes its normal condition of prosperity? The answer seems to worry the British mind in regard to the future of both her home and export trade, in this line of business.

This fear is somewhat mitigated, however, by the expectation that the increased activity on this side will not only keep up but greatly increase the recent demand for billets, blooms and railroad iron from England, and that the calls from the United States will soon put the now idle English mines, forges and blast furnaces once more into active operation. We trust and fully believe that our friends over the water will be disappointed in this respect, and that our own mines, furnaces and mills will soon be able to fully meet the home demand for iron and steel. High wages and labor troubles generally have seriously interfered with our industries of late, but such things are usually mere temporary hindrances. If neither legislation nor a cessation of labor troubles comes to the aid of our iron and steel producers, there will soon be a large movement in the way of a transfer of the iron industries of the North to the South, where at least unskilled labor is more reliable and cheaper. Whatever may be the need, however great may be the demand, and despite of all labor troubles, the United States will soon prove to the world that her domestic mines and furnaces are fully able to meet all home demands upon them.

Notwithstanding the recent rapid progress of our iron industries, there is every reason to be hopeful of a still greater advance in the near future. Mr. Swank, in his recently published history of "Iron in All Ages," indulges in some remarks which are pertinent to what we are writing. He says:

"Our resources for the increased production of iron and steel for an indefinite period are ample, and all other essential conditions of continued growth are within our grasp. We are to-day (1884) the second iron and steel-making country in the world. In a little while we shall surpass Great Britain even in the production of steel of all kinds, and we are destined eventually to surpass her in the production of pig iron. We already consume more iron and steel than any other country. These conditions and results are certainly gratifying to our national pride. They mark wonderful industrial achievements by a young nation in a space of time so brief that we may almost say it dates from yesterday. They are also prophetic of other and still greater achievements. \* \* \* The saying of Bishop Berkeley, 'Westward the course of empire takes its way,' has already received a new interpretation, for the iron industry, the source and badge of material power, which had its beginning in Asia, and afterward passed successively to the countries along the Mediterranean, upon the Rhine, and in the east and west of Europe, and thence crossed the Atlantic ocean, now finds a home in the shadow of the Rocky mountains and by the Golden Gate of the Pacific. It has made the circuit of the world."

Of pig iron the British produced in the first half of 1886 3,536,774 tons (of 2240 lbs.), while in the same period the United States produced 2,637,687 tons. The difference is about 900,000 tons in favor of Great Britain, but the significant fact which does not appear on the surface is that the figures representing the production of this country show an increase of 480,000 tons over those of the corresponding period of 1885, while those of Great Britain are 295,674 tons less than in the first half of last year. This rate of increase will place us ahead of Great Britain before the close of the coming year.

NORTHERN PACIFIC SHOPS.—Work has been commenced this week on the shops for the Northern Pacific Terminal Company in Albina. A start was made on the work in 1883, but Villard's failure stopped proceedings. The buildings will now be completed upon plans slightly modified from the original. The main machine shop will be the largest building in Oregon. The cost of the buildings and machinery will be about \$750,000, and the work will give employment to 500 men. The contract requires the buildings to be finished June 1st.

MECHANICAL EXPOSITIONS PAY.—We have it upon good authority that the proprietor of a large manufactory at Philadelphia made a quiet examination and test of the steam engines displayed at one of the industrial expositions last year. Since the exposition closed he has purchased seven large improved steam engines from one exhibitor to replace old ones. Oh, yes, expositions pay; they pay exhibitors.

PREMIUMS FOR PROSPECTORS.—The Carson Index says: A movement is on foot to induce the coming law-makers to offer a premium for the discovery of mineral-bearing lodes in any part of the State of Nevada, the amount to be contingent on the known value of the ore. It must seem to every one a good proposition, and nothing could add more to the benefit of the State, for whenever prominent mines are discovered, railroads will extend thereto and the taxable property of the State be enhanced in value.

T. A. FRASER, of the Lick observatory, is in Washington and will superintend the removal of the big lenses for the new observatory from Boston to San Francisco.

## TABLE OF CONTENTS.

**EDITORIALS.**—The Acme Engine; The Signal Service in California, 389. Passing Events; The Neglected Gold Fields of California; Annual Expenditures on Claims, 392. Evading the Mining Laws; Furnishing Power; Copper Deposits in Veins; Gold Bullion and Coin; Wires Underground, 398.

**ILLUSTRATIONS.**—The Acme Automatic Safety Engines and Boilers, 389. Parry's Native Jujube or Lote Tree, 391. Vein-Structure in the Longfellow Mine; Approximate Map of Longfellow Mining Claim, Clifton Mining District, Arizona, 393.

**MISCELLANEOUS.**—The Mining of Gold and Silver; The Granite; Southern California Marble, 390. Parry's Native Jujube or Lote Tree; A Big Mining Sale; American Progress in the Iron and Coal Industry, 391.

**MECHANICAL PROGRESS.**—Breaking of Crank and Propeller Shafts; Charcoal vs. Anthracite; A Hand Saw; Transmission of Power by Belts; Mechanical Skill Shown without Mechanical Appliances; Friction and Speed; A Valuable Patent, 394.

**SCIENTIFIC PROGRESS.**—Magnetic and Electrical Forces; Meters for Electric Currents; Utilizing the Expansion and Contraction of Metals as a Motive Power; Men of 240,000 Years Ago; The Great French Tower to be a Huge Lightning Rod; The Earth as an Electrical Conductor; Volcano Dynamics; Cleansing the Atmosphere by Electricity; Heat Under Colored Glass; The Earth's Revolution, 394.

**USEFUL INFORMATION.**—Making Hard Wood Out of Soft; Foreign Matter in Bread; Fire Smothered with Sand; Anomalies of Smell; Powdered Glass; Kerosene Oil; Making Sulphur Joints; A Non-corrosive Lubricant for Brass, 395.

**GOOD HEALTH.**—Art and Science of Eating; Hints for Fat Men; To Remove a Speck or an Eyelash from the Eye; The Diet of Strong Men; In the Elevator; Milk in Arsenic Poison; Lemon for the Hands; Pasteur's Cure for Rabies, 395.

**MINING SUMMARY.**—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 395-97.

**MINING STOCK MARKET.**—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 400.

## Passing Events.

The unfortunate occurrences resulting from the strike of conductors and gripmen on the Sutter and Geary street cable car lines have been the principal local topic for the past week. The cars continue to run, guarded by policemen, new men having taken the places of those who struck. A noticeable feature brought out by the strike is the fact that there must be large numbers of unemployed in the city, since it is said the railroad companies received upward of 1000 applications from men desirous of obtaining situations on the cars, at \$2.25 per day.

During this week the northern counties of California exhibit their citrus products at a fair in Sacramento. Many of these counties are best known for their mineral products, and few supposed that they were able to produce such magnificent citrus fruits. The fair gives but another illustration of the varied capacity of the soil and climate of this State.

We give in another column a statement of the Director of the Mint, showing the increase of the gold deposits at San Francisco for the past year. This proves the assertions made in the Press of late that our gold mines are gradually increasing their product, and that quartz mining in California, so long neglected, is an industry which is profitable to the owners of the mines and the country at large.

## The Neglected Gold Fields of California.

If the people who are now dabbling in stocks would withdraw their money from that business and employ it in actual mining, it would be much better for them in the end. For so employing their means the opportunities in California are at this time exceptionally good, better perhaps for the industrious and patient than ever before. To this class, provided they have money enough to procure suitable outfit and make a fair start, the chances of ultimate success are nearly as good now as they were in the early days of mining. In some respects the conditions were better then, while in others they are better now. There were more sick and destitute men to be seen in the mines 30 years ago than there are at the present time; and, although it was much easier to find a paying claim at that day than it is at this, the earnings of the miners were even then very unequal, the average having been much less than is generally supposed. If a young man capable of performing a fair amount of hard work were now to go out into the gold mines of California determined to spend there a term of 8 or 10 years, he would be as likely to raise a comfortable stake within that time as he would have been had he done the same 35 years ago. Then it was, to be sure, a comparatively easy matter for the miner to get hold of a paying claim, nor did it cost much to put it in working shape. But then it was soon worked out, compelling him to pull up stakes and hunt for new diggings, in searching after which much time was unavoidably lost. The cost of living was great, and the miner, suffering many deprivations and discomforts, was so impaired in health that much time was also lost through this cause.

Now all this is changed. The mining regions of California are notoriously healthy. The necessities, comforts, and even the luxuries of life are there to be had at a minimum of cost. A vein mine once opened is apt to prove permanent, the expense of exploiting and outfitting this class of deposits being, in this age of cheap machinery and general low prices, small, compared with what it once was. This expense, unless the lode to be developed is a masterly one, involving the necessity for extensive exploratory work and plant of large capacity, need not exceed the sum of \$6000 or \$8000, and in many cases may be brought within half that amount. While we have in California many quartz lodes of large size, the majority of them are of such moderate dimensions that they can be easily opened and equipped, there having lately been invented and brought into use a variety of mills and ore-crushing devices, which, while they cost but little, do their work well. Few persons are aware how many of these cheap contrivances are being operated in the State, the number being especially large in the more northern counties, where these small veins are numerous and where long wagon transportation would make the cost of getting in heavy machinery somewhat onerous.

As to the extent and the resources of our California gold fields, suffice to say they surpass those of any other country of which we have any knowledge. They cover millions of acres occupying both slopes of the Sierra Nevada and portions of several ranges situate on either side of the main Cordillera, reaching south into various detached groups of mountains and stretches of desert lying off that way. As they are thus vast in extent, so are our gold fields rich beyond compare. That they should be so, the primitive wealth of our placers sufficiently denotes. For the most part these auriferous districts are easy of access. Into more than half of them the San Francisco morning papers reach the day they are issued. Railroads skirt our main gold belt on the west, running in close proximity to it from one end to the other, branch roads extending into several of the more important mining centers. First-class wagon roads traverse these districts everywhere, the rivers on all the leading routes being bridged. Travel and transportation throughout the whole country is, therefore, safe, cheap and expeditious. In short, the conditions here are vastly superior to those existing in any other gold region extant.

Why a field like this, so broad and inviting, so open to all and so easily reached, should have been so long and so generally neglected, is a matter difficult of explanation, seeing how little encouragement there has been for our

people to engage in manufacturing or other industrial enterprises, except in farming and kindred pursuits, some of which have already been, or are likely soon to be, overdone.

If California offers extra inducements for embarking labor and capital in any one branch of business more than another, that business is mining for the precious metals, more especially gold. The producer of this commodity has nothing to fear from bad times, a dull market or fluctuating prices. For what he has to sell there are always eager buyers—everybody wants it. He does not have to advertise his product, peddling it about and importuning people to buy, as the vender of patent medicines does, his nostrums. The miner does not have to store his gold as the farmer does his wheat, exposing it to the depredations of the rats, while he awaits a rise of half a cent on the bushel; neither does he have to doctor it like brandy nor age it like wine to fit it for the capricious taste of the connoisseurs. The concern of the gold miner is not of bull-butter, adulterated liquors, false labels, imitation trademarks or other of the numerous base and misleading devices bred of overproduction, excessive competition and the tricks of trade. For marketing his wares he is not obliged to have recourse to these or other methods of questionable morality and distasteful to the independent mind.

It will be a fortunate day for California when her people, following the example of the English, shall not only pay increased attention to mining, but pursue the business with something of the system and care bestowed upon it by that more patient, methodical and painstaking race. While we have neglected the gold fields so lying at our doors or worked them in only a partial way, the English-investing public have thought it worth while to go abroad and even explored the remotest corners of the earth in search of this, the more precious metal, there being no notable mines of gold within 5000 miles of London, the metropolis and great financial center of the United Kingdom. They send their experts and agents to all parts of North, Central and South America; to Australia, India, Africa, in short, to all countries that offer or seem to offer favorable openings for inaugurating a gold-mining enterprise, and which, when found, are speedily availed of, these English investors never failing to advance all the money needed to effectually prove anything they take hold of. While many of these ventures have resulted in failure, a fair proportion have been attended with success, many of those more recently embarked in having proved eminently so.

Our English brethren while they evince such greater readiness and even eagerness to engage in gold mining, after having done so are apt to take a much more lively interest in the business than is done by our people. The English companies organized for its prosecution arrange to have regular annual, with sometimes special, meetings, attended usually by most of the shareholders, and whereat a detailed report on the condition and prospects of the mine is submitted to the shareholders, this report including progress of work, expenditures and production made during the previous year. At these meetings, shareholders desiring additional information or enlightenment on any particular point are permitted to seek it from the chairman or others possessed of the requisite knowledge, prolonged and lively discussions sometimes growing out of the interrogatories and answers incident to this interlocutory method of seeking and imparting information. But all the same it answers the end of bringing to light whatever is obscure and keeping the affairs of the company well ventilated. The proceedings had at these meetings, being afterward published in the leading mining journals, both the shareholders and the general public are kept duly posted as to what has been done.

While it is the custom of the incorporated mining companies in this country to hold annual meetings and to report their proceedings at the end of each year, few of the shareholders ever attend these meetings, nor do they know much about the affairs of the company other than can be gleaned from these annual reports, many of which are lacking in detail and otherwise meager enough. As tending to promote greater care, system and economy in the conduct of mining affairs, and to keep themselves more fully posted in regard to the same, it might be well if shareholders would more generally attend these annual meetings.

## Annual Expenditures on Claims.

There are not many days left of the year in which miners may do the assessment work, required by the United States laws, to prevent their claims from being legally taken possession of by other persons. For the past few weeks those who have neglected their annual work until late have been on the claims making the necessary expenditures. A great deal of this work is left to the last week of the year.

In order that miners may refresh their memories in the matter of assessment work, we here reproduce from Copp's Manual, Sec. 392 of the U. S. Mining Laws:

Section 392. The miners of each mining district may make regulations not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground, so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the locations, and such a description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim. On each claim located after the tenth day of May, eighteen hundred and seventy-two, and until a patent has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year: *Provided*, That the period within which the work required to be done annually on all unpatented claims, so located, shall commence on the first day of January succeeding the date of location of such claim. On all claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made by the first day of January, eighteen hundred and seventy-five, and each year thereafter, for each one hundred feet in length along the vein, until a patent has been issued therefor; but where such claims are held in common, such expenditure may be made upon any one claim; and where a person or company has or may run a tunnel for the purposes of developing a lode or lodes, owned by said person or company, the money so expended in said tunnel shall be taken and considered as expended on said lode or lodes, whether located prior to or since the tenth day of May, eighteen hundred and seventy-two, and such person or company shall not be required to perform work on the surface of said lode or lodes in order to hold the same as required by said act. Upon a failure to comply with the foregoing conditions of annual expenditure, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made: *Provided*, That the original locators, their heirs, assigns, or legal representatives, have not resumed work upon the claim after failure and before such location. Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing or by publication such delinquent should fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners, who have made the required expenditures.

It may be remarked, that in reference to the amendment made in January, 1880, and which is incorporated in the above section, relative to the time when assessment work is to begin on a newly located claim, the Land Office holds that labor performed or money expended upon a mining claim prior to the first day of January succeeding the date of location thereof, will not be considered as a part of or applied upon the first annual expenditure required by law. Thus, upon a claim located at any time during the year 1886, the period within which the labor must be performed commences January 1, 1887, and during the calendar year 1887, the expenditure must be made, or the claim will be subject to relocation on and after January 1, 1888.

In order to apply the law to a claim located prior to the year 1880, it will be necessary to calculate from the date of location. For instance, upon a claim located in 1876, the first expenditures would be reckoned as due within one year from January 1, 1876, to wit: January 1, 1877, and annually thereafter by the calendar year.

With these extracts from the laws, miners can see for themselves exactly how they stand. Of course they know that expenditures may be ordered from the surface or by tunnel. They

may also be made by an agent and not the owner himself. It must be remembered, too, that a large expenditure in the past does not excuse the required annual expenditure.

Any co-owner who contributes his share of the annual expenditure can retain his interest. The Land Department offers no remedy where a party fails to contribute his share of the actual expenditure; the courts must decide that. Failure to pay, or work a claim, indicates abandonment. The local laws may prescribe a larger annual expenditure than is required by Congress. A relocation of abandoned ground can only be made at the expiration of the year succeeding the one for which the last annual expenditure was made.

### Evading the Mining Laws.

The mining laws of the United States are more liberal than those of any country in the world. The mineral regions are declared open for exploration, and any one who is a citizen or intends to be one can take up mineral ground and work it. He is not even compelled to pay for it until he has proven it of sufficient value to patent. The only thing required is that he must do a certain amount of work each year to hold his ground—a very good provision indeed, which was designed to prevent men holding ledges for an indefinite period without working them.

This feature of the law was designed specially to protect *bona-fide* miners, as against speculators. Yet, strange to say, we find these very miners themselves trying all sorts of ways to evade the annual assessment work. They do not do the required work, and are then on hand at midnight of the last day of the year and relocate the claim again themselves as a new claim.

Another method of evasion carried out in the mountains is this: They put up a location notice on a claim on the last day of the year, and the local laws require, for instance, that all locations must be recorded within 60 days. They do not record the location, but at the end of about 40 days tear down the old notice and put up a new one dated the day it is written, which is then, within the specified time, recorded.

The first notice has prevented any one taking up the claim until the second one is put up. The recording of the second one puts off any assessment work that year. This is because the law provided that the year within which the annual assessment work must be done begins with the 1st of January after the location is made. A man taking up a claim any time in 1886, for instance, holds the claim without work the rest of that year and has any time between Jan. 1, 1887, and Dec. 31, 1887, to do his first annual expenditure work.

We are assured that this method of evading the law is being carried out in a number of places. It is unfortunate that it is so, since we are all aware of the evils of holding mining ground without working it.

### Furnishing Power.

A number of years ago efforts were made by gentlemen connected with the Risdon Iron Works to form a company to put down pipes to convey compressed air for power. The plan was to have central stations for compressing air to be furnished to certain sections of the city where factories, small shops, etc., were located. On examination it was found that there were not consumers enough to warrant the expenditure for plant, etc., so the project was abandoned.

Recently, P. T. Dickinson, David McKay and N. W. Spaulding applied for a franchise to lay down and maintain and operate in this city a system of pipes for the conveyance of steam, hot water, or fluids other than gas or electricity. The supervisors passed an ordinance granting the franchise, but the mayor vetoed it. At the last meeting of the board, however, the order was passed over the mayor's veto, all but two supervisors voting in favor of it.

There is great need in this city of some such system. There are many establishments in certain sections of the city where small power is needed, which have to maintain steam or gas engines to supply it, when they would prefer to purchase power from a central system if possible. Other large cities have such systems, and they have proved satisfactory. It is to be hoped that the new company will go at once to work to carry out their plans.

### Copper Deposits or Veins.

In last week's PRESS we gave a geological sketch of Clifton copper district, Arizona. The principal mine in the district is the Longfellow. The Longfellow mines, and also those of Bisbee, those of Globe, and those of the Verde district in the Black Range, are invariably found in conjunction with great bodies of clay. Very often near the surface clay only is found, and to all appearance every vestige of rock has been removed. Great stress is laid on this fact by those claiming these veins to be deposits. A close examination of the clay, however, invariably proves it to be a decomposed rock, entirely due to the thermal action which has taken place during the deposition of these copper ores. The copper ore has a true intrusive origin, and has

Fig. 1.—Horizontal Section.

Fig. 2.—Vertical Section.

VEIN-STRUCTURE IN THE LONGFELLOW MINE.

Fig. 3.—APPROXIMATE MAP OF LONGFELLOW MINING CLAIMS, CLIFTON DISTRICT, ARIZONA.

come from the deep. Figs. 1 and 2 of the accompanying cuts show a vein structure common in the Longfellow mine, and illustrate the true vein origin of the ore. The illustrations are from Mr. Wendt's paper on the copper ores of the Southwest, read before the Institute of Mining Engineers. The author, with Dr. Julien, of New York, and J. P. Iddings, of Washington, made microscopic examinations which led to the discovery that the eruptive rocks found even at considerable distances from the veins are all kaolinized or decomposed by thermal action. The surface decomposition of all rocks in Arizona has been very great, and this decomposition, jointly with the thermal action, has produced great masses of clay which have led many examiners to a wrong conclusion as to the character of the veins.

In the Longfellow mine this decomposition of the walls has been very marked. Both walls are often pure kaolin. At Clifton this kaolin, mixed with two parts of sand, has done good service as a fire-resisting material in reverberatory furnaces.

Referring to the accompanying map of the

Longfellow claims, Fig. 3, the strike of the two veins is seen to be across the Longfellow and into the Yankee mine. The pitch of the ore is into the Yankee. The bulk of the ore on the Longfellow claim proper has been extracted, but in depth the Yankee still holds good ore. The claims called the Longfellow, Modoc and Detroit are on the crest of a hill, all composed of horizontal sedimentary limestone, either of dolomitic or shaly character.

On the Detroit claim there is a dyke of a fine-grained green rock, probably a diorite, running parallel with the long axis of the claim, and at right angles with the original Longfellow vein. At the contact of this green rock with the bedded limestone a small string of ore was followed down some years ago and led to the discovery of a great body of manganiferous ore similar to

tonnage still continues, and the outlook intimates that the present asking rates will not decline for some time, as present selling prices of their products fully justify colliery agents in sustaining current rates.

### Gold Bullion and Coin.

The Director of the U. S. Mint, in his official report to the Secretary of the Treasury, calls attention to the very marked increase of the deposits of gold bullion at the mint at San Francisco. The total value of the gold, exclusive of redeposits deposited at this institution during the fiscal year 1886, amounted to \$27,319,837.25, against \$20,774,252.86 in the preceding year, an increase of six and a half millions. This is the first year since 1882 that there has not been a marked decline in the deposits of gold at this institution, the marked decline since 1881 having amounted in the four years ended June 30, 1885, to \$8,072,438.07. The fact that a decided increase of deposits of bullion is taking place is pretty good evidence that the gold-producing mines of this coast are doing better than ever. Those who have paid any attention to the subject know that for the past year the quartz-mining industry of this State has increased its importance and yield. While the total gold deposits of the country have fallen off, as stated below, in California we show a decided increase.

The total value of the gold deposited at the U. S. mints and assay office for the fiscal year 1886 amounted to \$49,606,534.65, of which amount \$4,696,785.46 consisted of bars redeposited, leaving the net value of the gold deposited \$44,909,749.23, against \$52,894,075.09 in the preceding year, a falling off of \$7,984,325. Of the deposits of gold at the mints and assay offices for the year, \$32,456,493.64 is classified as of domestic production, \$4,317,068.27 as foreign bullion, \$397,545.28 old U. S. coin remelted and \$5,673,565.04 of foreign coin. The rest is old plate, jewelry, etc.

A marked falling off in gold deposits during the year was shown at the assay office at New York, where the value of gold deposited, exclusive of redeposits, amounted to only \$13,791,632.29, against \$26,419,503.11 in the preceding year, being a falling off of about one-half.

The coinage of gold, performed exclusively at the mints at Philadelphia and San Francisco, amounted during the fiscal year to 5,050,814 pieces, of the value of \$34,077,380, against 1,748,158, valued at \$24,861,123.50, in the preceding year. Of the gold coinage of the year, the mint in this city executed \$27,080,000; the rest was at Philadelphia. Of the gold coinage, \$4,871,680 was in double-eagles; \$10,428,470 in eagles; \$18,758,145 in half-eagles; \$303 in three-dollar pieces; \$10,215 in quarter-eagles, and \$8567 in dollars.

### Wires Underground.

Many large cities are now compelling the telegraph and telephone companies to remove their poles from the streets and put the wires underground, and the matter has been under consideration here for some time. At the last meeting of the Board of Supervisors of this city an order was passed to print providing for the removal of all poles and wires from the streets before January 1, 1888, and that all privileges to erect poles, heretofore granted, or to be granted, will terminate on that date; the wires to be run underground through conduits. Failure to comply with the order to be punished by a fine not exceeding \$1000, or imprisonment not to exceed six months.

In the meantime, however, on our principal thoroughfare—Market street—the old poles are being removed, and very much higher and larger ones are being put up. These poles are unsightly, and one in front of a finely-designed building is apt to mar all architectural beauty. The fire department complains of the presence of the wires, which interfere with their ladders when fighting fire. The experience of other cities will no doubt be continued here, however, and it will not be many years before the wires will all be placed underground out of sight.

THE owners of the Alcerman mine in Sonora, Mexico, are searching for the whereabouts of the relatives of Edward Jones, who was blown to pieces at that mine a few days ago. The unfortunate man was 46 years old and is supposed to have hailed from Illinois.

PACIFIC COAST COALS.—Arrivals of foreign coals have been falling off, and this has caused an increased inquiry for coast coals, and quite a number of ships have been recently rechartered to carry cargoes from the northern mines to this port and San Pedro. The market is steady in consequence. The demand for coast

## MECHANICAL PROGRESS.

## Breaking of Crank and Propeller Shafts.

The recent breakages of screw shafts on Atlantic steamers, which occurred in rapid succession, have drawn more than usual attention to such occurrences on the part of both ship-owners and mechanical engineers. Accidents of this character are becoming alarmingly frequent of late years. The matter was made the subject of an able and lengthy paper read by J. F. Hall, Esq., before the Twenty-seventh Annual Session of the Institute of Naval Architects held in April last. We collate a few facts from that paper as follows:

The chief object of the paper was to direct the attention of the members of the Institute to an improved method of constructing the crank and screw shafting of steam vessels, so as to enable them to escape the multitude of strains and contortions that such shafting is compelled to undergo either from the incorrect placing of the shafts, or from the imperfect construction of the hulls in which they are placed.

The writer held that it is not altogether through defective material that crank and propeller shafts break. The cause of the breaking is quite as often due to being unduly bent or strained in an irregular line of bearings, which get out of line with each other. Under such circumstances unequal wear and strain take place. This condition of things is often set up when the hull of the vessel slightly alters its shape through the action of the sea, temperature or unequal distribution of cargo. These evils are, moreover, often intensified by the natural flexibility of the hulls, due to the quite common mistake of building them too light. There is no wonder that a shaft should break when so bent at its bearings, for it has to endure not only torsional strains but cross-bending strains as well, alternating with every revolution of the shaft. These strains, coupled with the great vibrations which they produce, distress and fatigue the iron until it becomes crystallized and its molecular arrangement so disorganized that its strength and vitality are well-nigh exhausted.

It is under such conditions that sudden and unexpected breaks occur, in good weather, and when no unusual strain is placed upon the shaft.

Some vessels acquire the reputation of being "crank-shaft breakers"—requiring a new shaft every two or three years—in the majority, seven years is considered a good life for a shaft; while there are a few in which the breakage of a shaft is no more nor no oftener looked for than the bursting of a boiler. The great difference in vessels, in this particular, may be attributed to the weakness in hulls, above alluded to, by which their shafts are thrown out of line and thus unduly strained.

The failure of shafts is quite too often attributed to imperfections in the iron which never existed; and it is said by advanced engineers to be really astonishing how very little attention has heretofore been given to any attempt to rectify the *real* causes of the trouble.

This matter was fully discussed at the April meeting of the Institute of Naval Architects, where it seems to have been conceded that shafts rarely break through mere overwork, but that such accidents almost always occur through something radically amiss in ship construction.

When it is borne in mind that at a single passage across the Atlantic a shaft ever so little out of line will be bent and unbent over a million times, it will not be considered in any way strange that it should give way even upon a single voyage. It is really wonderful that under the circumstances as above rehearsed shafts do not break much oftener than they do.

To meet these difficulties a system of flexible cranks and shafting is proposed, as the most ready means of securing relief from the expense, annoyance and danger entailed by those now used. On a small scale their merits have been already practically tested, not sufficiently, however, to warrant definite conclusions as to their fitness for all cases where rigid shafts have hitherto been found in some way objectionable. Still their performance has been such as to lend encouragement to further trials, and the desirability of these is day by day becoming more apparent. Special couplings, among other means of permitting appreciable deflections of shafts without injury, also offer a partial or possible solution of the problem, and their study is to be recommended.

**CHARCOAL VS. ANTHRACITE.**—The *Iron Age* makes the following notes from the lately issued directory of the American Iron and Steel Association: All the furnaces in New England now use charcoal. The furnace at West Stockbridge, Mass., was the last to use anthracite, and it has been out of blast for several years. Vermont, which once had several active furnaces, has not had a furnace in blast since 1882. There is not now one charcoal furnace in New Jersey, where formerly there were many.

**A NOVEL HANDSAW** has been introduced by a Kansas firm, which practically embodies two saws in one, making not only a great saving of material, but of storage room, and which affords a ready means of either ripping or cross-cutting without being obliged to keep two separate saws lying within reach. The saw has teeth cut in at both edges, one set being designed for ripping and the other for crosscut-

ting. The utility of this tool will be seen at once; and a large field exists in which it will come in use, as, for instance, carpenters in framing timbers must be continually alternating between the crosscut and rip saw, while they only have to turn this one over to make the change. The cost of constructing this saw will not exceed that of the ordinary one, as there is no necessity of grinding it thin at the back, which omission would more than make up for cutting the extra row of teeth. A very neat arrangement in adjusting the handle is provided by which it can be tilted so as to bring the line of push at a considerable angle with the tooth line, and thus cut rapidly. This shifting can be done to either side.

## Transmission of Power by Belts.

A correspondent of the *American Engineer* writes to that journal as follows: I wish to call your attention to a peculiar case of transmission of power by belts that was brought to my notice a few years ago by the superintendent of a large manufacturing establishment in Southern Ohio—his name now escapes me. He affirmed that two eight-inch belts, one running upon the other, will transmit more power than the same belts placed side by side, or a 16-inch belt, on a pulley of the same size and running at the same speed. This is a demonstrated fact, though many of our mechanical friends may doubt it. I have as yet heard no explanation of the fact from any one, and after giving you some account of my experience, I will give you what I think is one reason for it. Something more than two years ago, I was belting up a blast fan for a foundry, and I was overruled by the owners in the question of the size of belt to be used; I wished to put on a 14-inch double belt, but they said that a 10-inch single belt was large enough, and it was put on. The works were new, and they wished to take off the first heat on the fortieth anniversary of the founding of the establishment. Everything being ready for the blast, it was started, but the belt proved unequal to the work put upon it, and could not drive the fan; there was no time to make a change of belts and pulleys and get off a heat that day, and I suggested the double belt, one upon the other. There was no other alternative and they consented to the trial of it. An old eight-inch belt was at hand and it was put on over the 10-inch belt; on starting again the two belts did the work, melting over eight tons of iron in little more than an hour; this arrangement has been in use ever since.

Now why is this so? is the question the thoughtful mechanic asks. My explanation of the extra amount of work done is this: The inner belt has all the work to do and the outer belt only holds it to its work; the inner belt, creeping by the strain on its working side, makes a tension on the outer belt on the opposite side, and it by this tension holds the inner belt down to the pulley; the increased pressure increases the friction and the amount of work done. A belt running at high speed has a tendency to lift from the pulley on the side it goes on. This is caused by centrifugal action, and diminishes its attractive force by diminishing the pressure on the pulley; this is all overcome by the use of the outer belt.

A greater benefit may be expected to result from its use on perpendicular than on horizontally running belts. The theory of this latter action can only be demonstrated by a model showing the friction of belts on different kinds of pulleys.

**MECHANICAL SKILL SHOWN WITHOUT MECHANICAL APPLIANCES.**—It may be a cause of proper pride for a mechanic who has all the materials and the tools necessary to succeed in constructing a machine that shall yield good results; but if one not possessed of the skill obtained by long practice, and unsupplied with proper tools and materials, can attain the same result, to him should be accorded the name of the best mechanic. Referring to this subject, the managers of the *Scientific American* patent office remark that many of the models sent to them to show the principles of an invention, or the points of an improvement, tell of the difficulties which surround the inventor. They are frequently whittled out by the pocket-knife with great expenditure of care, time and labor, the materials not being adapted to the work; yet they bear indisputable evidences of close calculation, mechanical skill and inventive talent. Such facts as these prove that enterprise and natural talent may do much unaided by the appurtenances with which civilization enriches the mechanic.

**FRICTION AND SPEED.**—I have been asked the question, "Does friction increase with speed or decrease?" Both. Where the speed is slow, increasing it may decrease the friction per turn; but where the speed is fast, it may be found that increasing speed increases the friction per turn also. There are two sides to almost every question, and particularly so in this case. The more viscous the lubricant, the greater pressure can be carried upon the bearing.—*Grimshaw.*

**A VALUABLE PATENT.**—The *Age of Steel* understands that \$80,000 has been offered for a patent just issued to a Pittsburgh gentleman for a rod-rolling mill. The mechanism is simple, and combines both the drawing and rolling processes, accomplishing the work in a rapid and most satisfactory manner.

## SCIENTIFIC PROGRESS.

## Magnetic and Electrical Forces.

The following matter is copied by permission in advance from a work called "Human Culture and Cure" by E. D. Babbitt, M. D., the first number of which is soon to be issued. This work aims to develop the science of therapeutics and of human upbuilding based on the great underlying laws of the chemical, electrical, magnetic, luminous, physiological and psychological forces of nature.—*Hall's Journal of Health.*

Magnetism, as Ampere has shown, is merely electricity thrown into curves. A magnet has countless millions of electrical streams drawn around and around into whirlwinds of force by the tremendous suctional power of the vortexes in the atoms of steel through which they pass, and has also a series of streams that are not thus deflected into curves, the strongest of which currents enter at the negative or south pole and emerge at the positive or north pole, while other and weaker grades of electrical ethers pass through the magnet in just the opposite direction. The greatest magnetic tension is at or near the poles, there being no force in the middle of a magnet strong enough to control iron filings. The horseshoe magnet is more powerful than a bar magnet because the suction of both poles can be used. If the positive poles of two magnets are placed together, their powerful streams of ether will strike against each other, and drive each other apart. This is the philosophy of repulsion and explains the well-known expression, similars repel. If a positive and negative end are placed together the electrical currents of both will flow in the same direction and intensify each other, causing them to rush together with great force. This is the explanation of attraction and exemplifies the law expressed by the words, contrasts attract. A hundred mysteries are explained by this etherio-atomic law of force, which thus far has not been understood.

All substances contain some grade of magnetism, or at least of diamagnetism, in which latter the ethers pass through objects transversely instead of longitudinally and work more feebly.

The ordinary magnetism which works with iron and steel is ferro magnetism; another grade which is connected with animal life is called animal magnetism; a higher and finer grade of ethers connected with the mental, spiritual and intuitional nature is called psychomagnetism or psychaura, which is literally soul force. The term vital magnetism may be used to include both animal and psycho-magnetism. In woman the forces are more influx or negative; in man they are more efflux or positive. For this reason, according to the law, already explained, it is conducive to the harmony and activity of the vital forces for the sexes to be frequently in the same atmosphere with each other in schoolrooms, churches, societies and social circles, and is also for the greater purity of both. All monastical and ascetic exclusion of the sexes is founded on ignorance, and leads in the end to lower conditions, as well as to greater misery. Solar magnetism animates and develops much of the vegetable and animal life of the world, and like psycho-magnetism has a wonderful potency in the cure of disease.

**METERS FOR ELECTRIC CURRENTS.**—It is well known that a metallic disk or fork, fitted so that it can rotate, and placed within the field of an electro-magnet, will be rotated if a portion of the electric current traverses the forks. Electric meters based upon this principle have been made and improved upon from time to time until a very accurate meter has been evolved, which, it is claimed, will measure with great regularity and always in proportion to the intensity of the current. Indications can be easily read by the consumer, since the electric energy is indicated in a continuous manner by hands on a dial; thus, the consumer can be aware, in each instance, of the intensity of the current being used. The instrument occupies very little space, is purely mechanical and its indications are correct at all times. A new instrument of this kind has recently been patented in Switzerland, which is said to be very superior in its action and indication. The whole mechanism is an arrangement of parts, consisting of a combination with main and branch circuits, of a helix in the branch circuits, an armature and shaft rotated by the current passing through the helix and armature, a solenoid in the branch circuit and a lever and circuit-closer operated by the solenoid. There is also an electro-magnet or solenoid in a shunt of the branch circuit, together with a shaft carrying the index hand with mechanism for varying the speed of the index shaft according to the variations of current in the branch circuit.

**UTILIZING THE EXPANSION AND CONTRACTION OF METALS AS A MOTIVE POWER.**—A very effective apparatus for utilizing the expansive power of metals, caused by the changes in the temperature of the air, has been patented by Messrs. Hainley & DeLashmuth, of Martinsville, Ill. The device consists of a framework supporting a power generator and another framework supporting a storing device, the two frames being arranged so as to maintain a fixed relation to each other. The first—the power generator, consists of bars of steel and brass, properly supported, so that they may have free thrusts in opposite directions—the expansion of the brass

in one direction compensating for the expansion of the steel in the opposite direction. The frame thus never elongates by changes of temperature, but maintains a normal dimension. Both the thrusts and contractions are taken up by properly arranged crossbars, which in turn are connected by levers with racks and cog-wheels, with ratchet and pawl arrangements, by which the motion is conveyed to a shaft to be rotated. The shaft is connected with a strong coiled spring. By means of this ingenious, yet simple apparatus, any change of temperature will either contract or expand the bars and develop a great power which is stored in the coiled spring through the action of the intermediate parts. Since the temperature of the atmosphere is continually varying, the action of this apparatus produces a continuous power without the least outlay for fuel, an effect that cannot be produced by any other apparatus yet invented. The invention is said to be perfectly adapted to operating all kinds of light machinery up to eight or ten-horse power, and the construction is such that it will continue to give first-class results for a great length of time without repairs.

**MEN OF 240,000 YEARS AGO.**—If the claims of old descent were a justifiable source of pride, the human race would feel elated on being assured by the wise men of the British Association that authentic proof had been discovered in some Welsh caves that men, sufficiently developed from the ape to manufacture flint implements, existed on this planet 240,000 years ago. To us it is a melancholy reflection that we should have taken so prodigious a time to attain so small a result. Even when the duration of the race is limited to the 6000 years of history, the outcome can hardly be considered as satisfactory, and there is something profoundly depressing in the sudden addition of a series of ancestors who spent 234,000 years in marking time, indeed, but in making no other mark in the world.—*Pall Mall Gazette.*

**THE GREAT FRENCH TOWER TO BE A HUGE LIGHTNING ROD.**—A committee of French electricians, to which was referred the question of protecting from lightning the high steel observatory tower at the Universal Exposition soon to be held in Paris, decided that it would itself be a gigantic lightning rod, and that if only care were taken to maintain adequate metallic connection with earth deep enough to be permanently moist, not only would those inside it be perfectly safe during the most violent thunderstorm, but everything near it and for a considerable distance around it would be protected. The earth plates will be of copper, and will be connected with each angle at the base of the tower by substantial cables. The top is to have a tall copper rod with a gilded point.

**THE EARTH AS AN ELECTRICAL CONDUCTOR.**—The establishment of electrical communication, using the earth alone as a conductor, says the *Electrical World*, may be said to be a philosopher's stone to electricians. Not that such a method has not been hit upon and tried with some degree of success, for such is the case, but there is one great drawback to such systems, and that is, their uncontrollability. Following its natural course of seeking the path of least resistance, the current passing through the earth as the only conductor does not discriminate between two instruments, upon only one of which it is intended to act, causing interference, and hence any extended application on this plan seems futile to attempt.

**VOLCANO DYNAMICS.**—In a recently published account of an inquiry into the origin and character of the terrible volcanic outburst in the straits of Sunda two years ago, it is calculated that the matter ejected was equal to at least 10 cubic miles, and that the velocity with which this matter was thrown into the air exceeded the projecting power of the largest guns. The ejected matter must have reached a height of 30 miles, or about six times the height of the loftiest mountain in the world. The explosions were heard over a fourteenth part of the earth's surface; and an atmospheric wave traveled from the scene of disturbance, and spread over the surface of the globe in 36 hours.

**CLEANSING THE ATMOSPHERE BY ELECTRICITY.**—Prof. Oliver Lodge, in a recent lecture before the Royal Institute, of London, illustrated the recently discovered fact that smoke and dust are removed by electricity, by exhibiting a couple of glass jars, filled with dust and smoke, which were instantly rendered clear by discharging a current of electricity through them. He then suggested that a similar discharge of electricity on a large scale into the dust and smoke-laden air over London would produce a like effect. He is desirous of making experiments of sufficient magnitude to test the correctness of his view.

**HEAT UNDER COLORED GLASS.**—Notwithstanding the long-time collapse of the blue glass theory, it is still contended that blue glass exerts a marked influence, at least in the matter of reflected sun heat. Experiments have shown that when from one-quarter to one-half the glass in a hothouse is blue, the heat inside is so greatly augmented that the thermometer will rise to 100° F. inside while outside only 36° is indicated. This is said to be a difference much in excess of hothouses where glass is colorless.

**THE EARTH'S REVOLUTION.**—The equatorial surface portion of the earth moves in its daily revolution at the rate of over 1000 miles an hour, or about 17 miles per minute.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**CAR COUPLING.**—A. N. Towne, S. F. No. 353,519. Dated Nov. 30, 1886. This coupling consists of peculiarly formed draw-heads adapted to interlock with each other as the cars come together, and having a pin-opening lying within each of the heads so that when the pin is introduced it will hold them together, and, in combination with this, a plate or mechanism by which the two heads are prevented from separating by reason of too great vertical movement of one of the cars which they connect.

**ANGLE-HANGER FOR ACOUSTIC OR MECHANICAL TELEPHONES.**—Michael Gerst, Paso Robles, San Luis Obispo county. No. 353,489. Dated Nov. 30, 1886. This is one of the class of hangers which are used for suspending the wires of mechanical or acoustic telephones and for directing them around an angle; and the invention consists in two separate wires attached at one end to the severed ends of the inleading and outleading line-wires, and uniting with said wires at a true right angle, and in a separate wire attached at each end at the junction of the other wires. The object is to provide for the carrying of the line wire around any angle, great or small, in such a manner that the sound waves may pass without loss to their intensity.

**CAR COUPLING.**—A. N. Towne, S. F. No. 353,518. Dated Nov. 30, 1886. This invention relates to a device for coupling or connecting railway cars, and it consists of peculiarly formed heads which are adapted to interlock with each other when the cars come together, and they are connected with a pin-opening, part of which lies within each of the heads so that when the pin is introduced it will serve to hold together. With these couplers any amount of vertical movement may take place short of entirely separating the two heads without interfering with the connection of the cars; but if any accident should take place, the cars will very readily separate by the slipping of one part out of the other. These draw-bars are very economically made, consisting of only one piece, which may be cast, forged or otherwise constructed, and no finishing work is necessary upon them.

**CONCRETE MOLD FOR SUBWAYS OF CABLE ROADS, DITCHES, ETC.**—Ernest L. Ransome, S. F. No. 353,500. Dated Nov. 30, 1886. This is a mold constructed of any suitable material having a curvature or direction of outline and extent of perimeter at one end conforming to the concrete work to be made, and thence tapering or sloping on its top toward a point. It consists further in an auxiliary or supplementary frame, having at one end a curvature or direction of outline and an extent of perimeter conforming to the excavation to which it is fitted, said frame having a straight top and a bottom sloping upwardly toward a point, being the reverse in construction and position to the mold. The invention consists further in a means for increasing and diminishing the diameter of the mold, and also of the auxiliary frame, when necessary; in adjustable rollers in the mold on which it may freely ride over a plate laid under them; in recesses in the sides of the mold for receiving guides for sustaining bolts, nuts and other forms in position in the concrete until the same become sufficiently set to retain said forms unaided; in a mechanism for changing vertically and horizontally the line of draft of either the mold or auxiliary frame, and in certain details of construction. The object is to provide a mold for easily and rapidly laying the concrete lining for cable roads, ditches, sewers, tunnels and other extended excavations, and holding the excavation in advance of the mold, when said excavation is made in sandy soil, where it would have a tendency to cave.

**RED-LEAD PAINT.**—Experiments made under the direction of the administration of the Dutch State railroads with various paints on iron plates are reported to have proved that the red-lead paints resist atmospheric influences much better than those of brown-red and iron oxides. The red-lead paints adhered closer to the metal and possessed greater elasticity than the others. It was also found that better results were attained if, before the paints were applied, the plates were pickled, instead of being merely scraped and brushed. The test plates were pickled in muriatic acid, washed with water, thoroughly dried, and while warm carefully oiled.

**THE SALMON PULVERIZER.**—We are informed that the owners of the Boss mine, near San Juan, who have one of Forbes' quartz mills, are able to crush about 30 tons of rock in 24 hours, their rock being soft and easily reduced. Taken in connection with the fact that this mill only costs about \$600, and requires but a small amount of power to run it, this showing is remarkable. The Salmon Pulverizer is the name of this mill, and it is manufactured in Downville by Taylor & Forbes.—*Montana Messenger.*

The Anaconda Company is shipping 200 cords of wood daily from Mill Creek to their mine in Butte, and the smelters at Anaconda. The latter consume 100 cords daily.

## USEFUL INFORMATION.

## Making Hard Wood Out of Soft.

A scheme, deemed entirely impracticable, has at last been developed in England for making hard wood out of soft, by compression. We have already alluded to this matter in these columns, and now refer to it again to record the substantial progress which is being made in it.

The London *Engineer* says: "For the manufacture of loom shuttles, boxwood has hitherto been very largely used; but the price has become almost prohibitive, and it has been found that, by the compression of cheaper classes of wood, a substitute meeting all requirements can be obtained. For carrying out this process, Sir Joseph Whitworth & Co., of Manchester, England, have recently completed a powerful hydraulic press to be used in compressing wood for loom shuttles. This press consists of a strong cast-iron top and bottom, with four steel columns and steel cylinder, with a large ram. In the center of this ram is fitted a smaller ram, fitting into a die, which is placed on the top of the large ram. The wood is put into this die, and a pressure of 14 tons per square inch is applied. The top pressure block which fits the die is then removed, and the small ram, rising, pushes the wood out at the top of the die."

The same exchange adds: "The wood thus treated is made very dense and uniform, and so close-grained that it is capable of taking a very high finish. For the manufacture of shuttles it has been found as good as boxwood, and there is no doubt that a similar process might be applied with advantage to other branches of industry where expensive hard woods have now to be used."

There can be no doubt but that wood prepared by some such method will, before long, be employed very generally in carriage building. One has only to read that portion of the lecture by Mr. H. G. Sheppard, of New Haven, Conn., referring to wood similarly toughened, to understand that a remarkable future of the timber trade will some time be opened up by some enterprising wood-bender, who will supply himself with the necessary machinery, accompanied by tests. Mr. Sheppard made the following prophecy. He said: "I want now to show you some timber I have here, which has been so toughened by a new process that you are not likely to recognize it. Here, first, is a piece of whitewood. It is tougher than ordinary ash, and yet whitewood is not considered a tough wood. Here, again, is a piece of ash that has been subjected to the same process. I believe the time will come when our carriage poles will be manufactured out of wood that is to-day considered very common and inferior. This ash is toughened to a degree you can hardly realize. The secret is this: It was toughened by steaming it, and then compressing it endwise. \* \* \* I believe it is perfectly practicable to make even carriage poles out of this same ordinary poplar or whitewood by subjecting it to this, for our high-grade white ash and hickory are becoming very scarce, and, at the present rate of construction, they will soon be used up."

The above account of the Whitworth process and results, already attained, gives promise of a speedy realization of Mr. Sheppard's prophecy.

**FOREIGN MATTER IN BREAD.**—Even in the most ancient times, the *Scientific American* says, different foreign matters were mixed with bread. In Thracia, bread was mixed with powdered dried roots; in Syria, with dried mulberries; in Egypt, with whole grains. In modern times, in Sweden, they add to the bread powdered dried fish; in Ireland and Iceland, moss, which, besides being nutritious, keeps the bread from drying; in Prussia, white clay, which contains alkali salts and makes bread very light; in Russia, powdered bark or finely chopped straw. On the western shore of England a certain kind of seaweed is gathered, washed, boiled, and then baked with oatmeal flour. In Africa, powdered dried locusts are mixed with bread; in India, potatoes and pea flour, and during the famine, stones ground to a fine powder.

**FIRE SMOTHERED WITH SAND.**—Few people are aware how readily an incipient fire may be smothered with sand or dry earth of any kind. An exchange speaks of the explosion of a gasoline stove in an assay office, which set fire to the building. There was no water convenient, but the alarm soon brought numerous anxious neighbors to the scene, and a convenient street full of sand enabled them to subdue the flames before any serious damage was done. A shovelful of sand is a very effective fire extinguisher, especially when oil is burning.

The following, it is said, is an admirable cure for damp cellar walls: Boil two ounces of grease with two quarts of tar for nearly 20 minutes in an iron vessel, and having pounded glass one pound, slacked lime two pounds, well dried in an iron pot, and sifted through a flour sieve. Add some of the lime to the tar and glass to form a thin paste only sufficient to cover a square foot at a time, about an eighth of an inch thick.

A NEW USE has been discovered for potatoes. They can be converted into a substance resembling celluloid, by peeling them, and after

soaking in water, impregnating with eight parts of sulphuric acid, then drying and pressing between sheets of blotting paper. In France pipes are made of this substance scarcely distinguishable from meerschaum. By subjecting the mass to great pressure a substance can be made of it rivaling ivory in hardness.

**ANOMALIES OF SMELL.**—Peculiarities of the sense of smell form a subject of investigation by Arthur Mitchell, of Edinburgh. Among those observed thus far is that of a person who smells nothing from a bed of mignonette, and of another who perceives no odor from a bean field, the sense being otherwise acute and discriminating in both cases. Another person can discover no difference between certain odors which are very different to others; while there are persons who are sickened by certain odors which usually give pleasure. A considerable number of persons seem to be altogether destitute of the sense of smell; and, on the other hand, there are a few who have the sense very strongly developed.

**POWDERED GLASS** is largely taking the place of sand in the manufacture of sand paper. It is readily pulverized by heating it red hot and throwing it into water, the finishing being done in an iron mortar. By the use of sieves of different sizes of mesh the powder can be separated into various grades, from the finest dust to very coarse, and these should be kept separate. A strong paper is tacked down and covered with a strong size of glue, and the surface covered with powdered glass of the desired fineness; when the glue is dry the surplus glass is shaken or brushed off. Muslin is better than paper, and lasts much longer in use.

**KEROSENE OIL STAINS.**—Kerosene oil spilled upon the carpet will often entirely disappear if the room is kept free from dust. If the spot still remains, a thick coating of powdered French chalk put over the spot and occasionally heated by laying a piece of brown paper upon it and passing a hot iron over it will generally remove the oil.

**MAKING SULPHUR JOINTS.**—To mix sulphur for making joints under engine beds, melt the sulphur in an iron ladle in the same manner as with lead; only cover the ladle, while melting, with a piece of iron to prevent fire.

**A NON-CORROSIVE LUBRICANT FOR BRASS.**—An excellent lubricant that will not corrode brass, and will last for weeks, is made of one part of melted india-rubber (not vulcanized) and two parts of common vaseline.

## GOOD HEALTH.

## Art and Science of Eating.

## Rules for Invalids and Harmless for All.

**EDITORS PRESS:**—Allow me to contribute to your health column the following advice in regard to eating: Eat small mouthfuls; masticate thoroughly. Have every particle of food completely comminuted so that the various juices of the mouth and throat shall be completely and thoroughly mixed with every particle and iota of the food. Get every last virtue out of every atom of the nutriment. Then, and then only, is it fitted to be introduced into the stomach. Then the galvanism, the magnetism, the electricity, the life-principle, or some occult, or other unknown, or undiscovered, or unnamed something, is mixed and blended with the food, and the stomach is ready to act upon it without taxing and wearing overmuch its powers. Then the food, after being transformed to chyle, is in proper condition to build up and strengthen the system, with all its powers. Have the variety small at each meal, so as not to over-stimulate the appetite, thus causing excess in eating. Of condiments, relishes, sauces, gravies, butter, meat, spices, fats, eat only the smallest quantity compatible with rational—not excessive—gustatory enjoyment. The enjoyment is just as great in that mode of eating; even greater, as you will have the pleasurable feeling that you are doing your whole duty to yourself. A little self-denial adds to, rather than abstracts from, the pleasures of eating. As above remarked, get all the good out of all the food; and most especially so out of all the relishes, for it is these of which we are apt to partake too freely. Observe great regularity as to times of eating—whether you eat two, three, or even five times a day, eat at these times and at these times only. If, from accident, the time of eating goes by, wait until the next regular time, rather than be irregular in this matter. No matter how great the general variety, the greater the better; eat anything that does not positively disagree with you; only be careful to have each meal simple and of few articles.

Let the last meal of the day be light. If fruit or anything else must be eaten out of the regular meal time, let it be, if possible, near the meal time—just before or soon after, so as not unnecessarily to burden the stomach, which needs its stated rest as much as does the overburdened body. Never overload the stomach; err on the side of too little, rather than too much; then will "good digestion wait on appetite," and the nervous system be in good tone. It is a good rule to get up from the table a little hungry, although a better one is, eat to satisfaction, but never to satiety. Never

eat while laboring under any excitement. The stomach needs all the powers of the mind as well as of the body for a time. When its labors are finished, that, too, can take a rest, while the body and mind may perform with health and vigor their allotted tasks. S. P. SNOW.

**HINTS FOR FAT MEN.**—The American, relieved of the onerous duties of settlement life, has long since ceased to be the lean, cadaverous dyspeptic that he was pictured to be. His Anglo-Saxon blood is beginning to manifest itself in the storing up of tissue. In other words, he is John Bull's unmistakable offspring, and the old gentleman's paunch is beginning to show on him. The American of both sexes and of all conditions is certainly getting fat. Neither of them likes the new contour, and hence the popularity of the scores of systems for reducing corpulence. A good weight at maturity is not unhealthful. Even a superabundance of tissue is not a serious disadvantage. As age approaches after a certain point it will begin to disappear naturally, but it is unsafe as well as painful to attempt to remove it by medication or any other process beyond what a fair amount of exercise will do. Rapid reduction of weight involves a corresponding depletion of the system, a decided lowering of vitality, a larger predisposition to disease and a pretty sure invitation to consumption. Let the fat stay; it will do less harm than drugs.

**TO REMOVE A SPECK OR AN EYELASH FROM THE EYE.**—This, we all know, requires the aid of a looking-glass, or the kindly hand of a friend, whether in or out of the house, but there are times when neither of these helps is near; so Nature has provided that, if we will use her appliances, she will assist us, and with a little practice it will be found the best and quickest in the end. The upper and lower eyelashes are given us as a protection to the eyes, but they also serve as little brushes when an accident happens. By taking the upper eyelashes between the thumb and finger, and drawing the lid completely over the under eyelashes, and gently moving it backward and forward, any specks in the eye fasten on to the lower fringe and remain there after having let go of the upper. This is a sure plan, and can be adopted anywhere, but it requires some perseverance to acquire it, and should not be given up if the first attempts are unsuccessful. Any disagreeable feeling about it is not half so painful or dangerous as is occasioned by the smallest speck.

**THE DIET OF STRONG MEN.**—The Roman soldiers, who built such wonderful roads and carried a weight of armor and luggage that would crush the average farm hand, lived on coarse brown bread and sour wine. They were temperate in diet and regular and constant in exercise. The Spanish peasant works every day and dances half the night, yet eats only his black bread, onion and watermelon. The Smyrna porter eats only a little fruit and some olives, yet he walks off with his load of 800 pounds. The coolie, fed on rice, is more active and can endure more than the negro fed on fat meat. The heavy work of the world is not done by men who eat the greatest quantity. Moderation in diet seems to be the prerequisite of endurance. It is not so much what people eat as what they digest that makes them strong. It is not what they gain but what they save that makes them rich. It is not what they read but what they remember that makes them learned. It is not what they profess but what they practice that makes them righteous.

**IN THE ELEVATOR.**—An intelligent physician says: "It is a good rule always to ride up in an elevator, and when coming down to take the stairs. Like going uphill, walking upstairs is hard work, and sometimes risky, especially for people with weak lungs, defective respiratory organs or heart disease. But going downstairs hurts nobody, but is good exercise; going down on a brisk run is really a good thing—it shakes up the anatomy, without incurring the danger of physical over-exertion. This shaking up is good for one's internal mechanism, which it accelerates, especially the liver, the kidneys and the blood circulation."

**MILK IN ARSENIC POISON.**—Dr. Joseph Jones, of New Orleans, recommends, as the result of his observations, the drinking of large quantities of milk as a quick antidote in cases of arsenical poisoning. His observations are based upon 13 cases, all of which recovered. According to his theory, the milk dilutes the poison, incloses it within its coagula, protects thus the coat of the stomach, and, if the stomach is in condition for absorption and digestion, it forms an aliment of the highest order.

**LEMON FOR THE HANDS.**—Lemon is always good for the hands; it cleans them as well as soap and makes them soft. You should clean the nails with a brush if necessary, but it is better to rub the fingers and nails with a half of a lemon, thrusting the fingers into it and turning it until the nails are perfectly clean. Lemon will likewise prevent the skin at the root of the nail from growing upward.

**PASTEUR'S CURE FOR RABIES.**—During the 12 months just expired M. Pasteur applied his preventive cure of hydrophobia to 3490 patients, most of whom had been bitten by dogs undoubtedly mad, yet of that large number only 10 succumbed to the disease for which they were treated.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**MINES BONDED.**—*Ledger*, Dec. 11: On Saturday last ex-Governor Hale, one of the stockholders in the South Spring Hill mine, bonded the Comet mine, from Mrs. Mahoney, of Sutter Creek, the bond running for the period of one year. The Comet is situated on the ridge between Sutter creek and Amador City. The work of developing the property will no doubt be pushed forthwith. On Monday last, Mr. Bryan, on behalf of a company of San Francisco capitalists, bonded the North Star mine, situated south of the South Spring Hill mill. The purchase price agreed upon is \$27,000, payable in one year. The bond stipulates that work must be commenced on the property within 60 days from date, and that a stoppage for 30 days works a forfeiture of bond, and all money paid thereon. The North Star is considered a flattering prospect, although the work of development consists in a shaft only 50 feet deep. From the adjoining claim, the Wabash, rich stringers of quartz have been followed toward the North Star property, creating the belief that a well-defined ledge exists in that mine. The company that has bonded it is possessed of ample means, and will undoubtedly test its value within the life of the bond.

**SALE OF A MINE.**—*Col.* W. T. Robinson has sold within the past week the Middle Bar Gold Quartz mine, to a company of Eastern capitalists, who will soon erect works on it. This claim is considered to be one of the best prospects for a big mine in Amador county.

## Calaveras.

**MINES AND MILLS.**—*Angels Echo*, Dec. 10: Mining operations in this section have commenced for the winter's run with an earnestness that betokens activity and prosperity. The Stickle mine is running full-handed night and day. Stopping in the north and south end is being carried on vigorously. The principal part of the rock which is being milled at present is taken from the north end, and is pronounced to be of a high grade. It is expected that the next cleanup will be an enormous one. The mine is very dry for this season of the year, the flow of water being so light as to necessitate but little pumping. The mill, of 20 stamps, is kept in constant motion. The future outlook of this mine is very flattering. The Utica mine, situated a short distance north of the Stickle mine, is also running in full blast night and day. Stopping is being prosecuted in the north and south end with considerable energy, the greater part of the ore being extracted from the south end. The ore is of a very high grade and as developments are gradually made the ore increases in richness. Considerable comment has been made by disinterested parties regarding the safety of this mine, owing to the large caves that have taken place at intervals in the old works. We are informed upon reliable authority that the old works are now completely filled and that no further settling of this ground is anticipated in the future. During all this disturbance the mine proper was not in the least affected. The chasm that has been opened by the caves is being promptly filled by a force of men employed on the surface. The mill is kept in motion night and day, and judging from the heavy coating of the plates, an immense yield will be the result of the present run.

**GOOD ROCK.**—*Calaveras Chronicle*, Dec. 11: We were shown some very rich rock last Monday, which was taken from the lead near Glencoe, and owned by J. H. Reed, of this place. The rock carries free gold and also abounds in rich sulphurets. The rock shown us prospects at the rate of \$40 per ton, and the vein averages four feet in width.

**WEST POINT.**—*Cor.* *Calaveras Chronicle*, Dec. 11: At present all the principal mines of this little burg are paying large dividends and running at full blast. Among the principal mines are the Lockwood, Peasley, Scorpion, Water Lily and the Star of the West. Of the above-named mines there is not one that yields ore but what will average from \$95 to \$120 per ton, and sulphurets as high as \$300 and \$400 per ton. There are several other mines in progress, but running on a smaller scale. The Peasley mine is richer at present than it ever has been before. This, no doubt, will prove to be the best mine in the county. The mines of this place have never before produced as much valuable ore as at present. Jake Morris & Co. are making preparations for constructing machinery on their mine, known as the Mountain Lion. New machinery is being put up on the Sawyer mine. If the mining boom of this place continues in the future as at present, and there is no doubt but what it will, West Point will be the metropolis of Calaveras.

**THE JONES MINE.**—We are informed that Senator Jones will crush 200 tons of ore from the Jones mine, situated at the mouth of Carson creek, in the Marshal mill at Altaville, having made arrangements to that effect. The mine has recently been pumped out and the rock will be extracted at once for the purpose of making a thorough test of its metalliferous properties. The ore of the Jones mine is silver-bearing. The ore body of this mine is about 50 feet in width. Should the test that will soon be made prove satisfactory, immense reduction works and other necessary improvements will be erected upon the mine, and developments on a large scale immediately follow.

**AT THE TOZER MINE.**—Improvements have been in progress during the past two weeks. The shaft has been repaired and quite an addition built on the east end of the hoisting works. Ever since operations ceased at this mine the works have been kept freed from water, steam having been generated tri-weekly for that purpose. We were informed at the mine that work would commence some time next week.

**AT THE LINDSAY MINE.**—The shaft and levels of this mine are being timbered and put in excellent condition for the winter's operations.

**THE GOLD CLIFF MINE.**—This mine, situated about half a mile west of town, will not resume operations until after the next rain, everything being in readiness to start up immediately thereafter.

## El Dorado.

**CHILI RAVINE.**—*Placerville Observer*, Dec. 14: Among the most recent mining developments undertaken in this section is that at Chili ravine. Many years ago this mine was worked with good results by Goyan, Gluyas & Co., but after penetrating the hill for about 900 feet they were driven out by water, and the mine has been allowed to lie idle for years. Recently it came into the possession of L. L. Lewis, of Sacramento, and systematic work was begun under direction of Dan Coffin, one of the most experienced gravel miners in the State. The lower tunnel, which is calculated to not only assist in opening up the property, but will serve to drain all the upper ground, has been run about 650 feet, and the gravel therein, which is found in abundance, prospects from 25 cents to the pan upward. A fine 10-stamp mill has been erected, which was started up last Tuesday, and we miss our guess if the Chili Ravine does not prove the best paying gravel mine in the county, and that right away.

## Inyo.

**PANAMINT.**—*Inyo Independent*, Dec. 11: Last Monday White Smith arrived at Independence from Panamint. He reported that there is a lot of machinery, some lumber and other stuff at Keeler for Panamint. His team will haul and deliver this and will then be withdrawn. All the additional machinery, lumber and whatever else may be needed for rebuilding the works at Panamint will be collected at Keeler in readiness for teams to begin hauling again about the beginning of next March. When the work is resumed, it will then be pushed with vigor to a finish.

**LOOKOUT MINES.**—Mr. Frank Fitzgerald writes that the Modock group of mines and his own mines at Lookout are looking and doing well. The only drawback to the mines is the lack of good miners. Men are plentiful enough, but miners are scarce. Out of 29 men who applied for work during November, only nine were miners.

**DARWIN.**—Jack Wilson arrived in town from Darwin, last Thursday. He says the mill at Coso will be finished and running by Christmas. There is plenty of good gold ore in sight.

**GRAVEL.**—It is reported that a rich gold gravel bed has been found on the west branch of the Walker river, above Antelope valley. If the strike is as rich as reported, it will make good times for the farmers of Mason valley. The Defiance mine at Darwin is looking better than ever; the ore body on the lower level gets bigger as it is opened. Work there, as in all the mines about Darwin, is hindered for want of more good miners. Skilled miners are wanted there and would find steady employment.

## Nevada.

**ORE TO BE CRUSHED.**—*Foothill Tidings*, Dec. 11: There is considerable rock on the dump at the Peabody mine awaiting an opportunity to be crushed. This ore, together with considerable more, will be hauled to Patrick Riley's mill and crushed. It is estimated that the rock will pay well. If the miners have no bad luck in the Peabody, ore will be regularly milled.

**ROCK FROM THE PENNSYLVANIA MINE.**—Last night the miners working in the shaft of the Pennsylvania got into some extra good ore. The ledge on the trend of the shaft where this rock was taken from is about 250 feet from the surface. The ledge there is about 20 inches in thickness, and is all milling ore of good quality, while that brought to town and lodged in Byrne's drug store is of extra value, being prominent in free gold and abounding in other gold-bearing metals. A crushing of 30 loads will be hauled to the custom mills next week. The Pennsylvania is going steadily and surely along.

**QUARTZ MINING SALE.**—*Grass Valley Union*, Dec. 11: Messrs. Abbott & Hewitt, who have been prospecting in quartz for some time, on a ledge about three-fourths of a mile beyond Rough and Ready, have disposed of a one-half interest in their claim to Grass Valley miners. The ledge has not been worked to a great depth, but it shows in good size and regular between its walls. Cravings of the rock made by custom mills here gave a result of \$25 per load, which was sufficiently satisfactory to the purchasers to induce them to buy a half interest in the claim. The work on the mine is to be prosecuted diligently under the new partnership.

## Placer.

**GOLD BLOSSOM.**—*Placer Republican*, Dec. 8: The old Gold Blossom mine on the Lincoln road, below Ophir, which was idle for so long, is now a place of considerable activity. Last summer it was leased by E. L. Hubbard, Dr. E. T. Wright and Mr. Morse for a term of five years, with the privilege of purchase. Mr. Hubbard put everything in thorough repair and working order. The 10-stamp mill was refitted, the shaft of the mine cleaned out, and enough wood to last a year was hauled to the mine and placed under cover. A prospecting shaft on the Marion ledge was sunk as deep as it could be profitably with a whim. The Marion is supposed to be a branch of the Gold Blossom, and joins it at an acute angle, a short distance west of the old shaft on the latter. Water was brought to the mill through a pipe from the Bear river ditch, and crushing commenced a few weeks ago. The Gold Blossom ledge is as distinct and well defined as the old St. Julian below Newcastle. It has been worked to a depth of 20 feet, and for the greater part of that distance the walls of solid country rock are about three feet apart and perpendicular. Between them is the ledge of gleaming quartz, the most of which carries much silver and is rich in gold sulphurets. It would be very valuable if all the mineral could be easily saved, but it is refractory like much of the Ophir quartz, which is characterized by a peculiar combination of iron pyrites, gold sulphurets and silver. So far, however, the lessees of the mine are well satisfied with their venture. They have made a cleanup, after a crushing of 190 tons of the second quality rock from the mine, which resulted in eight pounds of bullion, besides a large quantity of sulphurets which yet remains under the two Frue concentrators. They are sacking the best of the rock, and will ship it to some reduction works to have it worked. Samples of the sulphurets and some of the best ore were recently sent East to be assayed. The result was as follows: Sulphurets, \$46.18 in silver and \$35.16 in gold; ore, \$565.10 in silver and \$20 in gold. The ore is cheaply mined and milled, and there is a prospect that it will pay handsomely. The Gold Blossom is like many

another claim in and around Ophir—they would be bonanzas if there were good reduction works in the district capable of saving all of the precious metals contained in the quartz.

**HUNTINGTON MILL.**—*Cor.* *Placer Herald*, Dec. 11: A few days ago a Huntington quartz mill boiler was taken through town on the road to the Lynn quartz mill near Damascus. It will not be long before the mill will be in good working order. From all accounts the ledge looks well.

**GOOD ROCK.**—*Cor.* *Placer Herald*, Dec. 11: L. R. Colgrove and C. Curran, of Dutch Flat, have evidently made a rich find. They are the owners of a quartz ledge, located about seven miles south of Emigrant Gap, near Texas hill. A few weeks ago they struck rich gold-bearing rock, and after prospecting along the surface for a distance of 170 feet, they found rich rock throughout the entire distance. They have a tunnel run in the hill about 150 feet below the surface of the ledge and have struck rock-bearing galena. It is thought by the owners that by running the tunnel in 150 feet further, rich rock will be struck. The ledge is situated in a bed of porphyry and is four feet in thickness. Some of the rock taken from the top prospects immensely.

**QUARTZ MINING.**—The old St. Patrick, the Doig and the Boulder quartz mines, all within a short distance of one another, on the hill north of Ophir, are running steadily, and all are taking out ore. The latter has its own mill and crushes its own rock, while the first two are having their ore crushed at the Lavelle mill, near Ophir. The Doig and St. Patrick have yielded some fabulously rich rock lately, and the Patrick, we understand, is still panning out well, while the Doig, report says, is not showing up so encouragingly as it has done in the recent past.

## San Bernardino.

**MESCAL DISTRICT.**—*Calico Print*, Dec. 12: Your Occasional visited the Mescal mining district a few days ago. The 5-stamp mill of the Cambria Co. was pounding away on some fine ore. The company is represented by Mr. L. W. Carr as superintendent. Messrs. McFarlane & Barrett, who sold the property to the present lucky owners, have been retained by the company. Sim A. Barrett has charge of the opening of the mines, and W. A. McFarlane as millman. Four bars of bullion had just been run out, the lowest being 938 and the highest 995 fine, showing that Mr. McFarlane keeps up his reputation as a first-class millman. The four bars represented about 5000 ounces of bullion. The mill is now running in splendid style. Mr. Carr has shown that he has gone there to stay. The mill is a thoroughly substantial one in all its parts. They have a fine assay office, overseen by the painstaking assayer, Mr. L. A. Blackburn. The offices are comfortable, and the boarding-houses, lodging-house, etc., show that they look to the comfort of their men. The mine shows ore enough in sight to keep their present reduction works running at least two years. No ore has been stoped below the first level and not one-half of that. The second level is about 125 feet on the vein below the first. They are now running in as good ore on that level as on No. 1. The quartz is hard but the ground good. The company pays \$3.50 per day for good miners, and excellent board is to be had at \$8 per week.

**JENNIE LIND MINE.**—Another claimant to the now locally famous Jennie Lind mine has loomed up. While claimants are springing up and the air getting blue with litigation around it, the mine is being vigorously worked by the lessees, who are taking out a large quantity of rich ore, and are trying to "make hay while the sun shines," for their leases expire on Jan. 1st. To facilitate the transportation of the ore to the mill, Allyn, Madison & Co. have graded a road along the hillside to the spot where the Harwood boys are working, and have also built a small tramway and chute to convey the ore to the road, where it will be taken by the teams. At present there are no signs of the ore giving out. Whitton, Cochran & Boyle are doing well on the Comet, and realizing a profit of about \$30 a day from their ore returns. This mine has yielded considerable ore in the past, and from present appearances it still contains large deposits of rich ore. J. R. Lane and J. R. Stevens have a lease on the Josephine and are making wages with a good prospect of striking it rich, as there are indications of ore deposits in the mine of a high grade. At different times a large quantity of ore has been taken from the mine and milled at a good profit.

## Shasta.

**SYBIL MINE.**—*Democrat*, Dec. 8: This mine consists of four claims, the Sybil, Rosa, Stuart and Young Banghart, each 1500x500 feet. It has been worked with flattering results for several years. It lies partly in Trinity and partly in Shasta counties, the dividing line passing through near the western end of the claims. The reduction works, by which the ore has been formerly treated, was an arastra, but recently a Huntington mill driven by water power has been constructed. The mine has been recently bonded and leased to Martin Jones, of S. F., who is now opening the mine at greater depth. He has now obtained a vertical depth of 252 feet, at which point good ore is being extracted, and a still deeper tunnel is being pushed ahead, now in 96 feet, which will soon cut the vein 125 feet deeper. Ore is free, containing a fair percentage of sulphurets. Timber and water are both abundant and convenient, and several hundred feet of additional depth can be easily obtained by short tunnels.

**JOHN TIFFIN'S LUCK.**—*Republican Free Press*, Dec. 11: That old pioneer miner, who, with undaunted pluck and sublime patience, for the past 34 years, pursued the fickle goddess Fortune in the bowels of the earth, has at last discovered what promises to be a valuable mine. We refer to John Tiffin. John, for several months, has been developing an extension of the Muchmore mine in the Lower Springs district, and has at last tapped a well-defined ledge of rich ore four feet wide. It promises to be equally as good as the Muchmore, which is now acknowledged to be a valuable mine.

## Sierra.

**TUNNEL.**—*Mountain Messenger*, Dec. 11: The Good Hope tunnel is going ahead very rapidly, and will be into the ledge about March, if nothing hinders. The water is now coming from the bottom and sides of the tunnel instead of the top, which enables the men to make better progress. D. L. Whitney has several men at work running a tunnel on a quartz ledge which crops out about half-way up the hillside above Frank Beaver's old place, along-

side of Hog canyon trail. He has a tunnel in about 200 feet, and the quartz all prospects. It is on a direct line between the Primrose, in Hog canyon, and the Cleveland ledge, on the south side of the river, and is probably the same ledge. P. Lamping came down from Hog canyon on Wednesday, on his way below. He reports that a contract has been let to run the tunnel from the bottom of the shaft ahead to the ledge. Since the contract has been let, it has been discovered that a tunnel had been run from the upraise, made from the tunnel by a former prospector—had been run to the ledge, and that the chute contained many tons of good rock, not a pound of which has ever been worked. The mill will be started up early in the spring, by which time the lower tunnel will be into the pay chimney, and rock can be taken from both openings if deemed necessary.

## Tuolumne.

**CHINESE CAMP.**—*Tuolumne Independent*, Dec. 11: Operations have commenced on the Willietta mine during the past week—Messrs. Long & Hampton having sold an interest in the mine to some foreign capitalists. The mine is situated above Jacksonville, and has a fine body of low-grade ore in sight. The new owners will increase the stamps at the old mill, and with the new machinery which they will put in operation, feel confident of an increased yield over the old methods.

## NEVADA.

## Washoe District.

**CON. CALIFORNIA AND VIRGINIA.**—*Virginia Enterprise*, Dec. 3: Daily yield about 420 tons, shipped to the Morgan and Eureka mills, on Carson river, for reduction, the largest portion going to the Eureka. The assays from mill battery samples have fallen down a little, averaging below \$40 per ton. On the 1650 level the regular ore yield continues undiminished from the various breasts and stopes. The drift southwest from the C. and C. shaft is 580 feet in length, 18 feet having been added during the week. On the 1500 level the lateral drift north from the Consolidated Virginia shaft has been advanced 53 feet, making a total length of 321 feet. Face in low-grade ore, but improving with further advancement. On the 1435 level a winze is being sunk at an eligible point next to the east clay wall, a small hoist engine being set up for the purpose. On the 1400 level the winze being sunk below the track floor of the south drift, to connect with the south drift on the 1500 level, has nearly reached the desired connection and has passed through some very rich seams of ore. It is 300 feet south of the old Consolidated Virginia shaft. On the 1300 level the drift being run north from the Consolidated Virginia shaft is 456 feet in length, 47 feet having been added during the week. This drift has passed through 10 feet of good paying ore, with a considerable amount of low-grade ore on each side of it. Less than 100 feet will carry it to a connection with the upraise from the 1400 level, establishing a good air circulation and giving better advantages for further explorations and developments.

**SAVAGE.**—On the 500 level east crosscut No. 1 was extended 20 feet, when a seepage of water coming in at the face was encountered. West crosscut No. 1, opposite the above-mentioned crosscut, has been advanced 25 feet, and continues in good ore. On the 600 level the main south lateral drift has been extended and timbered 35 feet, and about 40 feet farther should take it to connection with the main Savage shaft. The double compartment winze being sunk in the ore body below the track floor of this level is in good ore. On the 1640 level, just above the Sutor tunnel, some very excellent ore has been exposed in the large body of quartz at that point and eastward.

**SILVER STAR.**—This is the first extension south of the old Santiago mine, now incorporated under the Quinn relocation as the Hayward. The Silver Star is owned by Silver City and Virginia parties. They sunk a shaft 50 feet deep and drifted on the ledge, finding it about two and one-half feet wide. Since then they have sunk 30 feet deeper and find the ledge about four feet wide. They have had three lots of ore crushed at the Thompson mill, Lower Gold Hill, yielding from \$18 to \$35 per ton, and having got the company incorporated in good operative shape and listed in the Stock Board, they propose working the mine for all it is worth. The bullion yield thus far has been in the proportion of 60 per cent gold to 40 per cent silver. It is free milling ore.

**HALE AND NORCROSS.**—All the working compartments of the main vertical shaft are now in a good state of repair, from the surface down to the 1300 level, where the shaft merges into the incline. New guides have been put into the north hoisting compartment throughout. On the seventh station the main west drift has been extended and timbered 30 feet, making a total distance from the shaft of 67 feet. Lateral drifts north and south from this main west drift have been started, and are well advanced. On the second station level, the main west drift has been cleaned out and retimbered for a length of 90 feet, making a total distance from the shaft of 120 feet.

**POTOSI.**—On the 250 or old Potosi tunnel level, the chambering out for the winze below the track floor of the northeast drift, in the ore body shown at that point, is not yet completed. This is near the Chollar south line and known as the north winze. In the splendid ore body developed by the north-west drift, 300 feet south of the Chollar line on the same level, the chambering out for the winze to be sunk below the track floor to explore the depth of the ore body is completed, and the sinking of it will be practically commenced to-day.

**BEST AND BELCHER.**—On the 800 level east drift No. 1, at the north boundary line, was advanced 41 feet, making a total length of 111 feet. Material, favorable vein porphyry. On the 1500 level the station is being repaired and put in first-class shape for active work and practical development.

**GOULD AND CURRY.**—On the 425 level the south drift from the main west drift has been extended 41 feet, making a total length of 314 feet. This drift has been cleaned out and thoroughly repaired for that distance. Material in face, clay and porphyry, with increasing quartz seams. The main shaft of the mine is being put into a thorough state of repair, and both north compartments are being put into complete practical working order, while the

hoisting goes on through the south compartment.

**OPHIR.**—On the 1065 level the south drift started from the shaft station is making good progress in favorable ground. On the 1300 level, east crosscut No. 1, 200 feet north of the Ophir shaft, is being energetically pushed ahead toward a very promising section. This level of the Ophir corresponds with the 1435 level of the Con. Cal. and Virginia.

**OCCIDENTAL.**—From the old north upraise of the two connecting the upper and lower tunnels, a lateral drift is being run along the ore vein 48 feet below the track floor of the upper tunnel. In the lower tunnel upraise No. 2, 50 feet south of upraise No. 1, has been commenced. The north drift from the incline winze, 10 feet above the lower tunnel, has been discontinued.

**CHOLLAR.**—The repairs and regeneration of the old shaft are making good progress. A lateral drift north from the shaft on the 350 level, which was in ore the first of the week, ran out of it, and was turned to the northeast, but soon ran into clay and porphyry, therefore it was abandoned, and operations resumed in the face of the drift north.

**ALPHA AND EXCHEQUER.**—All work is confined as yet to getting the surface machinery placed in working position at the old Alpha shaft, through which both mines are to be further developed in their upper departments.

**ALTA.**—On the 700 level the drift south following the east side of the old Keystone ledge is out of the Benton and into Alta ground. The winze sunk below the track floor of west crosscut No. 2 is down nearly to its proposed connection with the 800 level, and continues its showing of bunches and streaks of good ore.

**ANDES.**—On the 230 level the main west drift has been put in a state of thorough repair to the distance of 600 feet, at which point quite an extent of caving ground is met with, requiring considerable work to catch up, remove and retimber.

**CROWN POINT AND BELCHER.**—The ore stopes and chambers on the 1600 and 1700 levels, as well as in some of the old sections above, hold out finely, giving their regular daily output of 380 tons, keeping the mills steadily supplied.

**JUSTICE.**—Running the drift from the old Woodville shaft into the southern portion of the mine progresses. It is simply a low-grade ore proposition, with hopes of something better.

**KENTUCK.**—The daily yield is about 60 tons of low-grade ore from the 800 and other upper levels. The old ore resources hold out well, and bid fair to do so for years to come.

**SIERRA NEVADA.**—On the 520 level west crosscut No. 5, from the north lateral drift, was advanced 29 feet, making a total length of 294 feet. Material, principally birdseye porphyry.

**BULLION.**—The cleaning out and repairing of the old Croesus shaft goes ahead, and the low-grade ore proposition will soon be reached.

**YELLOW JACKET.**—About 150 tons per day of low-grade ore continues to be the daily output, keeping the Brunswick mill well supplied.

**UNION AND MEXICAN.**—Operations are confined to advancing the joint north lateral drift on the 1300 level and the crosscut east from it.

**OVERMAN.**—Overhauling the hoisting machinery at the old shaft is what is being done at present.

#### Bartlett Creek District.

**A PROSPECT FOR A REVIVAL.**—*Silver State*, Dec. 11: There are some evidences of a revival of interest in the Bartlett Creek mines. Frank Raymond, just in from there, says some prospectors have arrived in the camp, and there is a probability of something being done to develop the mines this winter or next spring. When the district was organized, some years ago, the rich gold-bearing quartz found on the surface created considerable excitement, and attracted a good many people to the place. Several loads of the ore were brought to the Humboldt Reduction Works here, and yielded handsome returns, but the camp, like Spring City and other places in which mines were afterward shown to exist, was abandoned, and probably will not amount to much until a McCurdy or Ross gets interested in them.

#### Cortez District.

**RUMORED MINING SALE.**—*Silver State*, Dec. 11: It is reported in Eureka that E. N. Robinson, of the Sweetwater Mining Co., of Hamilton, White Pine county, has bought the Wenban mining property at Cortez. Mr. Robinson has just returned to Eureka from Cortez.

#### Eureka District.

**ORE SHIPMENTS.**—*Sentinel*, Dec. 12: During the past week ore shipments were made from the mines of the district to the two reduction works in town as follows: To the Richmond Works—White Pine mine, 5 tons; Sanchez, 1½ tons; Williamsburg, 2 tons; Member, 23 tons; Antelope, 36 tons; Eureka Tunnel, 7 tons; Dunderberg, 67 tons; King Lear, 1½ tons; Silver Lick, 21 tons. To the Eureka Con.—Alexandria mine, 30½ tons; Silver King, 8½ tons; Morey, 8 tons; Wm. Schenck, 7½ tons; Woodchopper, 3½ tons.

#### Hawthorne District.

**THE GOLDEN LAPANTA.**—*Walker Lake Bulletin*, Dec. 11: From all parts of the coast come reports of good mines and favorable prospects, but no district has yet shown a mine equal in all respects to the Lapanta. Many show small bodies of very rich ore that are soon exhausted. Many show large bodies of ore that have required years of labor and vast sums in discovery and working, but no district has yet shown a mine which began paying at the surface and never ceased not simply paying but improving. Necessarily, work was begun on a small scale, but during a little over a year of operation, \$70,000 has been produced, over one-half of which has been profit. This profit was made in the face of the extraordinary expenses attendant on operations in a new district and inseparable from working a mine previous to proper development. Notwithstanding all disadvantages the mine paid a steady profit, and now with good development greatly improved facilities and large quantities of rich ore in sight, there is a golden future before the Lapanta. The quantity and quality of ore have both improved and the cost of reduction has been so reduced by recent work that both total production and percentage of profit will be vastly increased. Heretofore, anything un-

der \$50 has been left in the mine, and this low-grade reserve is now there in immense quantities to add to the sometime future output. Beginning at the surface, this ore body has been worked continuously for more than 800 feet, the rock taken out averaging over \$100 a ton in clean gold, and now with the recent developments in sight it would seem that the history of the mine as a bullion producer is but beginning. There are good mines in other districts, but the Lapanta is alone on the list of mines that have paid since the first pick stroke and always exhibited larger reserves as ore was extracted.

#### Mount Rose District.

**PARADISE VALLEY M. Co.**—*Silver State*, Dec. 14: Mill work—Three Huntington centrifugal roller mills; six Triumph concentrators. Mill run 190½ hours; worked 144 tons. Concentrates produced, 420 sacks, 35,470 pounds, of the par value of \$9419.43, which was shipped to Boston and Colorado Smelting Co., Argo. Number of men on pay-roll, 104.

**NOYES.**—The ledge still holds in No. 5 face, but is quite barren, the small bunches of milling ore having disappeared entirely. All going usually well at the mill and mine.

#### Ophir Canyon District.

**OPERATIONS PUSHED.**—*Belmont Courier*, Dec. 11: Operations in the Chicago Mining and Reduction Co.'s mine, Ophir canyon, under the management of Supt. T. A. Oliver, are being pushed steadily ahead. The production of ore is undiminished and a sufficient quantity is easily extracted to keep the mill running steadily. The bullion output is regular and good.

#### Philadelphia District.

**EL DORADO NORTH.**—*Belmont Courier*, Dec. 11: County Auditor and Recorder W. F. Leon is working on the El Dorado North mine. He is satisfied that as soon as this mine is properly opened, rich and extensive ore bodies will be uncovered. He feels confident that there are millions of dollars in this mine, and its neighbor—the El Dorado South. In the early days of mining in Philadelphia district, Mr. Leon took several hundred thousand dollars worth of ore out of the outcrop of the El Dorado South.

#### Spanish Belt District.

**BARCELONA.**—*Belmont Courier*, Dec. 11: Work is still pushed vigorously in the Barcelona mine at Spanish Belt. Some high-grade ore is being taken out and shipped to Reno for reduction.

#### San Antonio District.

**ASSESSMENT WORK.**—*Belmont Courier*, Dec. 11: Several men are busy doing the assessment work on the mines of San Antonio district. The ore in some of them is of a very high grade.

#### Star District.

**AN ANTIMONY MINE.**—*Silver State*, Dec. 9: Thomas Bray, who arrived in town yesterday, says there are four miners at work on the Trinity mine at Star extracting antimony ore. The mine was leased some time ago by Squire Brown, of Unionville, who pays a stated price per ton for extracting the ore, a carload of which will be shipped from Mill City to San Francisco in a few days. The ore carries a high percentage of antimony and some silver.

#### Tuscarora District.

**BELLE ISLE.**—*Times-Review*, Dec. 10: Line crosscut west has been extended nine feet. Crosscut east, same level, is in very hard rock, and progress is slow.

**TORNADO CONSOLIDATED.**—Last week we made better progress in tunnel, advanced six feet. Have finished a commodious blacksmith shop and covered entrance to tunnel. Contractors have commenced to sink a winze on a vein of sulphuret ore, giving fair assays.

**NAVAJO.**—South drift on east vein, 350-foot level, has been extended a total distance of 81 feet. Winze on west vein from east lateral vein, 350-foot level, has been sunk 35 feet.

**NORTH BELLE ISLE.**—North gangway on the 300-foot level has been extended 50 feet the past week. There is an increased flow of water. A portion of the drift requires to be timbered.

**NEVADA QUEEN.**—During the week No. 1 shaft was sunk 15 feet; total depth, 28 feet. Rock continues hard blasting; water increasing as depth is attained. East crosscut was driven 10 feet to the foot-wall. Work stopped at this point and the men put back in the north gangway, which was driven 19 feet. South drift from No. 2 shaft has been advanced 26 feet. The vein has been broken up, but looks like coming in regular, as the ore is showing again in face of drift. Several loads of shaft timbers arrived this week.

#### Union District.

**RICH STREAK.**—*Belmont Courier*, Dec. 11: There is a very rich streak in Cirac's North Belle gold mine, Grantsville. It is expected that capitalists will take hold of it and open it up in good style. There are several locations that show free gold in Union mining district—and they will be worked in the not very distant future.

#### ARIZONA.

**PURCHASED.**—*Prescott Courier*, Dec. 7: A Mr. Jones has, it is said, purchased the Groom Creek mill, also several Groom Creek district mines. He is negotiating for others. Groom Creek district is about six miles south of Prescott and is well watered and timbered. Its ledges carry gold and silver in paying quantities. A gentleman who is well posted on its gold mines assures us that there are hundreds of tons of rock in sight that will yield from \$10 to \$40 per ton, and we have seen a great deal of rich silver ore there. Its mines have been held by people who were unable to work them properly. These people have always been willing to turn them over to capitalists, for reasonable considerations, and it pleases the *Courier* to learn that the turning-over process is now going on. Negotiations are also pending for mines in Walker and Hassayampa districts, and we really believe all negotiations will lead to purchases and production of bullion.

#### IDAHO.

**THE WEST CAMAS.**—*Wood River Times*, Dec. 8: The West Camas, on the Gold belt, has been bonded to Capt. T. W. Buzzo; the bond being only

for 30 days, and the bond a man who stands well with investors, the transfer will probably be made. The price is somewhere between \$10,000 and \$20,000, and the cash must be paid by the 2d of Jan., 1887, time being of the essence of the contract.

**ERA.**—Although Era is snowed in, it is by no means snowed under. The work of development goes steadily on, and the latest strike is reported from the Rustler, a mine situated on Lava creek. It is owned by Jack Voss, formerly of Hailey, and is a probable fortune to him, as the rock is said to be worth from \$4000 to \$5000 a ton. M. C. Thumb, secretary and manager of the Bannock Co., is pushing work vigorously on the Horn Silver.

**HARTSFELD FURNACE FAILURE.**—*Coeur d'Alene Record*, Dec. 7: The Hartsfeld smelting process is not considered an utter failure, although the Milo works have been fairly weighed in the balance and found wanting. It is believed that serious troubles with the valves and furnaces can be remedied to a large extent if not entirely by reconstruction. Nothing further is likely to be done with the Milo plant this winter.

#### NEW MEXICO.

**WORKING.**—*Black Range*, Dec. 10: Kingston's mines and mills are working day and night, and a flood of gold and silver is pouring out to enrich her people. The development of the North and South Percha districts will double the present output of Kingston before the end of another year. Capt. Cooney is about to commence on a 1200-foot tunnel, which will be driven in the mountain. The work will be done with a diamond drill. Socorro smelters officially report their bullion output for the month of November at 1007 tons, being an increase of some 600 tons over the same month last year. It is said that the Hillsboro stamp mill is now in the hands of the English syndicate who are said to have recently purchased the Lady Franklin group of mines, and has been thoroughly overhauled and repaired for future use.

#### OREGON.

**WATER.**—*Jacksonville Times*, Dec. 12: Most of the miners of Josephine county have plenty of water now and are making the most of it. Nearly all of the hydraulic mines are being worked, and some ground-slucing is also going on. Wm. Huggins and Phil Miller will operate John Miller's extensive diggings on Farmer's flat during the present season. John O'Brien has rigged up his mines in the Steamboat district in first-class shape and will operate them on an extensive scale. Ennis & Cameron have rented one of their gulches on Galice creek to Chinese, who will work it during the coming year. It is supposed to be rich. The past week has been a very favorable one for the miners. A great deal of rain has fallen, as also a considerable amount of snow on the mountains. The Sterling Co. has been doing some pipping each week for a short time past, but now has an ample supply of water and is running two pipes on full time. Brown & Co.'s mill, at the Swinden ledge, in Rock Point precinct, has not been running much of the time, owing to repairs being made and for lack of harmony among the managers. Bauble, Klippel & Co.'s mill this week finished a run on a lot of ore from McKenzie & Co.'s ledge. A cleanup was completed yesterday, but we have not learned as yet how it resulted. Several parties in this vicinity are about letting contracts to take large quantities of quartz from different ledges and thoroughly prospect the same, which is the best method possible for ascertaining the value of those lodes. If the present weather should continue much longer, the miners will be able to make an extended run, and money will consequently be more plentiful next spring than for some time past. Prof. Thos. Price, the well-known metallurgist, of San Francisco, has just returned from a visit to Portland, where he was called for a consultation with the directors of the Portland Reduction Works. These gentlemen are proceeding with reliability and precision in the inauguration of a great manufacturing enterprise. It is their purpose to "get their hand in" with an establishment of moderate size, and then expand to any capacity that the business will call for. Their stock is all taken, the machinery bought and paid for, and mostly in place, the buildings nearly completed and the land purchased and paid for. Everything is in readiness for the purchase and accumulation of ore, except the adjustment of freight rates. As soon as this matter can be settled the material and personnel will be assembled and fires started up in 10 days, provided that ore enough can be gathered before winter stops the supply to run the smelter until spring. If rates cannot be adjusted in time, the smelter will have to be idle until spring. Prof. Price regards Portland as a favorable point for the reduction of ores, and is sanguine that a great metallurgical industry has been founded here.

#### UTAH.

**REVIEW.**—*Salt Lake Tribune*, Dec. 10: The receipts of ore in this city for the week ending the 2d inst., inclusive, were of the value of \$50,421.82; of bullion for the same time, \$69,759.17, a total of \$120,180.99. For the week previous the total receipts were \$142,233.83, of which \$91,146.01 was bullion and \$51,087.82 was ore. The product of the Ontario for the week was 17,837.86 ounces of fine bullion and \$10,654.59 in ore sales, a total of \$28,492.45. The daily output for the week was six bars of fine bullion, 8339.18 fine ounces. Fine bar receipts for the week were of the value of \$12,990.15; of base bullion, \$13,400. Stormont silver bars, valued at \$2250, were sent up on the 3d. The product of the Hanauer smelter for the week was \$24,592 in bullion. Bannock bars to the value of \$5300 were received during the week. The Alice sent down, on the 3d, 17 bars of bullion, valued at \$11,237.02. The Horn Silver, of Utah, is said to be selling some ore, but the usual reticence and air of mystery attaching to the operations of this company prevail. Homestake stock, 900 shares, sold in New York during the week at \$17, \$16.75, \$17, \$16, \$16.50, \$17.25. Ore receipts in this city during the week were as follows: By Wells, Fargo & Co., \$10,700; by McCormick & Co., \$29,143, including \$4743 from the Queen of the Hills, \$1200 from the Crescent, and \$750 from the Overman; by T. R. Jones & Co., \$10,578.22.

#### List of U. S. Patents for Pacific Coast Inventors.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING DECEMBER 7, 1886.

- 353,657.—ANIMAL TRAP—John Bean, Los Gatos, Cal.  
354,037.—STREET RAILWAY CAR—J. C. Brown, S. F.  
353,785.—CAR SIGNAL—Sands Forman, Gold Hill, Nev.  
353,851.—TAPE MEASURE—J. Fountain, La Grande, Ogn.  
353,854.—FERMENTING BUNG—T. S. Glaister, Sonoma, Cal.  
353,857.—ALMOND HULLER—Jos. Hobart, Nordhoff, Cal.  
353,872.—SHUTTLE—McGee & McMahon, Oregon City, Oregon.  
353,020.—VALVE FOR HYDRAULIC ELEVATORS—P. F. Morey, Portland, Ogn.  
353,877.—HUB-BORING MACHINE—A. L. Navone, Calistoga, Cal.  
353,866.—SAWMILL SET WORKS—A. E. Roe, S. F.  
353,897.—PUMP—L. Teague, Arcata, Cal.  
354,029.—ARTERY LIGATOR—Jas. Trullinger, Silverton, Ogn.  
353,718.—LEAK-STOPPING MATTRESS—J. H. L. Tuck, S. F.  
353,727.—ORE-FEEDER—G. E. Woodbury, S. F.  
353,847.—TRADEMARK—Cal. Wire Works, S. F.  
NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

#### Mining Share Market.

The numerous failures among the brokers had the effect of depressing prices again in the market, and stocks are not so high as they were. The excitement has had the effect of bringing into notice again a lot of varieties of stock which have been out of sight for years. The list has increased largely and transactions are, of course, greater than for some time past. The excitement has somewhat abated, although the market may be still considered lively. The *Enterprise* says of the Comstock situation: There are all sorts of rumors afloat, as usual, relative to the mines, one being that the south winze of the Con. California and Virginia on the 1400 level has run into porphyry before reaching the 1500; also, that the Savage Co. has made an arrangement with the Sutro Tunnel Co. whereby the tunnel company is to extract and reduce the fine, large body of ore recently developed on the 1640 level, at the junction of the Savage shaft and Sutro tunnel. The tunnel company may have facilities enough for removal of the ore, but certainly has none for reduction at present.

The three bonanza points, the Consolidated California and Virginia, Savage and Potosi, all not only continue their good showing of high-grade ore, but improvement in their development as further explored.

#### Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Eberhardt Monitor, Dec. 7, \$2300; Richmond Con., Dec. 11, \$14,734; Hanauer, Dec. 7, \$6500; Bannock, Dec. 8, \$3600; Crescent, Dec. 8, \$3400; Hanauer, Dec. 10, \$2170; Queen of the Hills, Dec. 10, \$2500; Alice, Dec. 11, \$10,942; Hanauer, Dec. 11, \$2170; Queen of the Hills, Dec. 11, \$2880; Hanauer, Dec. 12, \$4280; Crescent, Dec. 9, \$8600; Hanauer, Dec. 9, \$6380. Last week, Wells, Fargo & Co., at Salt Lake, shipped in bullion \$37,090; McCormick & Co., \$61,275; T. R. Jones & Co., \$10,578; Union Bank, \$11,237.

THE OVERLAND MONTHLY for December has an unusually varied table of contents. The number is about twice the usual size. With an increase of reading pages, it also contains a complete history of the early days of the magazine, and its announcements for 1887. In all respects, this issue of the representative magazine of the West is a credit to the well-organized company who now own it, and is a proof of the success of the enterprise. The leading article is Prof. Hilgard's exhaustive study of The Beet Sugar Industry of California. It has both industrial and political bearings, and is one of the most important articles ever published in the magazine. Other articles are: The Poet's Pipe, James Buckham; Writings of Laura Bridgman, E. C. Sanford; Margot's Apple Sprig, Becca M. Samson; St. Anders, Charles Noble Gregory; In the Sleepy Hollow Country—Chapters V-XI—S. N. Sheridan, Jr.; Our Forests, Abbott Kinney; An Episode of Chub Guleh, L. A. B. Curtis; Women as School Directors, M. W. Shinn; The Poppy, Edmund Warren Russell; Chata and Chinita—Chapters XVIII-XX, Louise Palmer Heaven; The Works of Thomas Middleton, An Epoch-making Lie, Mary E. Grafton. Among the miscellany is the following: The Chief Need of Observatories, Mr. Lowell and Charles Francis, The Elections, the Charter and the Mayor, Winter in San Francisco, E. S. B.; Mount Shasta, as seen from Tehama, J. S. M.; San Emigdio, Mary E. Bamford; Views on Oakland Creek (Illustration), E. M. Reynolds.

#### Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Centrifugal Roller Quartz Mill.

**F. A. HUNTINGTON,**

MANUFACTURER OF

**Centrifugal Roller Quartz Mills,  
CONCENTRATORS AND ORE CRUSHERS,**

Mining Machinery of Every Description,

**Steam Engines and Shingle Machines.**

SEND FOR CIRCULAR.

No. 45 FREMONT STREET, - - SAN FRANCISCO, CAL.

ORE CRUSHER.

**NOTICE TO GOLD MINERS!  
SILVER-PLATED AMALGAMATED PLATES  
For SAVING GOLD!**

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

FULL WEIGHT OF SILVER AND BEST QUALITY OF WORK GUARANTEED.

GET OUR PRICES BEFORE ORDERING ELSEWHERE. SAMPLES  
FURNISHED ON APPLICATION.**SAN FRANCISCO NOVELTY AND PLATING WORKS,  
No. 108 FIRST STREET.**

NOTICE.—All our plates are guaranteed to have the full weight of silver agreed upon, and are tested before leaving our works, thereby avoiding the complaints about light weight, made so often before we started in this branch of industry.

CHEMICAL APPARATUS AND CHEMICALS, DRUG  
GISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco

We would call the attention of Assayers, Chemists,  
Mining Companies, Milling Companies, Prospectors, etc.,  
to our full stock of Balances, Furnaces, Muffles, Crucibles,  
Scorifiers, etc., including, also, a full stock of  
Chemicals.

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast, we feel  
confident from our experience we can well suit the demand  
for these goods, both as to quality and price. Our  
New Illustrated Catalogue, with prices, will be sent on  
application.

Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application. Agents for the Patent  
Plumbago Crucible Co., London, England. Also for E.  
G. DENNISTON'S Silver Plated Amalgam Plates. The  
plates of this well-known manufacturer are thoroughly  
reliable, and full weight of Silver guaranteed. Orders  
taken at his lowest prices.

JOHN TAYLOR & CO.

30 to 40 Spear St., - San Francisco.

ALL KINDS OF CASKS, TANKS, Etc.

SHIP, MINING, and WATER TANKS a Specialty.

**San Francisco Cordage Factory.**  
Established 1856.

Constantly on hand a full assortment of Manila Rope,  
Sisal Rope, Tarred Manila Rope, Hay Rope, Whale  
Line, etc., etc.

Extra sizes and lengths made to order on short notice

TUBBS & CO.

611 and 613 Front St., San Francisco.

**JAMES LEFFEL'S Mining Turbine Water Wheel.**

These Wheels are designed for all purposes where limited quantities of water and  
high heads are utilized, and are guaranteed to give more power with less water than  
any other wheel made. Being placed on horizontal shaft, the power is transmitted  
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in  
capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the  
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,  
by applying to the manufacturers.

JAMES LEFFEL & CO.,

Springfield, Ohio,

or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents,  
Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

**THE CONSUMERS' COMPANY.**

**VULCAN B B AND AJAX.**  
The Best LOW GRADE EXPLOSIVES in the Market.

**Vulcan Nos. 1, 2 and 3,**  
The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank  
Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

**VULCAN POWDER CO.**  
218 California Street, San Francisco, Cal.

**THE GIANT POWDER COMPANY**

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

**GIANT POWDER or DYNAMITE,**  
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and  
GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

**JUDSON POWDER IMPROVED.**

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting  
Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and  
saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manu-  
facture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under  
the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,  
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our  
IMPROVED  
HYDRAULIC  
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT  
instead of two. It is of greater capacity and more easily worked and  
kept in repair. The statement of Mr. Hendy that all styles are infringe-  
ments on the machines made by him, he knows to be utterly false. All  
litigation has been in reference to old style two jointed machines, which  
are superseded by our new style one jointed. The decision of Judge  
Sawyer, referred to by him, is carried up on appeal to U. S. Supreme  
Court, with absolute certainty of a reversal in our favor. Miners and in-  
tending purchasers are hereby notified that we are the sole owners of the  
patents covering this style of Giant; we will prosecute to the fullest ex-  
tent of the law manufacturers or users of an infringement.

Send for Circulars and Price List.

## ORE FEEDERS.

We direct attention to an advertisement, which ap-  
pears in our journal, of the "Original Roller" Ore  
Feeder, manufactured by the "Joshua Hendy Machine  
Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder,  
known as the "Templeton Roller," claim that it is su-  
perior to any other style, and cite those in operation at  
the "Bunker Hill" mill in Amador county, we expressly  
contradict the statement, and in substantiation submit a  
copy of a letter shown to us by a representative of the  
"Joshua Hendy Machine Works," which speaks for itself

BUNKER HILL GOLD MINING CO.,

AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont  
St., S. F.—GENTLEMEN: We have used the "Challenge"  
and "Roller" or "Templeton" Ore Feeders in our mill for  
the past three years, and I am free to say that I con-  
sider the "Challenge" far superior to the "Roller"  
Feeder, in that most important of all things in a quartz  
mill, namely, the regular feeding of ores to the bat-  
teries. If the "Roller" Feeder is regulated to feed finely  
pulverized ore, the coarser ore will choke the outlet of  
the Feeder, and no ore can reach the batteries. If, on  
the other hand, it is regulated to feed coarse ore, then  
the fine ore when it comes will sluice right through and  
fill the batteries. The "Roller" Feeder requires constant  
attention. Yours truly,  
(signed) N. W. CROCKER, Supt.

CALIFORNIA  
HAND ROCK DRILL,

—FOR—

TUNNELING, DRIFTING,  
and SINKING.

Buy the best and latest improved  
Hand Rock Drill; can be run by hand-  
steam, compressed air, or water power.  
Machine made entirely of crucible  
steel; light, compact and durable.  
Strikes 250 blows per minute with 7-lb  
hammer. A perfect reproduction of  
hand drilling; will drill one inch per  
minute in the hardest rock, using  
one-quarter the number of drills  
required by hand labor.

**THE ROLLER ORE FEEDER**

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

**HOOD'S FOUNDRY COKE.**

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake. The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

# \$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR  
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS  
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

Room 7, No. 109 California Street,

**SAN FRANCISCO, CAL.**

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

**BEST SOFT LAKE SUPERIOR COPPER USED.**

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.**

**E. G. DENNISTON, Proprietor.**

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

## LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning  
and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

## RANKIN, BRAYTON & CO., MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

**PLANTS FOR GOLD AND SILVER MILLS,**  
embracing machinery of LATEST DESIGN and  
MOST IMPROVED construction. We offer our cus-  
tomers the BEST RESULTS OF 35 YEARS' EX-  
PERIENCE in this SPECIAL LINE of work, and  
are PREPARED to furnish from SAN FRAN-  
CISCO or CHICAGO, the MOST APPROVED  
character of MINING AND REDUCTION MA-  
CHINERY, adapted to all grades of ores and SU-  
PERIOR to that of any other make, at the LOWEST  
POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DE-  
LIVER in COMPLETE RUNNING ORDER,  
in any locality, MILLS, CONCENTRATION  
WORKS, WATER JACKET SMELTING  
FURNACES, HOISTING WORKS, PUMP-  
ING MACHINERY, ETC., ETC., of any DE-  
SIRE CAPACITY.

## WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD  
ores of NEW and ORIGINAL DESIGNS, covered  
by LETTERS PATENT. No other Furnace CAN  
COMPARE with these for DURABILITY, and in  
CAPACITY for uninterrupted work. MORE  
THAN 150 of them are now RUNNING in various  
parts of THIS COUNTRY, as well as many in  
FOREIGN COUNTRIES, giving results NEVER  
BEFORE ATTAINED as regards CONTINU-  
OUS running, ECONOMY of fuel, AMOUNT and  
QUALITY of BULLION produced. These  
CLAIMS have been PROVEN BY RESULTS in  
ANY NUMBER of INSTANCES, and the  
GREAT SUPERIORITY of this SYSTEM of  
smelting ores DEMONSTRATED BEYOND  
QUESTION. COMPLETE PLANTS furnished  
to order of any CAPACITY, with ALL IM-  
PROVEMENTS that experience has DEMON-  
STRATED as VALUABLE in this class of work.

Beyond question the cheapest and  
most effective machine of the kind  
now in use adapted to all grades and  
classes of ores.

This machine has been THOROUGHLY TESTED  
for the past TWO YEARS, under a GREAT VA-  
RIETY of CONDITIONS, giving most EXTRA-  
ORDINARY results FAR IN ADVANCE of  
anything EVER BEFORE REALIZED. A re-  
cent COMPETITIVE TEST at the Carlisle Mine in  
Mexico, showed an ADVANTAGE OF OVER 30  
PER CENT in favor of THE DUNCAN. The  
amount SAVED OVER THE TRUE being suffi-  
cient to PAY THE ENTIRE COST of the ma-  
chines EVERY MONTH OF THE YEAR. One  
of its MOST VALUABLE features is as an AMAL-  
GAMATOR. It saves all THE AMALGAM GOLD  
and SILVER that ESCAPES the BATTERIES,  
PANS or SETTLERS, making the machine worth  
MORE than ITS COST for THIS PURPOSE  
ALONE.

## BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a  
FIRST-CLASS HOIST, and affording means for the  
CONTINUOUS OPERATION of a BLOWER,  
WITHOUT interfering with the HOISTING AP-  
PARATUS. It is made ENTIRELY OF IRON,  
no piece WEIGHS OVER 300 POUNDS. At the  
ORDINARY SPEED of a horse, a 700-pound  
BUCKET OF ORE may be raised 75 feet per  
minute. The HOISTING-DRUM is under the  
COMPLETE CONTROL of the man of the shaft,  
and is CAPABLE of CARRYING 500 feet of five-  
eighths steel rope. SEND FOR CIRCULAR.

## Formation in Copper Mines.

We give on this page engravings of a different class of copper veins from those described in the PRESS last week, as occurring in Clifton District, Arizona. The ores of both the second and third class being found in a siliceous country rock (whereas the ores of the Longfellow and similar mines are in the limestone), the gangue is more siliceous, and there is more or less sulphur in the minerals. The most prominent development of this class of ores is on the Metcalf hill, something over two miles northerly from the Longfellow mines and near the center of the Clifton copper-basin. Fig. 1 illustrates the character of deposition of these ores.

At the surface the veins form a *stockwork* in the porphyry. In depth, all the small branches of ore, covering in places a territory 100 feet in width on the surface, unite and form a single vein, which has been developed by the lower adit, shown in Fig. 1. A great deal of development-work has been done in depth on these and the other mines formed in porphyry, and the result has (continues Mr. Wendt) invariably proved that these veins rapidly deteriorate in depth and become valueless under the commercial conditions ruling at present in the Southwest. The croppings of the Metcalf mine are worked as an open cut. Several hundred tons of ore from the thin strings and small veins are loosened at one blast and then sorted. The Queen group also belongs to this class of mines.

The Coronado mines are also of this class. They are several miles west of the Metcalf and Longfellow claims, and are found in a huge dyke of quartz-porphyry cutting through syenite and granite. The latter abuts against it and is surrounded by stratified limestone. There are six claims located on this dyke, the Boulder, Horseshoe, Coronado, Crown Leaf, Copper Crown, and Matilda. When first examined by Mr. Wendt in 1881, these mines formed to all appearance an inviting prospecting field. Their large development in late years has not, however, borne out the expectations then expressed by Mr. Wendt. It is a well-known fact, alluded to in a former report on this mine by the writer, that contrary to the notion held by the vast majority of the public, metallic mines grow poorer in depth in nine cases out of ten. The decomposed surface-ores are the richest. The undecomposed base ores underlying the surface ores are both poorer and more difficult to mine and beneficiate. This has been the history of all the copper-pyrites mines in the Alleghanies. It has been the history in the Lake Superior region, where rich black oxides and accumulations of native copper are of frequent occurrence when opening the mines. It has been the history in the well-known mines of Spain, now so important by reason of their enormous production of copper from low-grade pyrites; and the same may be confidently predicted in every instance. The Coronado mines, unfortunately for the owners, have presented an extreme case of rapid depreciation of ores in depth.

The vein itself is from 5 to 15 feet wide and can be traced continuously along and throughout the quartz-porphyry dyke. It is a fissure vein parallel with and in quartz-porphyry dyke. Fig. 2 shows a cross-section of it. In places the walls are very smooth and striated. Usually they are decomposed and kaolinized for some distance into the quartz-porphyry. Where not

so decomposed, the vein is of inferior quality. Indeed, it can be laid down as a law, both for this mine and for all others through the South-

The copper glance in the Coronado mines usually occurs massive. In the Horseshoe claim, where the vein is some 15 feet wide, it

Fig. 1.—SECTION OF METCALF HILL, SHOWING COPPER MINES.

Fig. 2.—VERTICAL CROSS-SECTION OF CORONADO VEIN.

west, that indications of an extensive decomposition of the country rock are favorable to the finding of large ore bodies. From the very na-

occurs in minute particles scattered through the gangue, which is practically a matrix of kaolin with imbedded rounded particles of quartz, un-

A PENDULUM HOISTING APPARATUS.

ture of things this must be expected, for this decomposition is an accessory to the deposition of the ore, and where there has been an extensive deposition of ore, there an extensive decomposition of the surrounding rocks must be expected.

doubtedly in its original form a quartz-porphyry. On the Horseshoe claim a parallel vein has been cut and prospected to some extent. It is a counterpart of the main vein, but somewhat smaller. Wherever the copper glance in the Coronado mines has been followed down, it dis-

appears at a depth of 150 or 200 feet from the surface, and either the vein becomes barren or the glance is replaced by yellow sulphurets, sparingly disseminated through the gangue. Experimental concentrations of these yellow sulphurets gave assays of eight per cent. With the conditions governing the mining industry of the Southwest at the present time, such ore is valueless, although in the future, undoubtedly, these ores may be worked on an extended scale.

## A Pendulum Hoist.

A hoisting apparatus intended to meet the requirements of prospecting claims has been patented by John Sattes, of Butte, Montana, and an engraving of the device is shown on this page. Mounted upon the main frame is a shaft carrying a loosely mounted drum, a balance wheel, and a fixed collar, each vertical face of which is formed with ratchet teeth. Upon each side of the collar there is arranged a disk formed with a segmental rack and a downwardly extending arm to which a pendulum is attached. Meshing with each of the segment is a beveled pinion, mounted in a sleeve carried by a bracket fixed to the stationary frame. The disks are provided with pawls that are forced outward against the ratchet teeth of the collar by springs, the number of pawls being one less than the number of teeth. The motion of the shaft is imparted to the drum by a properly arranged clutch, which may be thrown into or out of gear by a lever. Attached to the drum is a brake, by means of which its motion may be regulated.

To operate the hoist, one of the pendulums is started, the force applied to it being gradually increased until it swings in the arc required. Any force exerted upon one pendulum will be transmitted to the other, owing to the connection established between them by their segments and the interposed pinion. As the pendulums swing, their pawls engage with the ratchet teeth of the collar—the pawls, of course, failing to engage during the return stroke—and impart a constant rotary motion to the shaft, and, when necessary, to the drum. If desired, the balance wheel may be left off.

**FREE COINAGE OF SILVER.**—A bill has been introduced in Congress which provides that holders of silver bullion may have the same coined into standard dollars of 412½ grains on the same terms as applied to the coinage of gold. That the silver dollar shall be the unit of account and standard of value in like manner as is now provided for the gold dollar, and shall be a full legal tender. It also provides that the Secretary of the Treasury, instead of the coinage of all the silver bullion presented, shall exchange therefor silver dollars or certificates, coining only as much of the bullion as the needs of the country may require.

**THE Bald Mountain Extension Drift Mining Company, Forest City, Sierra county, cleaned up last Sunday, for the previous six days' work, 96½ ounces of gold. The company is out of debt, has all winter and spring supplies laid in and paid for; and, with an extensive and rich gravel lead ahead of them, the prospect is very favorable for large and regular monthly dividends. Their main tunnel is 8212 feet long.**

**THERE has been a strong demand for silver from France of late.**

## CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eus.

## A Place for the Gold Where They Fine it.

EDITORS PRESS:—Your editorial suggestions in the PRESS recently, for prospectors and miners, were excellent, but I am not disposed to let the misquotation of scripture pass unnoticed. You say that a Biblical writer remarks, "gold is where you find it." Some years ago Mr. Almarin B. Paul made the same misquotation in the pages of the PRESS, but I let that pass, thinking others might point out the error. If the public libraries of San Francisco have not got a Bible or two that literary men of prominence might consult when desirous of quoting scripture, I fear the allegation of Rev. Dr. Sprecher, that it is the wickedest city in the United States, is not very far from the truth.

In Job, chapter 28 and 1st verse, appear these words: "Surely there is a vein for the silver, and a place for gold where they fine it." The word used is "fine," not find. Moses, the reputed author of the Book of Job, is evidently describing the contrast between lode and placer mining. In effect he says: "Silver occurs in veins, but gold is found in places, or placers, and is washed and made fine-gold fit for the market." It is not fair to the worthy old Hebrew law-giver to make him boom silver mining at the expense of gold mining. If people can once be brought to believe that the Bible asserts gold is only to be got by blind chance-digging, and not by skillful mining, the effect will necessarily be injurious to gold mines. If Moses knew anything of gold lodes, he was not alluding to them on that occasion, and I protest against his being improperly used to "bear" lode mining for gold.

A PROSPECTOR.

Arizona, Dec. 11, 1886.

## Lower Springs, Shasta Co.

EDITORS PRESS:—Since I wrote you last there has been quite an important excitement about the mines here. N. E. Muchmore has sold his mine and others are developing their properties. The mill that is being erected at the Gem mine is fast nearing completion. All of the machinery will soon be on the ground. The mill is placed north of the tunnel about 200 feet, just over the hill from the mine, and facing Middle Creek road, about half a mile above the bridge on Middle creek—a most beautiful place for a quartz mill.

The Bulkhead mine, south and east of the Gem mine, has a ledge which will average about two and a half feet wide so far, and the rock prospects elegantly for a new strike. The company has spent many long months running the tunnel to tap this ledge. They started in on the footwall side of the ledge and were greatly disappointed in finding hard foot-wall rock. They stuck to it like men, however, and it is hoped and thought that they have a good mine, as all present appearances indicate it.

The Eureka mine, known as the west extension of the Gem mine, is having a tunnel run upon the ledge, following it as work progresses, so as to prospect the ledge the entire distance of tunnel. Some very fine prospects are being found. This mining camp is destined to be of considerable importance to this northern part of California. All we want is more active men with money, like those interested in the Gem Company.

J. C. F.

Lower Springs, Shasta Co., Dec. 9, 1886.

A DEVICE FOR WRITING IN THE ABSENCE OF THE HAND.—A patented invention, called the brachionigraph, is claimed to render the art of writing possible in the absence or uselessness of the hand. It is therefore serviceable in cases of writers' cramp and paralysis of the fingers. The instrument is of simple construction, and consists of a long, light strip of iron, curved so as to be easily adapted to the ulnar border of the forearm. This splint is sewed into a casing of supple leather material, shaped so as to form a kind of gauntlet or sleeve for the forearm. The gauntlet is fastened to the forearm by an ingenious arrangement of screw hooks and studs, allowing of an adjustable degree of pressure. The bar or splint carries at its lower end a mechanism with a universal joint by means of which a pen may be held in any desired position. With this instrument the act of writing is performed by the muscles of the arm and shoulder, while those of the digits and thumb are thrown completely out of use. It is easy to acquire the necessary dexterity in the use of the invention for legible "handwriting."

A GOOD MINE.—The product of the Ontario mine for the month of November was 133 bars of bullion, \$1,917.68 fine ounces; ore sales, nine lots, \$73,917.11, a total for the month of \$155,913.79. This, added to the product of the previous 10 months of this year, gives a total for 11 months of \$1,540,171.16. A regular dividend of 50 cents a share per month has been paid; and yet Ontario stock sells at \$23 to \$24!—Salt Lake Tribune.

## The Golden Age in California.

## A Pioneer's Reminiscences.

At a recent meeting of the Pioneers of Alameda, Major E. A. Sherman read an address entitled "My Trip to California in 1849," from which we make the following extracts:

On the morning of the 24th day of May, 1849, Queen Victoria's birthday, with all the shipping gayly trimmed with flags, we dropped our anchor in the harbor, San Francisco.

It did not take long to get our baggage ready to go ashore, and but a few minutes elapsed ere the vessel was surrounded by boats, and we gladly paid the one dollar each to the boatmen, and in 15 minutes more were safely landed at the foot of California street, where the Bank of California now stands. Our original company having disbanded on board ship, each group of four or five members, into which smaller companies had been formed, pitched their tents in Happy valley, which lay between high sandhills, and we located about where Sansome and Market street join. Here we were encamped for nearly a week getting our supplies and outfits for the mines, to which nearly every new-comer was bound. On May 31st we took passage in a large open boat for the Embarcadero of Sutter's Fort, now Sacramento city, paying \$16 each for the privilege of rowing the entire distance of 120 miles, lying by at night and furnishing our own provisions. Stimulated by the desire to get at the mines before the gold should all be taken out, and being constantly spurred forward by countless swarms of myriads of prospecting mosquitoes, it became a question of "gold or blood" with us, and we pulled through from San Francisco in three days and a half, passing shipping of all kinds that were making their way up the river.

## Sacramento River.

On our arrival there, finding that it would be several days before a team could be had to haul our supplies to the mines, we took an unfinished contract to remove an immense lot of Chile flour in 100 and 200 pound sacks, piled up on the bank of the river at Sacramento, receiving \$10 a day apiece, which gave each of us about \$75 more than we started with from San Francisco. We took a contract to build a small bridge over the mouth of the slough at that place, and while doing so a stranger committed suicide by shooting himself in the head with an old single-barreled cavalry pistol. We buried him on the bank, where the City Water Works stand, and we were informed at the time that he was the first person ever buried in Sacramento city.

On the 12th of June we embarked in a boat for the mouth of the Feather river, and landed on the east side, where a Mr. Lawton had laid out the site for a new town called "Vernon," and immediately opposite a Mr. Jonas Specht had laid out the site of a town called "Freemont." Both town sites, I believe, are there yet.

## In the Mines.

We engaged an ox-team from Mr. Specht to take us to Rose's Bar, on the Yuba river, and on the 17th of June, 1849, the seventy-third anniversary of the battle of Bunker Hill, we were celebrating that event by our ox-team running away down the steep hill to Rose's Bar, and dumping our blankets, tools, and supplies in one promiscuous heap, with the wagon overturned and on top. Here we pitched our tent, sent back the team, commenced prospecting like hundreds of others, crossed the river in a canoe, staked out our claims and commenced mining in earnest. The pick, shovel, pan, rocker, bucket, etc., were immediately manufactured or procured, and as soon as we got the hang of the thing of rocking and panning out the gold, our labors began to be successfully rewarded, and when we only averaged an ounce of gold (or \$16) a day per man we considered it very poor diggings.

## The First White Woman.

Scarcely had we gotten down to our work when the first Fourth of July spent by us in California had to be celebrated, which was done by nearly all the men on the Yuba river paying a visit to the first white woman we ever saw in the mines. She was an Oregon woman, in a Bloomer costume made entirely out of buckskin, and who had accompanied her husband from Oregon in an ox-team. The first comers had the best show. She baked biscuits for us in a Dutch oven, and for each biscuit she baked she received a sack of flour, some of which had been packed on men's shoulders for several miles. Many gave her rich specimens, and it was a profitable Fourth of July for herself and husband.

Immediately after this miners and adventurers poured in from all quarters, and the first of the overland immigration began to make its appearance. Trouble commenced between the new-comers and the old about mining claims, and a disposition was manifested to overturn the district mining laws by reducing the area of each claim, which would have amounted to a confiscation of about one-half of each claim that was located, which would have been resisted with arms and ended in bloodshed; which, singularly enough, was fortunately averted by an event which turned the tide in another direction; the interest involved affecting not California alone but the nation itself.

## The Slavery Question.

There came at that time at Rose's Bar, on the Yuba river, a few Texans under the leadership

of General Green, who, during the war for the independence of Texas, was taken prisoner with others by the Mexican troops, confined in prison in Mier, where he was fortunate in being one of those who drew white beans, while one-tenth of the number who drew black beans were shot. The others were taken to the interior of Mexico, confined in dungeons, and made to work upon the public roads, quite a number of whom, with himself, made their escape, about which he subsequently published a book. General Green, with the other Texans, brought some of their slaves along with them, who were to work three years for their masters, at the end of which time they were to have their freedom. In the location of claims along the river, General Green also staked off claims in addition for his negroes, the ownership of which should be in himself. When this matter became noised about the miners protested strongly against it, and he was told that he would have trouble. He declared that he would do as he pleased and take up as many claims and work as many niggers as he saw fit, and if interfered with he would fight.

## No Slaves Allowed in the Mines.

At that time there were three claims located together by one company, called "The Governor's Claim," from the singular fact that they were owned by the three ex-Governors there from three different States, among whom was ex-Governor Shannon, of Ohio.

A meeting was called of all the miners on the river, and ex-Governor Shannon presided. A statement of the facts was presented and a resolution was unanimously adopted "that no slave-owners should bring slaves in the mines and take up claims in their names, nor should slaves be allowed to work for any man in the mines." A committee was appointed to wait upon General Green and inform him of the action of the meeting. Of that committee I was one, knowing General Green personally, having met him during the Mexican war. Governor Shannon went with us. We stated the result of the action of the meeting, which the entire body of miners would enforce, and advised him to either send his slaves back to Texas or set them free. He was very angry and talked of resistance. We told him that he was very foolish to express himself in that manner; that he could not hold his slaves a single hour if the miners told them to go, which they certainly would; that it was an unwise thing for him to bring them away from home, and he would have to take the consequences; that the people would allow no slavery or forced manual labor in the mines.

The next day he sold his own claims and left. Whatever became of his slaves we never learned, but when the orders came from General Riley, Military Governor of California, to hold an election for delegates to the Constitutional Convention to meet at Monterey, we elected Governor Shannon as one of the delegates, with instructions that the Constitution should provide that slavery should be forever prohibited in the State of California.

The action taken at Rose's Bar on the Yuba river was the first step taken in that direction; and as the news spread from one mining camp to another the public sentiment became so unanimous upon the subject that when the convention met that provision was adopted without debate.

## The Early Pioneers.

The best years of our lives have been given to the development of the Golden State of California. Those who came at the time do not exceed 10 per cent of the original number. Seventy per cent are mining upon the golden shores of the beyond, and the rest are living in the other States and Territories.

There are only four now living in California of my original company: Judge Robert Thompson, Samuel Heyneman and Rev. Charles M. Blake, ex-Chaplain of the United States Army, residing in San Francisco, and myself. None of the original company were ever tried or convicted of any crime or hanged, though some of us have helped to hang others who were guilty of foul murders, and the people rose to inflict condign punishment.

Of those who joined us at Mazatlan and came on the bark *Fannie* to San Francisco, not over a dozen are now living, so far as we are able to learn. Col. A. W. Von Schmidt and brother, in San Francisco; Dr. McMurtry, of Los Gatos, in Santa Clara county; Israel Luce, in Sacramento, and our Brother Pioneer Newton Sewell, the honored Treasurer of our society, are all that are known.

From these personal reminiscences of our early experiences the true history of the founding of the State of California should be made up. All that has subsequently occurred is interwoven with the life and progress of California, in which each, both men and women, have indelibly written their own; and not until so late a day as the organization of this society has woman, who suffered the greatest hardships, endured the greatest privations, and helped to rear a State, received the full share of honor and meed of praise in being admitted to full fellowship, which, if longer denied, we would have been unworthy the name of California Pioneers or American citizens and gentlemen.

DUN GLEN MINES.—Assemblyman Ward reports the Dun Glen mines as looking well, and the Ross and Thomas & Hendra mills running steadily. The mills are run on gold-bearing rock exclusively, though some very rich silver leads have been found in the district.—Silver State.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FERMENTING BUNG.—Thos. S. Glaister, Sonoma. No. 353,854. Dated Dec. 7, 1886. This is a bung for casks or vessels which are provided with a valve for the escape of gas under pressure; and the invention consists in the peculiar construction of the valve and its application to the bung. The object is to provide a simple and serviceable bung of the class which is effective in its operation, and not liable to get out of order.

HUB AND GENERAL BORING AND MORTISING MACHINE.—Antonio L. Navone, Calistoga, Napa Co. No. 353,887. Dated Dec. 7, 1886. This is one of that class of machines adapted for hub-boring, general boring of various kinds and mortising; it consists in new and useful mechanisms for fitting the machine on the hub and clamping it; for boring various-sized holes, with any desired taper, for rotating, feeding and reciprocating the cutter, bit, or blade-carrying spindle; for holding the work in proper position, and for serving other necessary purposes.

PUMP.—Logan Teague, Arcata, Humboldt Co., Cal. No. 353,897. Dated Dec. 7, 1886. This is a pump in which the discharge is occasioned by the displacement of the water caused by the introduction of the plunger within a confined body of water, and the suction is occasioned by the withdrawal of said plunger. The invention consists in a cylinder provided with peculiarly arranged entrance and outlet valves, a reciprocating plunger of smaller diameter than the cylinder, and adapted to be inserted and withdrawn from that chamber of the cylinder formed between the valves, and in an arrangement to provide escape for the water when the plunger is at rest, whereby the danger of bursting from freezing is prevented.

SAWMILL SET WORKS.—A. E. Roe, assignor to Tatum & Bowen, S. F. No. 353,886. Dated Dec. 7, 1886. In the mechanism for operating the feed-screws of the head-blocks in sawmills, considerable difficulty has been experienced in making the movements exactly the same when the lever is moved upward and downward, so that a certain number of movements of the lever will produce a corresponding movement of the screws, whether the movement be upward or downward. This invention consists of a mechanism by which this obstacle is overcome, and by which the ratchet-wheels attached to the screws of the head-blocks may be rotated an equal amount by the upward and downward movement of the operating lever. It consists also in a means for regulating the amount of cut in inches and fractional parts.

LOOM-SHUTTLE.—P. F. McGee and M. McMahon, Oregon City, Oregon, assignor of one-third to Albert Stokes, same place, No. 353,872. Dated Dec. 7, 1886. This loom-shuttle consists of a pivoted lever for engaging the base of the spindle-butt and locking the spindle, a small spindle having a head engaging and holding the rear of the spindle-butt against the wood of the shuttle, a spring actuating both the small spindle and the locking lever, and a lock spring on the base of the lever for the bobbin. The object is to bring a pressure upon the spindle-butt so directed as to hold it from behind against the wood of the shuttle, and thereby prevent the spindle from being tipped or pressed below the center plane of the shuttle, whether it is locked or unlocked, and at the same time to lock and hold the spindle steady on said plane, and adapted when locked to resist any blow or concussion which would have a tendency to press it either up or down.

ALMOND-HULLER.—James Hobart, Nordhoff, Ventura county, Cal. No. 353,857. Dated Dec. 7, 1886. Almonds have usually been hulled by hand, and with a large crop this is a tedious and laborious operation; but with a machine, such as Mr. Hobart has invented, the work of hulling is performed quickly and at much less expense than by any other method. The almonds are fed to a bed or frame, which has an uneven surface on its bottom, over which said almonds pass. A rubber is then reciprocated over the almonds, whereby their hulls are broken and separated from the nuts. The hulls thus separated and broken fall down through the open bottom of the bed or frame, and the nuts pass down an incline, where they are collected. In this operation of course some of the nuts will be broken; but these will fall through with the hulls and can be separated by a subsequent screening operation. The huller can be run by hand or power mechanism.

CAR SIGNAL.—Sands Forman, Gold Hill, Nev. No. 353,785. Dated Dec. 7, 1886. This is of that class of signals in which a whistle located upon or near the locomotive of a railway train, and connected with an air receiver, is operated by means of valves within an air pipe passing through the cars of the train and connected with the whistle and air receiver. Mr. Forman already has one patent on this class of signals. The new invention consists, in connection with a single pipe passing through the cars of the train, and having

suitable valves for effecting and controlling the escape of air from said pipe, of a novel valve, controlling the whistle, and a connection between said valve and the pipe and the air receiver, said connection being controlled by a cock or valve. The object is to simplify the signal by constructing it in such a manner that but a single pipe passing through the cars of the train is necessary.

### The Blue-Bird Mill, Montana.

The works cover something over an acre of ground and were built at a cost of about \$300,000. They are situated half a mile below the mine, on a steep declivity or bluff, on the right bank of Silver Bow creek. The ore is conducted from the mine to the mill on a tramway by force of gravitation, no motive power being employed except to return the empty cars.

The mill is a dry crusher—that is, the ore is reduced to a fine pulp in a dry state, no water being used in the batteries. Sixty stamps are dropping on ore and 10 on salt, making 70 stamps in all. Twenty-six pans and 13 settlers are employed. A 400-horse power Corlies compound engine moves the vast machinery with the precision and steadiness of clock-work, scarcely a jar being perceptible in any portion of the immense building except in the immediate vicinity of the batteries. In the construction of the plant advantage was taken of the latest improvement in mining machinery and its working, hence the Blue-bird mill is not only the largest dry-crusher in the world, but stands as a model of completeness in details and of economy of working. The present capacity of the mill is 90 tons per day, which will be increased to 100 as soon as the roughness is taken off of the shoes, dies and batteries.

A machine shop, blacksmith shop and carpenter shop occupy a roomy building apart from the plant, where fine work under skillful hands is being daily turned out. In an apartment of this building electricity is generated for the lighting up of the entire works at night. The retort-house is a few rods distant, where the furnaces are in course of construction. The company will commence shipping bullion in about 10 days.

Wood, coal, salt and other mill supplies are brought to the doors of the great works by a track from the main line of the Montana Union Railway, 200 or 300 yards distant. All the buildings are thoroughly painted on the outside, and the woodwork inside bears evidence of the same care. Everything in and about the works shows order and strength in arrangement and masterly workmanship in construction. The whole reflects great credit upon Mr. Grant, the building superintendent.—*Butte Miner*.

### Nevada Mines.

The *Silver State* is indebted to the Superintendent of the Carson Mint for a copy of the report of the Director of the Mint on the production of precious metals in the United States for the calendar year 1885. Three estimates of the production of the precious metals in Nevada are given for 1885. The first is that of Wells, Fargo & Co., estimated by J. J. Valentine, and is as follows:

Gold dust and bullion, by express .....	\$1,253,355
Silver bullion, by express .....	6,575,430
Ores and base bullion, by freight .....	1,384,368

Total .....

The second is the production, as reported to the State Controller by county assessors, which is given by counties, and aggregates \$6,636,781.16. In this report Humboldt county is credited with \$253,512.12 in gold and silver.

The third estimate is by William Garrard, Superintendent of the Mint at Carson. This is also given by counties, the aggregates being as follows:

Gold .....	\$3,083,800
Silver .....	6,229,311

Total .....

Mr. Garrard states that his estimates are based upon the above reports, upon the answers of many mining superintendents, and the best available information from all sources. He credits Humboldt with having produced \$80,000 in gold and \$250,000 in silver, making a total of \$330,000.

**PATENTS TO MINING GROUND.**—The owners of mining ground of any kind should get patents for their claims or ground. Possession may give a good title as long as that possession is maintained by a strict compliance with customs which have the strength of law. But possession is good only against parties other than the United States. The policy of the United States can change in regard to mining grounds which are not conveyed to owners by the United States. When the Government, however, gives a man a patent to a piece of ground, the ground is that man's. No change of policy will affect his ownership. The patent gives the best title, and that is what every owner of land, mining or other, ought to have. And then it really costs less to get the perfect title which a patent gives than it costs to keep up a possession which may give a good title, but certainly does not give the best. Congress may pass a law which will do away with mere possessory titles; Congress cannot enact a law which can do away with patented titles.—*Foot-hill Tidings*.

### River-Bed Dredging.

The *Virginia Chronicle* has the following to say concerning the small steam dredge which Dr. Rae constructed to prospect the Carson river-bed, in successful operation near Dayton. The doctor says the experiments with it demonstrate that the value of the deposit of quicksilver and amalgam mingled with the sands lying above the bedrock of the stream is far beyond all estimates heretofore published.

The deposit varies in depth from 4 to 90 feet. Careful assays of the material in bulk ranged from \$3 to \$75 per ton. Of this, 50 per cent is quicksilver and amalgam, and 25 per cent sulphurets.

The deposit lies in stratas. The composition in some of these layers is of an adhesive nature in the form of slimes, which, when sucked up by the vacuum chamber, choke the pipe. The doctor will leave for San Francisco in a few days to personally superintend the construction of another small steam dredge, in which this fault, as well as numerous other defects in the dredge now in use, will be remedied.

The scows to receive the machinery of the practical working dredges, as heretofore stated, will be 100 feet long and built in sections, each 20 feet in length, bolted together on the same principle as canal-boats plying on the New York and Erie canal. The object in constructing the scows in sections is for the purpose of facilitating the moving of such long craft around the numerous sharp bends in the Carson river. When a point is reached where an abrupt curve interferes with navigating the scow through the channel, the sections can be disconnected and propelled around the bends separately.

The object in having the scows of such great length is for the purpose of accommodating the triple strings of sluices, which will have a total length of 300 feet, and will be arranged in tiers one above the other, as heretofore described.

With the dredges of the dimensions of the operating size above described, the doctor estimates that it will require a decade to recover the wealth buried in the Carson. Dr. Rae announces that he intends to make this dredging project the final crowning effort of a life successfully devoted to scientific investigation in the broad field of mining engineering. With this end in view he is moving cautiously, and carefully considers every step, confident that the final result will vindicate his ability to resurrect the fabulous wealth now buried in the shifting sands of the river bottom.

He has demonstrated that he can raise with his dredge the deposit on the bedrock of the stream, and is equally sanguine that with his system of sluices he can secure a large percentage of the wealth it contains. The doctor's knowledge of river-bed mining was acquired through long years of practical experience. He is perfectly familiar with all its details and can "run down" a pan of dirt as closely, skillfully and speedily as the most experienced placer miner on the coast, as well as plan and direct the construction of the most complicated and ponderous machinery required to accomplish his ends.

Prominent mining men, who, before witnessing the prospecting dredge in operation, were skeptical in relation to the success of the project, are now convinced that it is perfectly practical and that the dredging process is the only method whereby the wealth of the river bed can be resurrected, and that Dr. Rae is the right man in the right place.

**A QUARTER OF A MILLION.**—The Maryland quartz mine is situated due south of the Idaho quartz mine, which latter has already produced about \$10,000,000 in gold, and the Idaho ledge rims on its southeast side through the Maryland ground. The Maryland claim is not a railroad section, and is owned by the Maryland Mining Company—a corporation among whose stockholders are S. P. Dorsey and the Coleman Brothers, of Grass Valley. Some time since the C. P. R. R. Company undertook to prove off the mineral from certain lands in that vicinity, among which were certain portions of Section 25. Somehow the lot, on which the Maryland stands, became afterward "listed" to the Railroad Company by the Sacramento Land Office, which entitled the company to a patent therefor as agricultural land. Subsequently the land was quit-claimed by the Railroad Company to certain persons having no interest in the Maryland mine, but as the patent has not issued, the Maryland Company are said to have taken steps to preserve their rights and show the nature of the land. The Maryland people have spent about \$30,000 on their mine, but hold no patent to it. As the only extension of the Idaho ledge ever discovered, the Maryland mine is reputed to be worth a cool quarter of a million.—*Nevada Transcript*.

**HARDENING GUN BARRELS.**—English newspapers report that a Mr. Neupert proposes to improve by condensation and hardening the barrels of small arms, tubes and the like, of iron, steel or other metals, in their finished state, by subjecting them to a pressure of 500 to 550 tons while they are immersed in water or other suitable liquid in a sufficiently strong vessel, performing the operation by hydraulic pressure caused by a heavy hammer falling on a piston which closes the said vessel in which the objects to be condensed are inclosed.

### An Alaska Forest.

Enormous Trees Ground to Pulp by an Advancing Glacier.

Frederick Schwatka writes an interesting letter to the *New York Times*, which gives one a life-like pen picture of an Alaskan forest in the presence of peculiar surroundings. It moreover furnishes some valuable information in regard to the great size of some of the forest trees in that far northern region. We extract as follows:

Wandering around near camp, I was struck with astonishment at the great size of the trees of the forest into which we had crept. Within 20 feet of our camp-fire were two trees, one of which measured 12 feet 7 inches and the other 17 feet in circumference at the height of a person's arm from the ground. The latter had its thick, shaggy bark stripped off nearly to the ground, being a dead tree, and thus losing much of its measurement. About 30 yards from camp was a tree that gave 21 feet in circumference at about six feet from the ground. The most astonishing part was that such a forest should be found actually surrounded by ice 10 to 20 miles across in every direction. Of course, it is reasonable to suppose that trees were here before the ice, and that this forest probably once connected with the forests of the great flat lands. Here was undoubted evidence that this small forest was being obliterated rapidly by the advancing front of the Guyot glacier, the foot-ice grinding the huge trees into pulp and splinters as surely as a quartz-crusher grinds the rock into powder. Trees five and six feet through were bent over and splintered as if they were brush, while some of the fallen trunks were split longitudinally into perfect kindling-wood. It was the mills of the gods grinding slowly, etc. Nor were they grinding so very slowly, either, as one could see by comparing them with other glacial action near by. But a little way off, probably a half a mile to a mile away, was a small clump of woods into which the glacier in the past had protruded, as shown by the fallen shattered trunks that lay near the edge of a small moraine, from which the glacier had now retreated a great number of rods.

Out from the bristling line of shattered tree trunks, piled over each other for nearly or fully 100 yards, all the spruce trees were dead, but still standing, their whitened trunks and long, gaunt limbs contrasting strangely and conspicuously with the trees still covered with foliage that formed their background. These dead evergreens had been actually killed by the proximity to the ice without its touching them, and either by its chilling influence, kept up throughout the year for probably centuries, or the constant application of the ice-water about their roots preventing their growth; for along this foot-ice there was always a marshy stream of ice-water draining off to the nearest muddy creek or rill. This was true of the glacier foot, not over 50 yards from our camp in the forest, for here we got our water for cooking purposes, but here, also, the ice of the glacier had evidently come forward so fast that the trees were rather killed by direct crushing of their trunks and limbs than by the slower one of the influence of the great masses of ice near by, and it was possible to sit down on this foot-ice of the Guyot glacier, probably 10 to 20 feet thick at that point, and at the same time be under the shade of a huge evergreen tree, if a person desired two such cooling influences at the same time. Thus I came to the conclusion that the front of this great glacier was like the fingers of some huge radiating animal prolonging themselves outward and retracting again at long intervals, that would require many human lives one after the other to measure a single stride and its backward flow.

**THE RENO REDUCTION WORKS.**—The near approach of the completion of the new reduction works is most gratifying. The flume was finished some time ago. The large Lefell wheel has been in position several days, and most satisfactorily does its work. Power has been attached to the rock-breaker, and the machinery for sampling. Two batteries, each with five 800-pound stamps, will soon be in shape. Five pans and two settlers are ready to be put in working order. The 40-ton Howell furnace is mounted and the masons and bricklayers will soon have completed their part. The dust chambers are in readiness. All this ponderous machinery is expected to be set in motion during the first week in January. Ore is coming from all directions by the sack and carload. Thus far the company has paid out about \$30,000 for ore that has been delivered. Nearly every available spot in the spacious storehouse for ore has been filled. In addition to this large quantity purchased, John Howell has of his own, in ore and concentrates, about 150 tons, a part of which has been shipped, and the remainder is at his mines and mills in the southern country. There is no reason why Reno should not become a second Denver. There are mines within sight, and the incoming of ore and samples indicates that nothing has been or is known, comparatively, of Nevada's mineral resources.—*Reno Gazette*.

**PLACER'S STONE INTERESTS.**—At present work is a little slack in the granite business in this county, though with the commencement of the work on the Mare Island drydock contract business in this line will take quite a boom.

Mr. Griffith, of Penryn, is in hopes also of getting the contract for the stone for a large new wine-storage building which an association is about to erect in San Francisco. The future outlook for the stone business in Placer is, to say the least, rather encouraging. The stopping of contract work at the Folsom State Prison alone will, if adhered to, do much to stimulate the granite business in the large quarries in this county. Two vacancies will occur on the 1st of January next in the Board of State Prison Directors, and our quarry-men should use their influence to have men appointed to fill these places who are known to be friendly to their interests.—*Placer Herald*.

### West Point Mines.

A correspondent of the *Calaveras Chronicle*, writing from Rich Gulch, says:

The country bordering on the Mokelumne river, extending from Mokelumne Hill to West Point, will undergo an unprecedented change in the way of the development of its mineral resources during the winter and the ensuing spring and summer. A mining boom is now under a fair headway in West Point and vicinity, and is attaining larger proportions as time progresses. The bonanzas there retain their volume and increase in richness as depth is attained, thereby attracting the attention of the outside world that that district well merits. West Point now boasts of possessing the banner mine of Calaveras county. It has two other dividend-paying mines that are running a close race in trying to outdo their more successful rival in unobscuring the precious metal, and in unfolding a greater extent of golden area. A half-dozen paying mines will be added to the list when the fleeting wings of another year will have passed around. The old quartz-mining camp now presents a lively appearance after having awakened from a long sleep, and reminds the old pioneers of the golden days of yore—the days of "grinds and cleanups." Thanks to some supreme power that it is no more a "twenty bean for a quarter camp." The boom will re-echo to Glencoe, Railroad and Rich Gulch, and from the many mines that will be opened and prospected in those localities a few will turn out paying properties, thus proving to the world that gold existing in paying quantities lies secreted within the bosom of these metalliferous mountains, and only awaits the helping hand of capital to unfold their hidden treasures.

The extravagance and mismanagement which has marked the path of many mining operations that have been carried on in this region in the past, is an undeniable proof that our mines have not had a fair test yet. And the capitalist who has partaken of the bitter pill of sad experience ought to be cautious in selecting only honest, practical and economical superintendents—those that will serve him faithfully and work for the best interests of their employer.

Mining is a business, and if not prosecuted from a business standpoint, a collapse will unavoidably follow even under the most favorable circumstances where the fissure may be profusely spangled with the glittering metal. This has been proven time and again where an experienced superintendent has held of a mining failure, and who by good practical and discreet judgment has lifted and redeemed it from all embarrassments and placed it on a paying basis. It is a great deal owing to the advent of these kind of men that mining successes are rife in the upper country.

**STATE MINING BUREAU.**—Recent contributions to the State Museum include: Globular pyrites, Alaska, from J. W. Kelly; gold quartz with petzite, Bald mountain, Tuolumne Co.; Fred Hellman; specimens of wall rocks and vein matter, Zeile mine, Amador Co., Cal.; W. F. Detert; crystallized apatite and galenite, Joplin, Jasper Co., Missouri; J. Z. Davis; specimens of ores from Washington Territory and the Coeur d'Alene district, Morris Cohen; rare minerals, Cornwall, England; silver ore from Shasta Co.; W. P. Litten; ores from Santa Fe district, Esmeralda Co., Nevada; J. R. Scupham; linarite, anglesite, and caldonite from Cerro Gordo, Inyo Co., Cal.

**A MOUNTAIN OF PAINT.**—A few months ago while some men were prospecting for gold in the western part of Calaveras county, large quantities of earth of all colors and shades were discovered. The substance rested in layers, and upon further investigation it was found that it extended over about 20 acres of the mountain on the side of which it was found. The substance was found to be various varieties of ochres. The find was a veritable mountain of paint containing all the primary colors with their various shades. Sanford & Wooley, of Campo Seco, are now putting up all necessary appliances for getting out the paint for market. Judges think the find is an important one.—*Stockton Mail*.

**A NEW MINING COMPANY.**—George Lovelock, who is largely interested in the nickel and cobalt mines in Cottonwood canyon, has just returned from San Francisco. He informed a *Gazette* reporter at Reno that a new company has been organized to work the mines, and the Union Iron Works at San Francisco will furnish the necessary machinery.

CHINESE iron and steel are becoming an important competitor in the world's markets,

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**ENTERPRISE.**—*Ledger*, Dec. 18: This mine, located at Enterprise, near Huse's bridge, on the Cosumnes river, is the only one in operation in that camp. It is owned by Messrs. Hayward & Hobart. Shaft has been sunk several hundred feet—600 feet, we are told—disclosing a very large ore body at that depth. Whether the rock carries gold in paying quantities is a problem that remains to be solved. It is probable that a crushing of the ore will be had at one of the Plymouth mills to test this question, and if the ore comes up to the paying standard, the erection of a mill near the mine will be proceeded with at once.

**MISCELLANEOUS.**—At the Moore mine they are running a drift north at the 500-foot level, for the purpose of striking a ledge which crops out on the surface, and appears to be of better quality than any yet discovered. The drift has been run nearly 100 feet, with over 200 feet to run to reach the point aimed at. It will take from two to three months to complete this work. At the big tunnel at Middle Bar they are working above and below the tunnel level, with no new developments to report.

**SUTTER CREEK.**—The prospects of the early starting up of the Wildman have materially improved during the past week. It is reported that the bond has been redeemed, and the property purchased outright. John Tregloan, Sen., has been East for some time, endeavoring to form a company to take hold of the property. In this mission he has succeeded. He is now on his way back, and is expected to arrive here in a few days. Several mining timbers have already been delivered on the ground, and laggin and other material is to follow. W. Strickland is making preparations to start up his gravel claim, situated about five miles above here. They have more ground opened than at any time in the history of the claim, and another good rain will enable him to commence operations.

**MORE STAMPS.**—*Amador Sentinel*, Dec. 15: Sixty more stamps are to be added to the Quartz Mountain mill. Clark Randolph has got his five-stamp mill to running at the Olive mine, Drytown. Ten additional stamps have been added to the mill of the South Spring hill at Amador city, making 30 in all. Timbers are being hauled to the Wildman mine, Sutter creek, which would indicate the intention of starting work upon that property. There is again talk of starting up the Alpine mine, of Plymouth. The result of the inspection of Prof. Thos. Price, made a couple of months ago, is said to have satisfied the English owners that they have got a good mine.

## El Dorado.

**GARDEN VALLEY.**—*Cor. El Dorado Republican*, Dec. 16: The Ivanhoe Min. Co. are pushing their hoisting works. Mr. Knox and his son, Charlie, of Oakland, the owner, are superintending the erection of the works. They bought Harry Grover's engine at the sawmill on Travers creek. What El Dorado county wants is a few men of means, like Mr. Knox, of careful and unceasing energy. With such men we will have mines that will pay and the long-lost reputation of this county will be regained. Chas. Boden has charge of the mine.

**GEORGETOWN.**—A number of quartz mines in the vicinity of Garden valley are in active operation this winter, and we are confident there will be a great boom in quartz mining around here before spring. The Walker brothers are putting up machinery on the Alpine mine, southeast of town. We learn that the ore they mined turned out better than they expected. The Slate mountain mine is still running, with fine prospects in both the upper and lower levels. The Grover brothers are getting fine prospects out of the New York mine. This promises to be a good mine in the near future. N. B. Houston has commenced work on the St. John mine.

## Inyo.

**NEW MILL.**—*Inyo Independent*, Dec. 18: A force of men was put to work, this week, preparing the ground for the erection of a new mill at Soda Springs. This mill is for the Mount Diablo Co., of Candelaria. Water will be carried down to the mill from the springs, in pipes. Already there is quite a little stir at Soda.

## Mariposa.

**NEAR BENTON MILLS.**—*Cor. Mariposa Gazette*, Dec. 18: Thinking that your readers would like to hear a little mining news from the north side of the Merced river, in the vicinity of Coulterville, Bull Creek and Red Cloud, I drop you a few items, gathered from a trip of inspection in that direction. In crossing the Merced river at the Benton mills, I commenced ascending the Buckhorn mountain where I first fell in with the Repetto and Lewis quartz mine, from which several rich pockets have been extracted during the last two years, and the owners are still trying to find more. From this mine we traveled through a large scope of country until we reached the Martin Walling mine, on Gentry's gulch, belonging to P. P. Mast. This old mine has in the course of time been extensively worked and produced a great amount of gold, but owing to the high cost of fuel, lumber and timber, further work upon the mine has ceased for the present. We visited the well-known Hasloe, which is also situated on Gentry gulch, and has been extensively worked and produced considerable gold, but it is expensive working on account of water. It has to be worked by steam power, and latterly it has lost all its machinery for hoisting rock and water by a fire which mysteriously broke out and consumed several thousand dollars worth of property. The work upon this mine is probably suspended for some time. The next mine we came in contact with belonged to Mr. John Uren, said to be a good mine and worthy of the attention of capitalists, which if it could command would result in its being the "star" mine of this section. Our visit next extended to the Bandereta, a well-known mine owned by P. P. Mast, and under the management of C. L. Mast, who is, and has been, the superintendent ever since the mine was purchased by the present owner. The owner of the Bandereta has displayed remarkable tenacity in

his holding on and execution of a vast amount of labor upon this mine for the last five years. He has not realized as large a return as was anticipated. Leaving the Bandereta and traveling up the river about two miles, we came to a mill worked by the Reed boys of Coulterville, and judging from common report the owners were being well paid for their labor. We now come to the Red Cloud, which at present—as the boys would express it—"is taking the cakes" from all others on that side of the river. It is owned by a San Jose company, and is paying regularly a fair monthly dividend to its stockholders. They have about 30 men employed in and about the mine. J. S. Carter is general superintendent, a man who is well qualified and liked, and a good man for the position he holds, in the interest of the company. John Guest, of Bear Valley, is his foreman under ground. The mine is 430 feet deep, which nowadays is a very shallow mine. From each 100 feet they have a drift or level run each way, which shows a good-paying mine all through. The average of the vein is about five feet wide. They have an 18-stamp mill, which is kept running by steam day and night by Louis Repetto and Thomas Marshall, Jr., two good, reliable men.

## Nevada.

**CENTENNIAL.**—*Transcript*, Dec. 17: Henry Richards, superintendent of the Centennial, was in town yesterday. He reports work to be progressing favorably at the mine. The sinking and drifting operations were for awhile interfered with by a heavy flow of water making in from the 100 level; but a reservoir was constructed at a point 130 feet below the mouth of the shaft, and now the water coming in from above that depth is pumped directly to the surface from the reservoir. This is much cheaper and easier than letting it go to the bottom of the mine and raising it all of the way up again.

## San Bernardino.

**EDWARDS' LEACHING WORKS.**—*Calico Print*, Dec. 18: West of Wall Street canyon, about 1500 feet west of the graveyard, Dan Edwards has built leaching works for the reduction of silver ores. He has built 5 tanks each 4½ feet wide by 8 feet in length and 3 feet high, and holding 5 tons each, thus giving a running capacity of about 15 tons per day. The tanks are supplied with water by means of a pipe connected at the lower end of town with the main pipe of the Calico Water Works Co. About 1000 tons of ore have been contracted for from the Cuba mine in East Calico, and to-morrow the process of leaching the ore will be commenced.

**WILLIAM LANDMAN'S LEACHING WORKS.**—The leaching works at the foot of Main street, formerly owned by W. A. Sharp, the absconded W. F. & Co.'s agent, now belong to Wm. Landman, clerk in I. Norton's store. A few days ago the works were leased by Jas. Harper & Co., who have commenced operations. They are confident that they will be able to successfully treat ore of a very low grade. The success of the leaching process will soon be followed by an increased activity in chloriding and systematic mining.

## San Diego.

**THE JULIAN MINES.**—*Cor. San Diego Sun*, Dec. 16: The continuous and increased flow of bullion from our camp, together with the rapid developments into prominence of some prospects, are attracting the attention of mining capitalists to this district.

Since the recent rich strike in the Owens lower levels our camp has been visited by capitalists and prominent mining experts. Some sales have been made and others are in abeyance awaiting the concurrence of principals. Notable among them are the Ready Relief mine, mill and timber land, on which is given an option to English capitalists for \$100,000.

The Tarwater & Stratton mine and ranch on which it is situated is wanted by Los Angeles capitalists for \$40,000. No sale at that price.

One-third of the Owens mine has been bought by one of the late owners of the Stonewall mine. Terms reserved. One-half of the Argonaut mine has been sold to a party in San Francisco. Terms reserved. Negotiations are pending with prominent mining men for the sale of other valuable properties.

The yield of bullion from the Owens mine the past month is largely in excess of any previous month's yield. Considering the quantity of ore reduced in that period, the product is marvelous.

From the Oriflamme mine is being shipped to its owners in Boston, one-half ton of ore, that they may see it treated under their own observation by the most scientific mineralogist and by the most practical metallurgist. It is known here that certain deleterious mineral substances are present in its ore and that the milling process at the mine is nugatory in separating the gold from its combination. The Stonewall mine continues its shipment of bullion as usual. Appearance of the mine is indicative of continuous shipments.

## Shasta.

**MILL.**—*Republican Free Press*, Dec. 18: On Monday morning W. R. Conant's 10-stamp mill, Squaw creek, started up in successful operation. There are 380 tons of good ore in the shed that will average \$30 to the ton. Eighteen tons of ore are being taken out daily; four tunnels are being driven ahead and general activity prevails. A force of 37 men is employed. Mr. Chick, of Chico, is here with the view of putting up one of his patent furnaces for the working of rebellious ores. One has been erected at Yreka and gives good satisfaction. It is claimed that Mr. Chick's process is equal to the Denver Works. If this is so, mine-owners can save a great deal of money, as thousands of tons of ore go to Denver annually from Shasta county. Mr. Chick proposes to build his works in Redding. The Riley & Matthews mine on Squaw creek is now owned by Mr. Riley. This mine was located by Jack Conant, and we understand that Jack received a payment of \$5000 on it last Thursday. Mr. Riley, since purchasing the mine, has thoroughly prospected it with two Huntington mills, and proposes to erect an old-fashioned 15-stamp mill; in fact, is making arrangements for the necessary pipe for water power. He has some very rich ore in sight, and being an excellent judge of a mine, the erection of a 15-stamp mill is a good indication of permanency.

**GOOD PROSPECT.**—*Shasta Co. Democrat*, Dec. 16: John Tiffin has at last struck a prospect at Lower Springs that has every earmark indicating a veritable bonanza. It joins the Muchmore mine lately

purchased by W. P. Miller, for a San Francisco company, which has yielded extraordinary rich ore so far as developed. John has succeeded in tapping his vein with a short tunnel, and thinks he can safely estimate that he has \$40,000 in sight. There is no more deserving miner in the county than John Tiffin, for he has done many months of hard work prospecting and mining with hard luck always against him. The gulches all around Lower Springs in the palmy days of placer mining in this county, yielded up immense pay in quartz gold.

**RICH QUARTZ.**—Tutlock, a prospector who discovered a rich quartz vein near Minersville about two months ago, has taken already over \$8000 with a rocker and hand mortar. Frequently chunks of gold quartz worth from \$100 upward are found in decomposed ledge matter.

## Siakiyou.

**SCOTT RIVER.**—*Yreka Union*, Dec. 16: The quartz mill which had suspended operations for a short time past, will resume operations Monday. Magoffey Bros. are doing well in their drifting claim on Graveyard hill, also A. Neilson, working on same hill. Several claims of minor importance are springing up, as water is getting more plentiful. Henry Preckel has resumed operations on Hooper hill. It is said that he is doing well.

## Trinity.

**WATER SCARCE.**—*Trinity Journal*, Dec. 18: While a little "wet" keeps coming all the time, it is so far not enough to do much good. The rainfall during the past week measured 64-100 of an inch, making the total for December 5.51 and for the season 9.53 inches. Hydraulic miners are working some, but the water supply is limited.

## Tuolumne.

**THE BASIN G. M. Co.**—*Independent*, Dec. 18: The Basin mine, we are happy to state, is in a fair way of purchase by Senator Jones & Co., of Nevada. This mine is about three miles southeast of Confidence, and was formerly owned by the Lewis brothers, who, it is said, have taken \$90,000 out of the vein. The company has determined to thoroughly explore this fine old mine, under the management of Frank McCann. Boilers and machinery are now on the way to the mine; also a new road is being built off north from the Buchanan road. Men were sent into the mine last Monday. Messrs. Frank McCann and James Hamilton have been for months past spending considerable money in cleaning out shafts and tunnels which developed sufficient richness to induce the senator to take hold. From the amount of the expenditures now about to be placed on the property, no doubt is entertained but that the mine will be ultimately bought, probably when the bond expires.

**THE LOUISIANA MINE.**—We also hear that this mine, at Cherokee, will receive some attention at the hands of the same company, but the mine has to be unwatered.

**HYDE.**—We expect that the Hyde mine will be shortly started up by some capitalists. This is a very fine piece of property. There is a very large amount of ore on the dumps, which is good-paying, milling material. The sulphurets are high grade—which carry about three per cent; vein in places 26 feet; water in any quantity—either high pressure or free water by overshot wheel; timber in abundance, and every facility for working. The old contract expired on the 15th. This mine will resume almost directly. There is no question but this is a very valuable property.

**GOOD ROCK** is being taken out of the Buchanan mine, and the mill is pounding away lively. There is no waste in the vein; all the ore being worth milling—which proves the high value of this property.

**WOOD AND MINES.**—Mr. G. C. Baker has been awarded the contract to furnish 500 cords of wood for the Buchanan mine. Eight cords of wood per day is consumed at the mine, or nearly 3000 cords in a year. When Mr. Baker gets to work on his contract, there will be about 80 men engaged in work for the company. Our readers can understand by this that when a few of the many good mines in this county are being vigorously developed, it means the employment of a large number of men and the immediate circulation of large sums of money.

**SOULSBYVILLE.**—*Cor. Union Democrat*, Dec. 17: It is reported that several mines in the mountains will be started the coming winter. Experts from below are around investigating all the mines lying idle. From indications now there is no doubt but there will be the liveliest times in the mountains shortly than there has been for years past. Mr. Frank McCann, one of the parties who has the Basin Slope mine bonded, returned from San Francisco last Friday. Work will be commenced on the Basin mine this week. A survey was made this week for a new road from the Buchanan mine road at a point near Duckwall's to the Basin mine, a short distance of five or six miles. A 40-horse power boiler and engine is on the way from below, and will be taken to the mine and put in place as soon as the road is completed. A quantity of freight has been taken to the mine, and there will be considerable work done this winter. It is a first-class property. Assessment work is being done on the extension Louisiana mine. Soon as water can be had to run the hoisting works, the water in the Louisiana mine will be taken out. It is rumored that a company is expected up in a short time to commence work on the mine owned by Summers & Winwood on Long Gulch. Assessment work is being done in the Raymond mine at the south end of town; it is a good property if a few hundred were expended to open it. In working out the assessments on the Summerset mine at Spring gulch, a two-foot vein was opened showing free gold. Very rich rock was taken out of this mine many years ago. With further developments it may make a fine property. Mr. Wm. Sherwood, of this place, is one of the principal owners. It is reported that Scott and Dove will return in a short time to start their mine, the Black Oak. J. Mitchell & Co. commenced hauling rock from their mine to the Soulsby mill on Monday of this week. Messrs. Riley Gilkey, Tim Dunton and S. Holmes have commenced work on the Lava mountain near their place prospecting for an old river channel. From indications there is no doubt but what there is an old river bed under the mountain, but machinery and considerable work may be required to reach it.

## NEVADA.

## Washoe District.

**CON. CALIFORNIA AND VIRGINIA.**—*Enterprise*, Dec. 18: Daily yield 400 tons, reduced at the Morgan and Eureka mills, giving average assays from battery samples of about \$35 per ton. 1600 level—Lateral drift running south from the north end of the mine extended 37 feet; total, 514 feet. 1500 level—North lateral drift from the Con. Virginia shaft extended 52 feet; total 370 feet. A vein of high-grade ore 10 feet wide has been passed through by this drift, and it is being carried forward to its proposed connection with the upraise above the 1500 level, which connection will be completed very shortly, giving much needed ventilation, when the rich ore mentioned will be further explored. 1435 level—The winze being sunk below the track floor of the east crosscut, after passing through about 30 feet of good ore, is now in inferior vein matter, with stringers of low-grade ore. 1400 level—The vertical winze being sunk below the track floor of the south lateral drift, 300 feet south of the Con. Virginia shaft, having passed through the ore vein, which dipped away to the east, is now in vein porphyry and low-grade quartz. It will reach its connection with the 1500 level the first of the coming week. 1300 level—The lateral drift north from the Con. Virginia shaft advanced 49 feet, making a total length of 501 feet. Material, vein porphyry, clay and quartz seams.

**BULLION.**—At the old Croesus shaft, 400 feet north of the Bullion shaft, new and very efficient hoisting works have been erected during the last three weeks, of sufficient capacity to work to the depth of 600 feet or more. A commodious building has been erected, with a good hoisting or gallow frame, engine, boiler, two safety-cages for the shaft and all other requisites for practical mining work and development. The shaft is 500 feet deep. By means of a hand windlass it was cleaned out and retimbered to the depth of over 100 feet, when the work was suspended until the new steam works could be utilized. The new works were started into successful operation day before yesterday, and the development of the mine will be proceeded with as energetically as possible. The proposition is to repair and reopen the shaft to the 300 level, where a good body of fair-grade ore was developed in the early days of the Comstock. It was thought to extend to the 500 level or deeper, but the present explorations will soon demonstrate the real merits of the matter. All this new development work is being done under the special supervision of Thomas Minifie, who sank this same shaft 23 years ago, at which time he owned the controlling interest in the Bullion mine. On the 300 level, his present objective point, he developed a fine large ledge, over 100 feet wide, of ore assaying as high as \$20 per ton, and extending to an unknown depth. Archie McDonnell remains general superintendent of the mine and works.

**BALTIMORE.**—Under the foremanship of James O'Donnell, one of the oldest experienced mine-managers on the Comstock, being for years foreman of the Yellow Jacket and subsequently the Imperial, this mine is now about to be practically worked and developed for all it is worth. A pipe is being laid from the flume of the water company, a distance of about 2800 feet, to supply the hoisting works, as well the mill near by, with the requisite water. This will be completed in three or four days, when steam will be raised and the works started into operation once more, after lying idle for over a year. The shaft is being retimbered from the 225 level up, the timbers being found to be badly decayed from dry rot. From the 225 level down, the timbering appears to be all right. The proposition after starting up the works is to commence regular ore extraction from both the 225 and 450 levels, where good-paying ore deposits have been found to exist in former workings. This is to be reduced in the five-stamp mill near by belonging to the company. It is a five-stamp mill, but arranged for five more stamps if required.

**SAVAGE.**—500 level—West crosscut No. 1 advanced and timbered 48 feet, making total length from main south drift 70 feet. This crosscut shows a width of 50 feet of fair ore. 600 level—South lateral drift extended 40 feet, making connection with main Savage shaft last Friday night. The whole force of miners on this level are employed excavating a large working station at the west side of the main shaft. The winze now being sunk below the 600 level is down 37 feet and continues in fine ore. 800 level—South drift advanced and timbered 87 feet. No crosscutting yet. 1640 level—The Suro Tunnel Co. has extended its track to the openings in the east quartz body on that level, which is now being explored. The hoisting works and surface machinery of the main Savage shaft are being thoroughly overhauled.

**QUINN MINE.**—Work has been actively resumed in this old mine, below Silver City. It is the old original Quinn mine, located by Col. Pat Quinn, over 20 years ago, and not the Haywood, south of American Flat, which he has been successfully working for the last year or two and getting rich. Several carloads of lumber, shaft timbers, etc., have been received, and new hoisting works will replace those which were destroyed by an explosion of giant powder five years ago, since which time the mine has been allowed to lie idle. The old shaft, which is 200 feet deep, is to be sunk 100 feet deeper as soon as the requisite repairs to the shaft are completed. Good works are in process of erection, and it may not be many weeks before the Quinn will be shipping bullion.

**BEST AND BELCHER.**—600 level—East crosscut No. 1 was advanced 20 feet, making a total length of 713 feet. East crosscut No. 2, 90 feet further to the northwest, has been extended 30 feet; total, 172 feet. West crosscut No. 1, opposite the last mentioned, is in 20 feet. All three of these crosscuts are in favorable vein porphyry and clay, with an occasional streak of quartz. 800 level—East crosscut No. 1 has been advanced 30 feet, making a total of 141 feet. Material, hard porphyry. 1500 level—The reopening and repairs to the station are progressing well, and the north lateral drift has been reopened and repaired to the extent of 76 feet.

**HALE AND NORCROSS.**—1300 level (eighth station)—Southeast drift advanced and timbered 30 feet. The face of this drift is in quartz, giving low assay. Seventh station level—The south drift from the main west drift has been extended and timbered 35

feet. On the same level the north drift has been advanced and timbered 20 feet. Work generally throughout the various levels of the mine is being actively prosecuted.

**CHOLLAR.**—The clearing out and repairing of the old shaft has extended to the depth of 375 feet. 350 level.—The lateral drift south from the Sharon shaft is making good progress in vein matter. An upraise is being made in the high-grade ore body, found near the Potosi line. This is up about 15 feet, in the same quality of ore.

**IOWA.**—Superintendent Curtis has commenced operations by exploring all three tunnels, in order to get a proper knowledge of the ore developments reported to have been made in the former workings of the mine, before starting the surface machinery at the shaft into operation. He is running tunnel B for the middle ledge of the mine, and within the last two days has cut a fine stringer of quartz, lying very flat, which prospects from \$8 to \$15 per ton in free gold.

**OPHIR.**—1065 level.—The main south lateral drift was extended 42 feet during the week. Material, favorable-looking vein matter. 1300 level (corresponding with the 1435 of the Consolidated California and Virginia). East crosscut No. 1, from the south lateral drift, 200 feet north of the Ophir shaft, was extended 22 feet in good-looking vein matter.

**POTOSI.**—250 or old Potosi tunnel level.—The south winze being sunk below the track floor of the Lindsay drift is down 15 feet, and continues in the same high-grade ore developed by the drift. This ore body is 95 feet long and 24 feet wide, and its upward and downward extent remains to be ascertained.

**ALTA.**—700 level.—The main south lateral drift along the east side of the Keystone ledge, in Alta ground, makes the usual advancement, with no features of interest to mention. The winze sunk from west crosscut No. 2 has connected with the 800 level and a crosscut west is exploring the good ore vein extending down from the level above.

**UNION AND MEXICAN.**—1300 level.—The joint north lateral drift and crosscut east from it are both making good progress in favorable working ground.

**ALPHA AND EXCHEQUER.**—The surface hoisting machinery is all on the ground, and being placed in position.

**OCCIDENTAL.**—The lateral drift south from the incline winze, 48 feet below the track floor of the upper tunnel, is out 53 feet. A few tons of low-grade ore is being extracted. Upraise No. 2 from the lower tunnel is in low-grade ore.

**UTAH.**—472 level.—The main west drift from the station advanced 30 feet, making a total length of 550 feet. The face continues in very favorable vein formation.

**SIERRA NEVADA.**—520 level.—West crosscut No. 5 from the north lateral drift was advanced 20 feet. Material, principally birdseye porphyry and very hard.

**JUSTICE.**—350 level.—The drift south from the old Woodville shaft is making good progress in low-grade ore.

**CROWN POINT AND BELCHER.**—Daily yield, 375 tons, principally from the 1600 and contiguous levels. The old mining sections are being closely scratched and worked for all they are worth.

**YELLOW JACKET.**—Daily yield, 150 tons, low-grade ore reduced at the Brunswick mill, on the Carson river.

**KENTUCK.**—Daily yield, 50 tons, principally from the 800 level and contiguous points.

#### Hawthorne District.

**THE MOUNT DIABLO MILL.**—Walker Lake Bulletin, Dec. 16: The Mount Diablo Mining Company has begun the erection of a 10-stamp mill at Soda Springs. The work will be prosecuted vigorously, and it is expected that the mill will be finished and running in three months. Ground was broken yesterday with 25 men at work and in a few days the force will be increased to 40 as work progresses on the tracks, mill, etc. Soda Springs will be a lively place from this time on.

#### Eureka District.

**MINING PURCHASE.**—Eureka Sentinel, Dec. 16: Col. Joe Grandelmeyer, of White Pine, with his usual good judgment and enterprise in mining matters, has purchased an interest in Hon. Thomas Wren's mines at Mount Hope, and at once commenced developing the Good Hope mine—one of a series. The Good Hope already has a tunnel in 600 feet, and Mr. G. has put men to work to extend it 200 feet further, believing that he will strike the ore body by the time that distance is reached. He has just let a contract to run 100 feet of tunnel in the Imperial mine on Treasure hill, Hamilton, in which there is a big showing of ore at the present time, and Mr. Grandelmeyer thinks it is destined to make a very valuable property.

#### Pioche District.

**MORE MEN.**—Pioche Record, Dec. 13: Foreman Martin, of the Pioche Con., during the week, has put on a few more men at the mine. It begins to look like business; as many as five or six loads of timber and planks being delivered at the mine per day, for retimbering the shaft, etc.

#### Rebel Creek District.

**ORE FROM THE OHIO.**—Silver State, Dec. 20: The Ohio Company at Rebel creek is having ore hauled here for shipment to Salt Lake City. Pat O'Brien's and F. P. Snapp's teams have arrived with loads, and other teams are on the way here with loads. Two carloads will probably be shipped in a few days.

#### Tuscarora District.

**BELLE ISLE.**—Times-Review, Dec. 17: Belle Isle and Navajo joint crosscut west, 150-foot level, has been advanced 31 feet. A line crosscut east 150-foot level has been started.

**TORNADO CON.**—We cut out a spacious station for winze No. 1 and sunk the same seven feet; at this depth we cut hanging wall of ledge which brought on us such a body of water that we had to suspend operations until we are better prepared to handle the same. We also cut a good-sized seam of quartz (feeder) therein which assayed well in gold and silver.

**NEVADA QUEEN.**—West crosscut, 150-foot level, will soon drain some of the water from the shaft.

South drift from No. 2 shaft has been advanced 23 feet. It has been in vein, but low grade. A crosscut west was started toward hanging wall. It has been driven 19 feet. It is looking very favorable to cut ore. Have had to put in some timbers, in the winze from No. 1 shaft, as it started caving as the water raised.

**NORTH BELLE ISLE.**—Have started to drive the 400-foot level from Belle Isle north line, which will be pushed north as fast as possible.

#### ALASKA.

**RICH IN MINERAL.**—Alaskan, Dec. 2: The country is rich in minerals, has the largest and perhaps the best-paying gold quartz mill in the world, and many known veins of valuable ore and some rich placer ground. But there is no demand for more labor, and indeed not enough to keep busy that now here, and no bookkeeper or salesman need come here expecting to find employment. There is some demand for mechanics, but it is not certain and steady yet. Prospecting is extremely difficult, and in short no man ought to come here now unless he has the means to stand some period of unprofitable experiment. The mining season opens from March to May, according to season. Parties going to the Yukon pass here, and many intend next season to start in February and use snowshoes as a means of transportation over the trail to the headwaters.

#### ARIZONA.

**AROUND PRESCOTT.**—Courier, Dec. 15: Tom Roach has leased a portion of his rich silver mine to Ryan & Flores, who will sink, drift and stoppe. They are to have two-thirds of all ore that may be taken out by them. Outside of chloriding, not much is being done in Turkey Creek district, but by spring, extensive mining and milling will be started. Mr. T. J. Nolan went to Groom Creek district Sunday last and took a look at the Nevada mine. He liked it and tells of having seen a great deal of good gold rock on the dumps. He found pretty deep snow in the mountains at the head of the creek. Messrs. F. M. Murphy, Geo. S. Porter and others have incorporated the Quality, a Hassayampa district mine of fair reputation. St. Louis capitalists have subscribed \$400,000 to work copper mines in this section. W. H. Meginniss and brother have taken their dry washing machine to Black Canyon creek. They say it saves the finest particles of gold and works two cent gravel with a profit. Gold is being shipped from the Del Paso mill, and silver from the Tip Top.

**PLACER MINING.**—Florence Enterprise, Dec. 16: The Gila River Gold Mining Co. was organized here last week. The company purpose placer mining on the Gila river in Pinal county, and with this object in view have purchased of Mr. J. F. Sanders the exclusive right to use his recently invented and patented amalgamator and concentrator along that portion of the Gila river lying within the boundaries of Pinal county, and also for a distance of 10 miles on either side of the stream. The contract also gives the company the exclusive right to manufacture and sell said machine within the district described. Mr. Sanders is now superintending the construction of a 4-foot machine for their use. He will remain here till the machine shall have been placed in successful operation, and will then go to other fields. The company is composed of Messrs. Julius O. Fischer, Geo. F. Meek, Charles Rapp and Thos. F. Weedon, who hold equal shares. The Sanders amalgamator and concentrator is not an experiment. Its capabilities have been demonstrated by the severest practical tests.

#### COLORADO.

**COLORADO CENTRAL.**—Georgetown Courier, Dec. 16: The product for November was 111 tons of ore, which sold for \$20,227.

**MENDOTA.**—The output for November, 87 tons, 625 pounds of ore, valued at \$5649.02.

**ONKIDA.**—A vein of ore 52 inches in width has opened up, which mills about \$100 a ton in gold and silver, and about 60 per cent in lead. Twenty men are employed.

**VICE-PRESIDENT.**—The lode has been leased to Ralph & Co., who, we understand, are prepared to put the property in productive shape. It is located near the Seven-Thirty group.

**DOVE'S NEST.**—The Woodburn Mining and Smelting Company, which is erecting the smelter at the mouth of Chicago creek, has leased and bonded the Dove's Nest lode on Seaton mountain, and started work. Sinking will be commenced soon, when a plant of machinery will be erected.

#### IDAHO.

**MINING BY THE FATHOM.**—Wood River Times, Dec. 15: William Whitley, an old miner who has had over 30 years' experience in the mines of California, Nevada, and Montana, called at the Times office, to-day, to request publication of the following statement: Early last month, George Montgomery, superintendent of the King of the West, received a letter requesting him to send 15 first-class miners to Rocky Bar. Mr. Whitley, three comrades, and others, went there at once, paying their own expenses. When they got there, they had to wait a week before going to work, when they were set to work, in hard blasting ground, on contract, at \$22 per fathom. This system has just been imported to this country from Cornwall, England, by Mr. Penberthy, foreman of the Ida Elmore Mining Company. A fathom is six feet long and six feet high, by the width of the ledge—whether the latter be one foot or 20. The work was worth \$35 per fathom. At \$22, the men could not earn their salt, yet they had to pay \$9 per week for board and lodging. Of course, the miners quit, and as they could not get work unless by the fathom, they were compelled to return to Wood River. Mr. Whitley and his comrades, therefore, desire the Times to warn all miners to keep away from Rocky Bar, at least until the fathom system of measurement is broken up, as they cannot make half wages at present. By very hard work they may make \$2 per day, and thus earn \$3 per week, after paying their board and lodging.

**THE CAMAS NO. 2.**—Parties who visited the Camas No. 2 mine yesterday, state that the new development on the 200 level is proving immense. The crosscut from the bottom of the shaft is 24 feet in, and has not cut through the ledge. The ore is

very rich, samples having assayed from \$75 to \$200 per ton. This development, being at a depth of 200 feet, demonstrates the downward continuation of the ore body from the surface to that depth, and proves the Camas No. 2 to be a million-dollar property, at least.

**MINING SALE IN SEVEN DEVILS.**—Idaho Statesman, Dec. 16: The Seven Devils mining district, in Washington county, which was first discovered many years ago, has not achieved any prominence as a prospective mining center until the past few years. About the heaviest operator in that district of late has been Mr. Levi Allen, of this city, who has acquired the ownership of a large proportion of the most promising claims in that section, upon which he has expended considerable money. Last fall Mr. Allen took in a large quantity of machinery and mining supplies. From an exchange we learn that the Peacock, White Mountain and Helena claims, which were owned by Mr. Allen, in company with Gov. Hauser, of Montana, and I. I. Lewis, of Ketchum, have been sold to Albert Keinschmidt, the millionaire banker and mining capitalist of Montana. The price paid for the claims is \$80,000, and the purchase price has been paid and transfer consummated. They were located in 1877, and a shaft about 50 feet deep has been sunk, and a number of open cuts run in on the ledge. The ledges are all rich in copper, and carry a large percentage in silver and gold.

#### MONTANA.

**BONDED.**—Anaconda Review, Dec. 16: The Southern Cross and Pleiades claims, located about one mile north of the Pyrenees mine, near Georgetown, have been bonded to Matt H. Ormand, an agent for a party of capitalists, for a period of six months. The Southern Cross, the best developed of the two locations, shows a very large outcrop. Two open cuts, each about 50 feet wide and 15 feet deep, have been run across the vein, which measures 20 feet in width and produced 600 tons of ore, 140 tons of which was milled and yielded \$8 per ton in gold. The shaft has been sunk to a depth of 35 feet at a point on the vein between the two open cuts, which exposes a vein 25 feet wide. Mr. Ormand left town yesterday for the mine, taking with him several miners who will be put to work at once sinking a 100-foot shaft on the vein. Then levels will be run and a regular system of crosscutting and exploring will be begun. Should the developments prove what is anticipated, the company will erect a 60-stamp mill early in the spring. The Moulton Mining Co. has declared dividend No. 11 of 7½ cents per share, aggregating \$30,000, to be paid on the 20th. For the month of November the Montana (Limited) Mining Co. worked 3750 tons of first and second-class ore, which produced \$189,100 worth of bullion, or saving a little over \$50 per ton. The company has 120 stamps in successful operation on the property.

**THE IRON-CLAD.**—This claim is of recent location, and is on Clear creek in what is called the Boulder country. The Iron-clad is a monstrous ledge, measuring as much as 30 feet and more from wall to wall, and consists chiefly of iron oxide, carrying lead, on the surface, and bearing lead carbonates at a slight depth. It is in lime formation, and of such a general character as to promise a rich mine. Numerous sample assays from all parts of the vein, which is nearly the width of the ledge, run well—from 40 to 100 ounces in silver, and a good per cent of lead. The owners are now surveying for a patent. A big strike is reported on Rock creek, in both placer and gold quartz ledges, and there is a general revival of prospecting and developing in that locality. A big "blanket" lead of silver ore has been struck in the vicinity of Henderson's gulch and is now being developed.

#### NEW MEXICO.

**THE STEIN'S PEAK MINES.**—Silver Bell, Dec. 18: The latest mining excitement is at Stein's Peak, N. M., within a few miles of the Southern Pacific Railroad and close to the Arizona line. The recent sale of the Beck mine, by Messrs. Smith, Weyman and Kemble to E. B. Gage and Charles Leach, of the Grand Central, attracted considerable attention and caused an influx of prospectors from Eastern Arizona and Southwestern New Mexico. According to the Lordsburg Advance, the former owners of the Beck mine are still in possession of the most promising claims—the Volcano and the Pocahontas. These are spoken of as the best developed as well as the richest and most extensive ore bodies in the county. In the Volcano the vein is 18 feet thick, all ore, and the wall has not been reached yet. The ledge crops out and is located for a distance of three miles. There are said to be other fine claims in the Kemble district, as it is named. A town site has been laid out and the town will be called Evansville.

**SOCORRO NOTES.**—Bulletin, Dec. 16: A new strike of manganese and peacock iron has been struck in the Jane Bowman, which greatly encourages the owners of that claim. Mike Wallace is striking it rich in the iron mine and Georgia Belle. These are the properties of which Mr. Wallace sold a one-third interest to A. A. Franzheim. As an index of the attention mining is receiving in New Mexico, we cite the fact that four new plants are projected, three of which will be located in this city, one of them for the treatment of copper. The Solitaire mine at Kingston was sold recently to Jeff Reynolds, the Las Vegas banker, for \$10,000. Some remarkably high-grade ore was taken from the Solitaire at one time, and it may yet prove a valuable property. The Hubbs smelter at Albuquerque was sold recently at an extremely low figure. Four-fifths of the real estate, with the smelter and all its appurtenances, were sold to John A. Lee for \$750. Some of the best citizens in Albuquerque were induced to invest about \$12,000 in this plant, which has been a failure from the start. Socorro is the only successful smelting point in the Territory. Messrs. Patterson & Hartwell on Saturday concluded the assessment on H. Wayne Russell's Silver Wave, on the east slope of the Magdalenas. Our reporter met them on the summit of the range Sunday, when they were on the trail to Kelly. The Star of Bethlehem and the Sulphurett, on the summit of the Magdalenas, are being worked for all they are worth, and are furnishing No. 1 ore. A company has been formed in St. Louis to work the Buckhorn, Buckhorn Extension, Colorado, Greeley, Eureka and the Eureka Extension mines, which are located on

Silver creek, in the Mogollons. The properties were formerly owned by Eli Mader, J. C. Mader, Capt. Cooney and Capt. Burris, of Grant county. Development work will commence immediately. It is probable that the company will soon erect a mill on Silver creek.

#### OREGON.

**QUARTZ AND PLACER.**—Jacksonville Times, Dec. 17: Piping is going on at the Sterling mine and excellent progress is being made. J. N. Casteel is running a tunnel to tap C. C. Beekman's ledges on Jackson creek. Considerable quartz is now being taken out of the mines in Jackson Creek district. If the present weather continues awhile longer a favorable mining season is assured. Some quartz from the Swinden ledge has been crushed in Brown & Co.'s new mill, which has paid well. J. Jensen has contracted with the Jacksonville Milling & Mining Co. to run 75 feet of tunnel at \$7 per foot. The miners of Steamboat district expect to make a good report. There are more of them this season. Many of the miners of Southern Oregon have enough water for present purposes, and it will not take a great deal more of rain to set all of them at work. F. O. Collins, Ed Langley and others who have been mining the bed of one of the creeks in the Big Applegate district, did well. W. H. Swinden has made another rich strike in his quartz mine in Blackwell district. Nothing would help the financial condition of Jackson and Josephine counties more than a wet winter. Hundreds of thousands of dollars will be taken out of the ground this season if there is plenty of water. D. W. Cryder, of Sam's valley, this week showed us some fine specimens of coal, which is said to equal the famous Cumberland coal in many respects. It was dug out of a well belonging to his son, where a well-defined vein exists, and which grows better as prospecting progresses. It is reported that a ledge of excellent coal has been discovered at Dan'l Reynolds's place in Meadow's precinct. The vein is said to be 11 feet wide and to give evidence of being an unbroken vein of large extent. The locators have gone down on it some 30 feet in the prospecting already done. Baumle, Klippel & Co.'s quartz mill has been lying idle for a few days, having crushed all the quartz on the dump. Different parties are busily engaged in getting out a large amount of ore, and operations will be revived quite soon. This mill is of great benefit to the district, and we hope to see it kept busily at work.

#### UTAH.

**REVIEW.**—Salt Lake Tribune, Dec. 17: The receipts in this city for the week ending December 15, inclusive, were \$141,338.35 in bullion, and \$45,989.93 in ore; a total of \$187,328.28. For the previous week, the receipts were in aggregate, \$120,180.39, of which \$69,759.17 was bullion, and \$50,421.22 was ore. Fine bar receipts for the week were \$70,490.03; base bullion, \$15,000; gold bars, \$13,600. The product of the Hanauer Smelter for the week was \$17,605 in bullion. The Bannock sent down from Era, on the 13th and 14th, \$6175 in silver bars. Ore receipts were, for the week, \$33,345.00 by McCormick & Co., including \$7985 from the Queen of the Hills and \$7644.93 by T. R. Jones & Co. The output of the Ontario for the week was 23,113 fine ounces and \$9913.52 in ore sales, a total of \$33,026.59. All goes well. The product of the Daly, for the week, was five bars of bullion, 6850.52 fine ounces, and ore sales to the value of \$7673.12, an aggregate of \$14,523.64. Little is known concerning the Horn Silver, locally. There are reports that the mine has been shipping ore, some of it rich; and also that it will soon make free shipments, to be smelted in this valley, but whether in the company's own smelters or in others, we are not advised. No figures are given, however, of past or prospective sales of ore or bullion.

**QUICKSILVER.**—Salt Lake Tribune, Dec. 12: Parties in from Marysvale say that about two miles from the Lucky Boy another quicksilver ledge has been discovered; that the owners of the Lucky Boy are erecting a furnace which will be ready for operation about the 1st of April. At present they are using a retort that turns out 160 pounds of quicksilver per day.

**THE GOLDEN TREASURE.**—Prior to six years ago the Golden Treasure, known as the Gold Hill, near Silver City, produced large amounts of ore, but it and several other mines there getting into litigation, they were shut down and have been idle ever since. The Golden Treasure, now owned by Thomas Marshall, Alex. Graham and J. E. Dooley, has been prospected lately by sinking a shaft on lower ground than the summit of the old work, and from this shaft a crosscut was made to tap the vein at a depth of 300 feet. Mr. Graham, who is now in the city, received a telegram last evening from his foreman saying that the ledge had been struck, opening up a fine body of rich ore. As gratifying as this news was, it was not unexpected. It is very probable that the Golden Treasure will soon become one of the active ore producers of Tintic district.

**PARK NOTES.**—Record, Dec. 18: A force of men under James Morey is pushing work on the Putnam group, above the Daly, by driving the tunnel further into the hill. It is understood that this work is being done preparatory to getting the property in shape for development on a large scale in the near future. The third large pump for the Anchor arrived yesterday and will be put in one of the lower stations of the mine in a few days. The water is drained to a point near the 500 level, and drifting in soft rock is going ahead with moderate vigor. J. M. Kennelly will keep his force at work all winter on the Great Basin and Scott tunnels. Owing to the almost neutral condition of the roads (being fit for neither wagon nor sleigh transportation) ore shipments to the sampler have been quite light the last 10 days. The Crescent is having some first-class ore hauled down the canyon and piled up at the sampler for shipment.

**ORE AND BULLION SHIPMENTS.**—For the 10 days ended last Monday, the Mackintosh sampler received 338,460 pounds of Ontario ore, 235,920 pounds of Daly and 26,030 pounds of Sampson ore; total, 600,410 pounds. The Ontario bullion shipment for the week was 37 bars, containing 20,801 fine ounces of silver. The Daly bullion product from the Marsac mill for the week was 5 bars, containing 5407 fine silver ounces.

## MECHANICAL PROGRESS.

## American Machinists.

The machinist trade in America developed under conditions different from those that accompanied the growth of the trade in older countries. Our early machinists were little hampered by the outcome of guild restrictions in learning the trade. As the call for crude machinery arose, blacksmiths and wheelwrights formed partnerships to do what may be called millwright work. The men employed in such establishments shared the run of the work. One day a man would be working at the anvil hammering out an axle; next day he might be working on the pattern of a cog-wheel or repairing a bursted pump, or turning a saw arbor.

The rapid improvement in machinery that accompanied the application of the steam engine to transportation produced a demand for men capable of doing machine work, and handy blacksmiths, wheelwrights and millwrights recruited the machinist ranks. Any man or youth who had a taste for mechanical work was welcomed in the trade, whatever may have been his previous occupation. If a youth entered the trade and found he had mistaken his vocation, he could easily withdraw, for no tradition of the craft made it an act of disgrace to withdraw from the business. Only one requisite was essential to success—that of self-reliance as a workman. The colonial attribute of self-reliance impressed itself strikingly upon the early generations of American mechanics, and they retain the attribute as a class to-day. This is to be seen in the capability our machinists have of working along without continual supervision of a foreman. They are proud of their ability to direct themselves, and, as a rule, can be depended upon to work faithfully when the foreman's back is turned. Other nations may have closer workmen, with more delicate touch of hand than ours, but no other country's mechanics bring the combined power of skill and intelligence into their work that American artisans do. To their peculiarity of thinking, while working, may be traced the origin of some of our greatest mechanical triumphs. The ingenuity cultivated by this habit fills our patent office with the records of useful inventions and improvements devised by working mechanics.

When a European workman offers to suggest improvements or proposes to depart from the formal routine of doing work, his originality is generally rewarded with the information that he is paid for working according to directions, not for thinking. He accordingly develops accuracy of hand by repeating operations after an established method. He does not attempt to invent a labor-saving tool or an improvement on the manner of producing work, because he finds no encouragement to try anything of the kind. Our workmen, on the other hand, are encouraged to use their brains, and the best jigs and labor-saving devices used in our shops have been invented by the mechanics who use them. This system is developing the constructive skill of the country, and so intelligence among our workmen is pushing America to the front of industrial nations.—*American Machinist.*

**COMPOUNDING THE LOCOMOTIVE ENGINE.**—In a paper on the improvement and economy of the steam engine, read at a late meeting of the Engineers' Association, the following paragraph occurs: "It seems to me much remains yet to be done with the locomotive. We must burn a great deal less coal for the steam we make, and after we have made steam we must use that steam up more thoroughly. In the short cylinder required by locomotive service, the steam entering at the initial pressure pushes the piston to the opposite end, and it then rushes out of the exhaust strong enough to drive another piston. Of every four dollars' worth of coal consumed, at least two dollars' worth is absolutely thrown away, or, of every ten thousand dollars spent for fuel five thousand dollars are absolutely wasted. How can we save this? It would seem obvious, that if steam rushes from the exhaust of an engine strong enough to drive another engine, the common sense of the thing would be to put another engine alongside and let the steam drive it, and we should get just so much more out of four dollars' worth of coal. It seems evident that we must follow the lead of the steamship men and compound the locomotive engine, as they have done with the marine engine."

**STEEL VS. IRON.**—A Danbury firm which deals largely in blacksmith's supplies stated recently that they had been much surprised by the fact that although steel had dropped in price to the level of iron, the use of steel for miscellaneous purposes had not increased so rapidly as they had expected. They put in a full line of steel for wagon and carriage tires, horse and ox shoes, etc., and more particularly of carriage and wagon axles and nails, fully expecting to gradually decrease their purchases of the iron, and finally—especially in case of axles and nails—to drop them altogether and sell nothing but steel. For awhile, owing partly to the novelty of the thing, and partly to the selling quality of the word "steel," the commodity had a large sale. Presently the "smiths" complained of the hard work, and began to go back to iron for horse and ox shoes, being much more easily worked, and as less likely to split out at the creases—until now the firm is again buying and selling 10 tons of horse

and ox-shoe iron to one ton of steel for this purpose. For tires the result has been different, especially in light sizes. The light steel tire has evidently come to stay, and the sale of iron for this purpose, say one by one-fourth inch and under, has almost entirely ceased. Owing to the trouble in bending and welding the heavier sizes in steel, iron is still the favorite.

**WELDING BUGGY SPRINGS.**—A correspondent of the *Blacksmith and Wheelwright* writes to that journal as follows: There have been several questions asked in regard to welding buggy springs. My way is to draw the broken ends to a sharp edge, split them three-quarters of an inch, then drive one end down and the other up, and lap or dovetail them together. I have a clean fire, and heat very slowly. I use powdered borax, and if one lap fails to weld on the first heat, I raise the lap with a chisel and slip under a piece of sheet iron, and then it is sure to weld. But all springs are not alike. Where they are very difficult to weld they will waste, and when this happens, I take a piece of good iron, lay it on the bottom, then weld up, and when it is dressed and bolted together no man can tell where the welding was done without looking very close. I never temper in water, but take a light hammer and hammer till the spring is nearly cold. I have a right to believe in this, for I warrant my work, and have never had one spring come back. My price is 50 cents.

**THE COLORING OF METALS.**—According to the *Illustrirte Zeitung für Blechindustrie*, a grayish-black coloring on copper may be obtained by placing the object for treatment, after being well cleansed, in a weak solution of liver of sulphur. When a caustic effect has, after a short time, been produced, the object is rinsed, slightly heated, and brushed with a stiff brush. This coating is said to be very durable. A blackish-brown bronzing can be applied to vases, figures, busts, etc., cast from zinc, by the application of a solution of sulphate of copper. If the projecting portions are then well rubbed with a woollen rag, they assume a coppery red brilliancy, which increases the resemblance to genuine bronze. A solution of verdigris in vinegar also produces an effective bronzing. Brass may be colored black by repeatedly coating the cleansed metal with a moderately warm solution of nitrate of copper. Heating over a charcoal fire follows. Finally, the tone is heightened by rubbing with olive oil.

**LUBRICATING OILS.**—An undoubted authority on the subject of lubricating oils is thus quoted by Prof. Hele Shaw: "Bearing in mind the natural and almost ineradicable tendency of animal oils to develop acid, and of vegetable oils by absorption of oxygen to gum and clog bearings, and to induce spontaneous combustion; bearing in mind that mineral oils can now be obtained in every respect as safe as the finest animal oils, and that the admixture of mineral oil with animal or vegetable oil neutralizes the acidity in the one case and the acidity and oxidizing tendency in the other, I am of the opinion that the safest, most efficient and most economical lubricants for all manner of bearings are to be produced by judicious mixtures of animal or vegetable with good mineral oils."

**PISTON VALVES FOR LOCOMOTIVES.**—According to M. Ricour, piston valves in locomotives wear at the rate of one-twenty-fifth of an inch for every 125,000 miles of run; while with slide valves the same extent of wear takes place in 2200 miles of run. The effect in the consumption of fuel is also quite noticeable, as shown by actual record carefully kept. At the Saintes Station, in France, the returns made in 1882, during the time in which all the engines worked with slide valves, the coal consumed per 1000 tons of freight conveyed one mile was 226 pounds against 234 pounds in 1884, when 30 out of the 40 locomotives had been fitted with cylindrical valves.

**A NEW CHILL FOR CASTING CAR-WHEELS** consists of a solid continuous casting with its chilled surface separated into segments or sections by the process of casting, and has numerous air passages running through it from top to bottom, whereby the heat alone of the molten metal poured into the chill will cause the inner diameter to contract, while the air prevents the expansion of its outer diameter.

**THE PULLEY GRIP.**—An English inventor claims that the grip of a pulley on belting may be increased by covering the pulley with a thin perforated metallic cover, fastened by screws, rivets or solder. Among other advantages, it is said that the strength of the pulley is materially increased, the hold of the belt improved, and it is possible to run with slackier belts.

**CAST STEEL** is steel that has been melted in a "pot" and poured into a "mold," thus becoming an "ingot," which is afterward hammered or rolled into the size required. It may be of various "temper," varying in percentage of carbon, which they contain from three-quarters or less to one and one-half or more.

**LUBRICANT FOR BRASS.**—An excellent lubricant that will not corrode brass and will last for weeks is made of one part of melted India rubber (not vulcanized) and two parts of common vaseline.

## SCIENTIFIC PROGRESS.

## The Bee's Sting Useful as Well as Hurtful.

It is well known that honey from cells which have not been capped over by the bee will not keep. Honey taken from the hive in that condition soon sets up a fermentation which is destructive of that toothsome and useful product of "the little busy bee." Mr. W. F. Clarke, of Canada, has recently been making some careful observations, from which he claims to have discovered the cause of the difference between honey which has been capped over and that which has not been thus completed. He says: "My observations and reflections have convinced me that the most important office of the bee sting is that which is performed in finishing up the artistic cell work, capping the comb, and infusing the formic acid by means of which honey receives its keeping qualities. The sting is really a skilfully-contrived little trowel, with which the bee finishes off and caps the cells when they are filled brimful of honey. This explains why honey extracted before it is capped over does not keep well. The formic acid has not been injected into it. This is done in the very act of putting the last touches on the cell work. As the little pliant trowel is worked to and fro with such dexterity, the darts, of which there are two, pierce the plastic cell surface and leave the nectar beneath its tiny drops of the fluid, which makes it keep well. This is the 'art preservative' of honey. A most wonderful provision of nature, truly! Herein we see that the sting and the poison bag, with which so many of us would like to dispense, are essential to the storage of our coveted product, and that without them the beautiful comb honey of commerce would be a thing unknown."

"If these things are so, how mistaken those people are who suppose that a bee is, like the Prince of Evil, always going about prowling in search of a victim. The fact is that the bee attends to its own business very diligently, and has no time to waste in unnecessary quarrels. A bee is like a farmer working with a fork in his hay field. He is fully occupied, and very busy. If molested or meddled with he will be very apt to defend himself with the implement he is working with. This is what the bee does, and man, by means of his knowledge of the nature and habits of this wonderful little insect, is enabled, in most cases, to ward off or evade attack. It is proof of their natural quietness, industry and peaceableness that so many thousands of them will go through a summer of ceaseless activity close to your dwelling-house, and perhaps not half a dozen stings be inflicted during a whole season."

## CHARRING AND COMBUSTION POINT OF WOOD.

—In examining into fires presumably due to spontaneous combustion, an important point to be determined has been whether wood will char at as low a temperature as 212 degrees. In tearing down houses for the purpose of rebuilding, the timber in contact with the heating pipes and flues has often been found charred, and it is known, of course, that charcoal is made for certain purposes in the arts at 300 degrees. As the result of experiments in this line, carefully performed in the laboratory, small pieces of white pine heated a few hours in an air-bath at a temperature of 300 degrees were found to be partially converted into charcoal. Under these circumstances, it is thought to be demonstrated that a temperature of 212 degrees is sufficient, if applied for a long time, to convert wood into a partially burned charcoal. As to the next important point—the degree of heat at which charcoal will ignite—it appears that, made from the same wood at different temperatures, the products ignite accordingly; that is, if made at a low heat, it fires from a correspondingly low temperature. It has been determined, experimentally, that charcoal for making powder, when made at 500 degrees, would fire spontaneously at 680, and when wood has been carbonized at 260 degrees, a temperature of 340 only was required for spontaneous ignition. Finally, under certain circumstances, charcoal made at a temperature of 500 degrees even will ignite when heated to 212.

**THE FIGURE DESCRIBED BY A MOVING WHEEL.**—Mr. C. A. Newton, at a meeting of the British Chronological and Astronomical Association, held on Saturday evening, Sept. 25th, in the Memorial Hall, London street, Bethnal Green, introduced a very ingenious and interesting instrument, by means of which, and accompanying sketches, he showed the actual figure described in the air by a nail in the circumference of a revolving traveling wheel, say that of a coach, and conclusively proved that the nail never made a circle, but that its whole motion was that of a series of equal semi-circles, necessarily formed by the wheel traveling on a plane.

**THE AMOUNT OF WATER TREES ABSORB.**—Dr. J. M. Anders, in a geological survey report, gives the results of his inquiry as to the quantity of water pumped from the earth by trees. He finds that the average exhalation from soft, thin-leaved plants in clear weather amounts to about one and a quarter ounces Troy, per day of 12 hours, for every square foot of surface. Hence a moderate-sized elm raises and throws off seven and three-quarters tons of water per day. In the report the facts

are applied to what is going on in America, where certain inland fertile districts are becoming converted into deserts by wholesale clearings; and in other places, such as the plains of Colorado, where only five or six years of irrigation and planting has already produced a measurable increase of rainfall. It is maintained that the deserts of Syria and Africa are the results of cutting down trees, and that original luxuriance may be restored by skillful replanting.

**THE NEW OPTICAL GLASS** to which we have already made reference in these columns, is about to be put to actual test and use. The lenses made from this glass will be known as "apochromatic objectives," which give great superiority in the finer qualities of definition. Professor Abbe claims for this lens that the more perfect corrections permit equal magnifying to be obtained by using a longer focus objective with an eye-piece of higher power than hitherto has been usual, thus obviating some of the difficulties of very short focus objectives. Moreover, the foci for visible and for photographic purposes are identical. Special compensating eye-pieces have also been devised for use with the new apochromatic objectives. We hope soon to be able to give fuller particulars regarding this discovery, and we are glad to be able to say that the new optical glass will be offered to the world without any restriction whatever.

**HOW INCANDESCENCE IS PRODUCED.**—Incandescence is a white heat, or the glowing whiteness of a body caused by intense heat. The little glass bulbs, says an exchange, with their brilliant horseshoe of glowing filament, attract no more attention than the flickering gas-jet. But the facts about the gas-jet are easily and generally understood, while the electric lamp is still a puzzle to many people. Both produce light by incandescence. The molecules of gas are rendered incandescent by the heat generated by the combustion of other molecules. The blue portion of every gas flame is where combustion is taking place, and from there comes the heat which keeps the rest in a state of incandescence. With the electric lamp it is the heat produced by the friction of an electric current compelled to go through a fine carbon filament which raises that filament to a condition of incandescence and produces light.

**ELECTRICITY AND THE INEXPLICABLE.**—Of the common notion that electricity plays an important part in the production of earthquakes, Prof. Joseph Le Conte, of the California State University, well says: "I never heard or read the slightest scientific proof of this theory. Electricity has taken hold of the popular imagination, so that any inexplicable thing is explained by 'electricity.' For example, vital force, nerve force, etc., are inexplicable, so many lay it to electrical force. So also with earthquakes—electricity is made the scapegoat."

**FALLIBLE RECORD.**—Probably few persons realize how unreliable are the unprofessional thermometric reports which are telegraphed in winter over the country after each cold wave, so untrustworthy are even the best of spirit thermometers in unskilled hands. Dr. John Rae expresses the opinion that the thermometer which is quoted as having recorded 58 degrees below zero in Manitoba is about 15 degrees in error. An instrument for the accurate measurement of low temperatures is needed as much as a reliable pyrometer for testing the temperature of molten metals.

**MAGNETISM AND HEAT.**—Scientists are now discussing the curious fact that the usual heat produced by friction is conspicuous by its absence when the articles are magnetized. One example described was where a workman fastened a couple of powerful magnets to his lathe to hold more securely a piece of metal which he wished to drill and turn. The presence of the magnets kept the metal so cold that no water was needed to keep the drill moist—a very unusual circumstance which may lead to important mechanical advantages.

**A "BLACK SNOW,"** which fell in 1875, over an area of about 15 by 20 miles in the vicinity of Holland, Mich., was found to contain a considerable proportion of dark, earthy matter. This was subjected to elaborate scientific examination, and pronounced volcanic dust from some far-distant crater. A dissenter from this view has sought a simpler explanation, and has since proven that the dust came from the prairie soil a hundred miles to the southward.

**A NEW ELECTRICAL EXPERIMENT.**—We learn from *l'Electicien* that M. H. Dunville pledges his scientific reputation to the accuracy of the following observation: If two glasses of water be placed, one upon the north pole of a powerful magnet and the other upon the south pole, in four or five minutes the former acquires a slight alkaline reaction, while that on the south pole becomes slightly acid.

**PURIFYING SEA WATER.**—A Boston scientist predicts that within 20 years chemistry will show how sea water can be made suitable for drinking and for culinary purposes more cheaply for seaboard cities than fresh water can be brought for any considerable distance.

**THE EYES, HAIR AND SKIN.**—Prof. Virchow has completed a very large collection of observations on the color of the hair, eyes and skin of children in German schools, numbering as many as 7,758,287 individuals.

## ENGINEERING NOTES.

**THE ENGINES OF THE FUTURE.**—At no period of the world's history has marine engineering been so full of interest to the professional man, and so wonderful in its practical developments commercially. We have learned that both power and economy lie in what used to be considered unattainable steam pressures, and those now used on sea far surpass those used on land—locomotives not excepted. The highest economy has been shown with the highest pressures, and there are large vessels afloat to-day using steam at 180 pounds per square inch, and small ones at 250 pounds per square inch, with a consumption of coal per horse power which is exceedingly small. Fairbairn told all this a quarter of a century ago in his *Machinery and Millwork* (the title may not be exact), where he asserted that, before many years, pressures of 150 pounds per square inch would be common at sea, and the cylinder flue-boiler universal. This was in the day of the side-lever engine and the "box" boiler, but no one ever gives Fairbairn credit for his prevision. No prudent engineer of this day and time will predict where pressures are to stop. We are able now, with improved forms of boilers, better material and machine tools for building them, to reach any pressure required; and we shall utilize these pressures before many years pass in much less cumbersome and costly machines than quadruple-expansion engines. These now afford the only means for using the heavy pressures alluded to, but we are confident that the inventive genius of our engineers will find better vehicles of less weight and complexity in the fullness of time.—*Mechanical Engineer.*

**THE FIRST ELECTRIC ELEVATOR.**—In the building of the Union Institution for Savings, at the corner of Washington street and Hayward place, Boston, the first elevator worked by electricity is now stated to be in successful operation, it having now been at work for some time. A five-horse power Sprague electric motor, scarcely three feet high, and covering a floor space of less than three feet square, is used. It runs noiselessly and at a constant speed, but the speed drops slightly for a moment when a heavy load is thrown on, regaining the normal speed at once. The power from the motor is used to lift the elevator directly, by means of the ordinary belting, but it might be used for pumping water for hydraulic elevators under either the tank or the air-pressure system. The motor runs all day, but only consumes an appreciable amount of electric energy when the elevator is raised. The throwing on of the belt by means of the ordinary wire rope has no perceptible effect on the motor. The elevator lifts 1500 pounds, is used for freight, and runs at a speed of from 40 to 50 feet per minute, going up five or six stories. A peculiar and important feature of the working of the elevator is stated to be that, when descending, its weight turns the motor armature, and so converts the motor into a generator, supplying electric power back to the line. The power is supplied by the Edison central station, 200 feet distant. Motors operated from the same station are now daily running ventilating fans, printing presses, circular saws, sewing, buffing and other machines in the neighborhood. It is expected that 20 elevators will soon be running by electricity in Boston.

**NEW ARRANGEMENT FOR SCREW PROPELLERS.**—One of the chief objections hitherto to the use of the screw propeller for fast passenger boats has been the excessive vibration of the after part of the vessel, which is inevitable with the old style of single engine, and to some extent with one two-cylinder compound engine. With a view to reducing this source of discomfort to a minimum, the plan has been adopted of having a three-cylinder engine, with cranks at 120 degrees, which has been found to be in this respect a great improvement over anything previously used. These triple expansion engines have open fronts, rendering them entirely accessible in all parts, with steam reversing gear, independent pumps, etc., the arrangement of the feed-water heater and the combination for operating these pumps being such as to remove some of the well-known objections entertained by many engineers to their use. The steam is supplied by a "straight through" boiler with three furnaces, using a moderate forced draught; the boiler is of steel, but strapped inside and out, treble riveted.

**ELECTRIC MOTORS.**—Electric motors are being adopted in Pittsburgh with considerable rapidity. They range from 1-horse to 20-horse power. Many printing presses are run by them, and a number of families use them for operating sewing machines. They are also used for other purposes for which only a small engine is required, especially if heat is an objection. They are so convenient, too. An attachment is made to an electric-light wire, and when it is desired to start the motor all that is required is to press a button and turn on the current. The part that electricity will before long play in our every-day affairs would perhaps sound visionary to estimate or predict.—*Am. Manufacturer.*

The Hudson river tunnel is being pumped out after being filled with water for two years. The announced purpose is to exhibit the work to capitalists to interest them in the completion of the tunnel. Col. Haskins announces that the structure is uninjured.

## USEFUL INFORMATION.

**GLASS RAILS AND GLASS SLEEPERS.**—It was recently, in this and other journals, stated that Mr. Siemens had devised a method by which he proposed to cast glass so that it might be substituted for iron as railway tracks. In regard to this Mr. Siemens writes from Dresden: "As concerns the report mentioned in several English papers about the discovery of producing rails in the same way as sleepers, I must state that the contents of this report are founded on a misunderstanding. German newspapers, which brought their articles regarding cast glass translated from English journals, erroneously translated the English 'sleeper' into the German 'schienen,' signifying 'rails' in English, and it was this mistake which led the English papers to the opinion that Mr. Frederick Siemens has succeeded in manufacturing also rails from cast glass. Allow me to add for public information that a sample of these glass sleepers, recently tested at the Anderson Foundry Company, Limited, Glasgow, resisted a falling weight of 3½ cwt. falling upon a rail placed upon the sleeper set in sand ballast, commencing at 6 inches and rising by succeeding increments of 6 inches up to 9 feet 6 inches—the maximum elevation to which the test ram could be elevated—without effect until the blow had been repeated for the sixth time. Cast-iron sleepers are expected to withstand a similar test up to 7 feet only. The cost of glass sleepers will be considerably less than those of either cast iron or steel, while the material is practically imperishable as regards climatic changes, atmospheric influences or the ravages of such insects as the white ant."

**LOSS OF COIN BY WEAR.**—Professor Kimball, the Director of the Mint, has made a report on the losses on gold and silver coin by wear and abrasion, which are much more serious than most people probably imagine. Though no systematic investigations on an adequate scale have been made in this country to determine the loss by actual wear of United States gold coin, yet we are told the results of such experiments as have been made show that the abrasion of gold coin under past conditions of circulation has been from 1½ to 2 per cent a century, or from \$150 to \$200 per annum per \$1,000,000. The experiment has recently been tried of aiding the public in the discrimination between light gold coins and those of standard weight by stamping light gold coins with the letter L, so as to admit of ready detection. If such experiments continue at the sub-treasuries and mints the director believes that light coins will soon cease to perform the functions of legal tender coin, and coin will be presented for redemption before progressive wear entails material loss. The loss on small silver coins in active circulation is estimated at from one-tenth to one-fifth of 1 per cent a year.

**A NEWLY-DISCOVERED SOURCE OF FIRE DANGER.**—A Philadelphia paper calls the attention to a fire hazard that all old firemen know exists to a greater extent than is generally credited. It says that a source of danger in country houses in which wood is used for fuel, arises from the pyroligneous acid which is formed from the wood in the course of combustion. This corrosive substance is carried up the chimney in the form of steam, and in the higher portion is condensed upon the surface. It gradually eats away the mortar, and the rains wash down the dissolved or loosened portions, till wide openings appear between the bricks. Through these crevices may be blown sparks, which may find congenial resting-places in the cracks of well-seasoned timbers. If it be in the night, the family may be aroused from sleep to find their dwelling already doomed to destruction by a fire whose origin is to them forever a mystery. To guard against this danger there should of course be frequent inspection of flues and all necessary repairs. This applies to cities, as well as to the country. That "defective flue" is responsible for a great number of fires every year.

**TOUGHENED GLASS.**—The following explanation is given as a reason why so little is now heard of tempered or toughened glass for domestic purposes, although a year or two back such glass was much advertised and its praises constantly sung. We understand that the reason why it has at present disappeared from public notice is that its efficiency does not last. When fresh from the factory it can be dropped from a height to the floor and knocked about with impunity. But some gradual and understood change occurs in its constitution, for after a short time it will fly to pieces without any apparent cause. It is said, too, that unscrupulous traders who have a stock of the faulty material are selling it as ordinary glass. Those, therefore, who experience unaccountable breakages will know to what cause to attribute them. A really unbreakable glass would be such a boon that it is to be hoped that further experiment will soon show how it can be manufactured.

**GLUING.**—Experienced wood-workers have always contended that a glued joint, properly done, was stronger than the wood itself. And yet joints often give way at the surface when the glue is used, which is generally accounted for by bad material. But the true cause is one which artisans will seldom admit—lack of skill. In gluing wood the bad work is gener-

ally produced by applying the glue to both surfaces. A good job is always secured by applying the glue hot, but not extremely so, to one surface only, which should be cold, while the other surface should be heated, but no glue on it; by this method the glue will best permeate the wood and bind the surfaces together firmer than nature binds the fibers.

**ANIMAL VS. STEAM POWER.**—A writer in the *Revue Scientifique* affirms that, from a comparison of animal and steam power, the former is the cheaper power in France, whatever may be the case in other countries. In the conversion of chemical to mechanical energy 90 per cent is lost in the machine, against 68 in the animal. M. Sanson, the writer above referred to, finds that the steam horse-power, contrary to what is generally believed, is often materially exceeded by the horse. The cost of traction on the Mont Parnasse-Bastille line of railway he found to be for each car, daily, 57 francs, while the same work done by the horse cost only 47 francs, and he believes that for moderate powers the conversion of chemical into mechanical energy is more economically effected through animals than through steam engines.

**VANITY OF A CANARY.**—The habit of the canary to noisily join in any conversation that may be going on in the family circle is a reason why many refrain from keeping this cheerful little bird as a pet. A naturalist has discovered a way of remedying the difficulty. He says: "We put in our canary bird's cage every day a little mirror, as large as the palm of our hand, taking care that neither sun nor lights shall dazzle him, and he will look at himself for hours together with as much happiness as any young gentleman you ever saw. When we want him to stop singing we have only to give him the mirror."

**RUSSIA** is going to have a railroad tunnel three miles long at a cost of \$3,500,000. She has 15,000 miles of railway, but her only tunnel is 700 yards long. More great works of this kind are contemplated, and as Russian engineers are ignorant of tunnel-making there is a demand for foreign skill.

To keep postage stamps in the pocket or memorandum book without sticking, a New Orleans postoffice clerk advises people to rub the sticky side over the hair two or three times. The oil of the hair coats the mucilage and prevents it from sticking.

A GOOD MOTH POWDER is made of ground hops one drachm, Scotch snuff two ounces, camphor gum one ounce, black pepper one ounce, cedar sawdust four ounces; mix thoroughly and strew among the furs and woollens to be protected.

## GOOD HEALTH.

## Medical Instinct in Animals.

Animals get rid of their parasites by using dust, mud, clay, etc. Those suffering from fever restrict their diet, keep quiet, seek dark, airy places, drink water, and sometimes plunge into it. When a dog has lost his appetite it eats that species of grass known as dog's grass, which acts as an emetic and purgative. Cats also eat grass. Sheep and cows, when ill, seek out certain herbs. An animal suffering from chronic rheumatism always keeps, as far as possible, in the sun. The warrior ants have regularly-organized ambulances.

Latrelle cut the antennae of an ant, and other ants came and covered the wounded part with a transparent fluid secreted in their mouths. If a chimpanzee is wounded, it stops the bleeding by placing its hand on the wound, or dressing it with leaves or grass. When an animal has a wounded leg or arm hanging on, it completes the amputation with its teeth. A dog, on being stung on the muzzle by a viper, was observed to plunge its head repeatedly, for several days, in running water. The animal eventually recovered.

A sporting dog was run over by a carriage. During three weeks in winter it remained lying in a brook, where its food was taken to it. The animal recovered. A terrier hurt its right eye. It remained under a counter, avoided heat and light, although it habitually kept close to the fire. It adopted a general treatment, rest and abstinence from food. The local treatment consisted of licking the upper surface of the paw, which it applied to the wounded eye; again licking the paw when it became dry. Animals suffering from rheumatic fever treat themselves by the continued application of cold water, which M. Delaunay considers to be more certain than of the other methods.

In view of these interesting facts we are, he thinks, forced to admit that hygiene and therapeutics as produced by animals may, in the interest of physiology, be studied with advantage. Many physicians have been observers of animals, their diseases and the methods adopted by them in their instinct to cure themselves, and have availed of the knowledge so brought under their observation in their practice, much to the gain of humanity.

**HOW TO CURE FEAR.**—Fear is a bad habit often formed in childhood, and continued in a chronic form during life. It is to be cured only or mainly by its opposite—courage. M. Richet relates how he had occasion to pass frequently through a forest at night. He entered

it boldly; but after a few steps the feeling of fear came on and he felt highly relieved when he saw the clear sky again. Each night he was able to keep up his bold step for a longer and longer distance, until finally the fear was almost overcome. Habit is the only method of removing fear. Workmen in powder mills know they are in constant danger, but have no fear. To educate a child to be brave, the habit of not fearing in darkness and solitude, and so on, must be taught by its parents and guardians. Most of our nurses make cowards of our children, and it would be about as well for them to grow up without this appendage to their lives.

**CURE FOR RATTLESNAKE BITE.**—Eighty years ago Joseph Geer, the first settler at Long Eddy, N. Y., learned the cure for rattlesnake bite from John Johnson, a half-breed Delaware Indian, who, like most Indians, was an inveterate lover of whisky, and for a pint of it would let a rattlesnake bite him and then cure himself with his remedy, which, however, he would not reveal. Geer always kept liquor in his house, and on an occasion when Johnson was recovering from one of his frequent spells of drinking to excess, and was suffering terribly for the want of liquor, succeeded in getting the remedy for a pint of whisky. Geer kept the secret till from old age he was unable to answer the calls of the settlers when any of them or their stock had been bitten, and then told it freely to all. It is as follows: Apply to the wound a poultice one-half each of common salt and indigo, mixed with cold water, and renew every two hours. Eat freely of the leaves or drink often of tea made from one of a variety of the blue violet (*V. Sagittata*), commonly known as the "arrow-leaved" violet. If the bite be upon the leg or arm, bind the leaves in a circle around it, above and just beyond the swelling. Moistened with cold water as often as they get dry from the fever created by the poison, and renew two or three times a day. During the time this remedy has been in use in Mr. Geer's neighborhood it has effected at least 20 cures upon human beings, a great many more upon beasts, and has never failed with either. Ralph Geer and Moses Thomas, Long Eddy, N. Y., are the names and addresses of individuals now living who have been bitten by rattlesnakes and cured by this remedy without the aid of whisky or anything else.—*Exchange.*

**WHAT IS COCAINE?**—Most people have read of cocaine as a local anesthetic in connection with the treatment of General Grant during his last illness. It was not until 1880 that its properties were fully known, although the wild shrub from which the alkaloid was obtained by Nieman, at the date above given, was in use by the Peruvians as an invigorator before and after the Spanish conquest. The shrub grows as an indigenous product in the mountains of Peru and Bolivia, and is also cultivated. The leaves are dried like tea, and used sometimes in like manner as tea, and are also chewed for the stimulating effect. The plant could be introduced and cultivated in the mountain regions of California with success.

**DEATH FROM YELLOW FEVER.**—In dead subjects of yellow fever, the heat has been known to run up as high as 113° F. three hours after death, when it was only 104° as life passed from the body. The rise of temperature is supposed to be due to a fermentation of the blood. The beneficial results of quinine in breaking up malarial and other fevers are supposed to be principally due to the power the drug has to arrest fermentation and putrefaction. Quinine is an anti-ferment. Malarial fever is supposed to be due to the presence of fermenting spores in the blood.

**SUPERFLUOUS HAIRS.**—Superfluous hairs on the face may be removed by electricity. A very fine sharp needle is pierced into the hair follicle, and a current of electricity passed through it for a moment. It burns or cauterizes the root so that it dies, and gives no pain. If the needle does not pierce the right spot, no good is done. It requires a steady hand, a good eye and a little practice to perform the operation skillfully. About 40 hairs can be removed in an hour by an experienced operator.

**CONSUMPTION TREATED.**—A new treatment for consumption which is attracting the attention of physicians is the injection of remedies directly into the lungs by the hypodermic syringe, the needle of which is passed through the walls of the chest. Some very encouraging cases are reported in which the improvement is so great as to justify one in speaking of them as cures. Carbonized iodine has produced the best results.

**PROLONGED CASE OF HYSTERIA.**—A Neapolitan physician has described a case of hysteria, prolonged and aggravated, in which the nails of the fingers and toes were spontaneously shed. This was preceded by tingling, especially in the thumbs and great toes, followed by suppuration in the bed of the nail. The curious affection of the nails is supposed to have been a result of disordered nerve function.

The world's blind are computed to number about 1,000,000, or about one sightless person in every 1400 inhabitants. The proportion is greatest in Egypt and least in New Zealand. Germany has the greatest number of institutions for the blind, and America is eighth on the list.

SAN FRANCISCO:

Saturday Morning, Dec. 25, 1886

## TABLE OF CONTENTS.

**EDITORIALS.**—Formation in Copper Mines; A Pendulum Hoist, 405. Passing Events; Close of the Volume; Annual Mining Review; Where and How to Set Our Unemployed at Work; Foundry Notes, 412. Concentrating Mills; Mechanical Engineering at the University; Deposits and Purchases of Silver, 413. Liquid Fuel; Mining Accidents; Christmas, 414. Narrowing the Area for Prospecting; Discussing a Patent Bill, 417.

**ILLUSTRATIONS.**—Fig. 1—Section of Metcalf Hill, Showing Copper Mines; Fig. 2—Vertical Cross-Section of Coronado Vein; A Pendulum Hoisting Apparatus, 405. Concentrating Plant with Rolls, Jigs and Duncan Concentrators, 413.

**CORRESPONDENCE.**—A Place for the Gold Where They Find It; Lower Springs, Shasta Co., 406. **MECHANICAL PROGRESS.**—American Machinists; Compounding the Locomotive Engine; Steel vs. Iron; Welding Buggy Springs; The Coloring of Metals; Lubricating Oils; Piston Valves for Locomotives; The Pulley Grip; Lubricant for Brass, 410.

**SCIENTIFIC PROGRESS.**—The Bee's Sting Useful as well as Hurtful; Charring and Combustion Point of Wood; The Figure Described by a Moving Wheel; The Amount of Water Trees Absorb; The New Optical Glass; How Incandescence is Produced; Electricity and the Inexplicable; Fallible Record; Magnetism and Heat; A "Black Snow"; A New Electrical Experiment; Purifying Sea Water; The Eyes, Hair and Skin, 410.

**ENGINEERING NOTES.**—The Engines of the Future; The First Electric Elevator; New Arrangement for Screw Propellers; Electric Motors, 411.

**USEFUL INFORMATION.**—Glass Rails and Glass Sleepers; Loss of Coin by Wear; A Newly-discovered Source of Fire Danger; Toughened Glass; Gluing; Animal vs. Steam Power; Vanity of a Canary; A Good Moth Powder, 411.

**GOOD HEALTH.**—Medical Instinct in Animals; How to Cure Fear; Cure for Rattlesnake Bite; What is Cocaine; Death from Yellow Fever; Superfluous Hairs; Consumption Treated; Prolonged Case of Hysteria, 411.

**MISCELLANEOUS.**—The Golden Age in California; Notices of Recent Patents, 406. The Blue-Bird Mill, Montana; Nevada Mines; River Bed Dredging; An Alaska Forest; West Point Mines, 407.

**MINING SUMMARY.**—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 412-13.

**MINING STOCK MARKET.**—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 420.

## Business Announcements.

Coal—Renton Coal Company.  
Dividend Notice—German Savings & Loan Society.  
Assessment Notice—Golconda Mining Co.  
Dividend Notice—San Francisco Savings Union.

## Passing Events.

The advent of Christmas brings rejoicing to the hearts of the children and kindly feeling among older persons. At this season the cares of business are relaxed to a great extent and all enter heartily into the Christmas festivities. The PRESS is glad to greet its readers and patrons with the compliments of the season.

This number closes Vol. LIII of the MINING AND SCIENTIFIC PRESS. The publishers and editors recognize that the advancement of the mining and mechanical interests of the coast has been greater of late than in the past, and intend that the PRESS shall keep pace with it. They intend to increase its usefulness and value as far as lies in their power, and hope for a hearty co-operation on the part of its subscribers.

During the past week there have been a number of marine disasters on our coast, some of them attended with great loss of life and property. There have been no violent gales, but fogs and heavy seas from off-shore tempests have been the cause of most of the disasters.

The trouble from the labor strikes in the city appears to have nearly ceased, the cars on the

two lines affected being now operated by new employees.

Congress is again in session, and the question of fortifying this port is being brought up. Should the Government decide to go on with large works to fortify our harbor, it will be a good thing for the mechanics and laborers of this coast.

## Close of the Volume.

This is the last number of Volume LIII of the MINING AND SCIENTIFIC PRESS, the oldest paper devoted to the mining interests in the United States. The PRESS has always urged advancing the interests of legitimate mining industry. While conservative in its views and advocating the encouragement of the mining business, it has noticed all the new plans and systems that have been proposed or come into vogue in mining and metallurgy, in order that its readers might know of these things, whether good, bad or indifferent.

Being published in San Francisco for so many years it has been but natural that California industries should have occupied most attention in the PRESS. But this has not prevented our giving publicity to mining events in other sections of the coast. Our correspondents have traveled in Montana, Idaho, Oregon, Nevada, Utah, Arizona and New Mexico, and gathered facts for us. Each week in our mining summary we have given the current news of the various camps of the States and Territories.

The complete index on the last page of this number will show the variety of subjects which have been treated during the last six months. In this index is also a list of all the patents granted Pacific Coast inventors. Each week we give brief descriptions of the more important of these. To our local mechanical industries we also pay considerable attention, making frequent notes of the work going on at our foundry and machine shops.

The various departments of the PRESS are so conducted as to give in brief each week that which is most important in its class.

The mining field has widened materially in the past few years. Many new camps have been discovered and developed. It has been the habit of the editors to collect all possible information concerning the new regions in order that those who thought of going there might be posted.

In one thing, at least, the PRESS can justly claim to be without a rival. That is in illustrating and describing all the new mining and metallurgical appliances, machinery, etc. All the new forms of ore-crushers, mills, pulverizers, furnaces, hoisting works, pumps, etc., have been placed before our readers that they might judge of their merits. The amalgamators, concentrators, etc., have also been illustrated and described. This feature of the paper alone is worth more than the subscription price to any mining man, since it keeps him posted in the progress of his business.

It is the desire and design of the publishers and editors of the PRESS to continue to improve it in every possible way during the coming year. We need the assistance of mining men everywhere to make a good paper for them. And it is not out of place here to remark that the beginning of a volume is a good time to subscribe and to renew subscriptions. The more subscribers we have the better paper can we furnish and the more influential will it be. We shall be glad to receive notes of progress from the different camps at any time, and more especially now at the close of the year, when the result of the year's work is seen.

## Annual Mining Review.

In a few weeks we shall issue our annual mining review, giving a summary of operations of the various mining camps of the coast for the past year. We shall give the bullion product of the year and all the statistics obtainable. We shall be very glad to receive from any of our readers an account of the progress of their camps or mines. Many camps have no newspaper to represent them, and the miners should choose some one to "write it up," in order to keep it before the public. We intend printing a large edition of the number of the PRESS which contains the review, which will appear within a few weeks, just as soon as the statistics are available. Send us what notes occur to you and we will put them in a shape for publication.

## Where and How to Set Our Unemployed at Work.

This city is full of idle men. There are many also elsewhere in California. The entire number in the State amounts to some thousands. These are mostly workingmen who want manual labor, which for the most part they are willing to perform and are capable of performing well. The question is, or should be, with all good citizens, how shall these men be furnished with employment? for this they must have. They cannot live without it. But, under existing conditions, there is no employment for them. If they apply at the factories, foundries or machine shops, they find these full-handed. If they go into the country, the farmers have all the help they want. The lumbermen, the railroad builders, the master carpenters and masons, the contractors and bosses of every trade, are in like manner fully supplied. In the cities there are numerous applicants for every situation, able-bodied men often seeking positions that girls, boys or women ought to fill.

Now, much as we may desire to enlarge the field of labor, not much ever has been or can be done for the accomplishment of that end through the forced establishment of any new industry, whether to be carried on in this city or elsewhere in the State. Enough and too much of this has been done, or at least attempted, already; we see the wrecks of these prematurely undertaken enterprises on every hand. Led on by the press, it has been too much the habit of our would-be teachers, publicists, and even of the people themselves, to clamor for the starting of some new branch of manufacture or other industrial pursuit; everybody upbraiding our moneyed men that so little has been done in that direction. But our moneyed men, after a not very happy experience in this line of endeavor, are not desirous of enlarging that experience. Of the enterprises they have helped to set on foot, many are languishing, some are dead, a few, that ought to have met with enough support to keep the life in them, being unhappily in this last category. The Clipper Gap Iron Works are not, and the Oakland Antimony Works are not, and a good many establishments that the impecunious, public-spirited citizen hurrahs for seem likely to be soon relegated to the same condition.

## Utilize Our Natural Resources.

Let us not beguile ourselves, then, with the hope that employment can, by this process of nurturing untimely enterprises, be furnished for this army of men who are waiting for something to do. Let us look about, rather, and see if something better than this cannot be done for them. Let us examine our natural resources and see if by utilizing them a better field for the profitable employment of this surplus labor cannot be opened. We have, of late, enlarged a good deal on the opportunities that exist, or could easily be created, in our California gold fields for the profitable employment of much labor. We expose ourselves to the charge of iteration by recurring to the subject. In what has so recently appeared in the PRESS, we took occasion to speak of the great extent and variety of our mineral resources and their favorable surroundings. We pointed out the accessibility of

## Our Mineral Districts.

The excellence of the climate, and the security to life and property that there obtains. But these are things with which most Californians are sufficiently well acquainted. There is, however, another aspect of the business with which many are not now so familiar, because matters in the California mines have greatly changed since the early days. Then any man could go out into the diggings and employ himself, or readily find employment; now it is different. He must have some means to do this. If destitute himself, somebody will have to furnish him with money, or he cannot go into the mines and there avail himself of the opportunities open to all, but which none can turn to account without a stake to start with.

We would suggest, therefore, that our business men and capitalists, and all who have the material prosperity of the State at heart, adopt the plan of extending to such of our unemployed population as may desire it enough aid to enable them to

## Get Out Into Our Gold Fields

And there set themselves to work. The sum required for this purpose would not be large,

nor would the party advancing it run any great risk of losing it in the end. Not only so, but in most cases it would be returned to him many hundred fold. This plan of outfitting the miner was at one time much in vogue all over the Pacific Coast, and was generally found to work well. To it many of our rich men owe their fortunes. Though it has of late years fallen into disuse here, it is still largely practiced in most of the newer mining countries lying to the east of us. It might to good advantage all round be revived in California. There would be less risk in advancing money for such purpose now than aforesaid. The prospector is at the present time much less nomadic in his habits than formerly. All his habits are, in fact, better. The field of his labors is more restricted. There is nothing to tempt him out of California. If helped, he would always be within hailing distance. The object of his search would be for the most part gold-bearing quartz. Having found a deposit of this kind, his business would be to stay by and develop it. His partner would always know where he was and what he was doing. The chances for getting hold of a valuable quartz vein, either by location or purchase, are in many parts of the mines extremely good. In a few years this will be much more difficult. They are therefore good things to go after. Once secured, the owners of these properties can develop them at their leisure. They will keep. In a little while, even though not much opened, they will be in demand, and

## Now is the Time to

Look them up and reduce them to possession. But the investor must remember that it requires a little more money now for promoting a venture of the kind here proposed than it did in primitive times. The old-fashioned "grub-stake" will hardly do, as the miner, instead of roaming the mountains, is to become a fixture; he must have a cabin for shelter, be furnished with a more full stock of provisions, tools and other supplies. Still, a few hundred dollars will suffice to outfit and keep him in the field for a year, during which time he will, in nine cases out of ten, have succeeded in getting hold of something valuable. We do not believe that parties having means to spare could invest them or a portion of them to better advantage than in the manner here suggested. We hope to see some trials made of this plan, and in the event of this being done shall watch the issue with interest.

## Foundry Notes.

Work at the foundries is a little more active of late, and much better times are anticipated.

At the Pacific Rolling Mills they are engaged in making the yokes for the new cable railroad across the city. Work was recently commenced on Washington street. The mills will have considerable of the iron work to do on this road, outside of the yokes.

The firm of Hinckley, Spiers & Hayes, of the Fulton Iron Works, have signed a contract to build an engine and steamer for the coasting trade. This vessel is the sixth of her class built by the firm during the current year. She will be 120 feet between perpendiculars, 31 feet breadth of beam, 10 feet deep, and will be furnished with compound high-pressure condensing engines of the latest type and of 175-horse power. Work will be commenced immediately on both hull and engines.

The Pacific Iron Works are now building a 200-horse power Hazleton boiler for the Spring Valley Water Company, in addition to the jobs we mentioned in last week's PRESS.

It will be remembered that when the Union Iron Works, of this city, bid on the new Government cruisers, their bids on two of them were the lowest, but that the lowest bid on the first one exceeded the specified amount, so that they only got the contract on the Charleston. Congress has now authorized a larger expenditure, and the Secretary of the Navy will either re-advertise for bids or award a contract. It is likely that the Union Iron Works will get this job too, and it is sincerely to be hoped that they will.

THE Hecla Consolidated paid \$1,047,500 in dividends up to September 1st. The furnaces were then shut down, to be overhauled and rebuilt on a larger scale.

ANTIMONY is selling in Liverpool at from £29 to £30 per ton.

## Concentrating Mills.

The mining industry has received an impetus during the last six months which seems to indicate that during the next year we may look forward to even greater activity in mining generally than during the famous bonanza years, when interest was confined to one locality. The many methods and appliances which have been perfected during the past seven or eight years have made it possible for the large quantities of low-grade ores to be worked at a handsome profit. Not only this, but at numerous points in and adjacent to mining districts, plants for reduction of ore have been erected, which enable small mine-owners to dispose of their ore. This healthful condition and activity of the mining industry can, in a measure, be traced to the development and perfection of the process of ore-dressing or concentration. This system has long been practiced in Germany and certain parts of Europe; but owing to the fact that their methods required much labor, they could not be economically introduced into the mining districts of the United States. This state of affairs called into play the inventive genius of our mining men, and to-day we are employing methods and appliances, the operations of which in ore-dressing leave very little

high-speed rolls, which reduce it to the proper size, and it is again elevated to the first revolving screen.

The jig and its operation is so well known that it needs no description at this time; but as the jig is adapted to treat only moderately coarse material, the "slimes" and fine material must be handled by some other appliance. In the illustration shown, the Duncan concentrator is employed for this purpose, the results of its work being found to be very satisfactory. The product obtained from this process is generally shipped to reduction works and paid for as soon as the value is known.

The process is a very cheap one, in many instances costing not more than 50 cents per ton of ore. Mines which heretofore were considered worthless have been converted into valuable properties and are yielding to their owners handsome returns.

CAVE IN THE YELLOW JACKET MINE.—A dispatch from Virginia City, dated the 20th, says: The rumors current that the Yellow Jacket management were preparing to start a ponderous pump at the new shaft for the purpose of draining the mine arose from the fact that smoke was observed issuing from the stacks to-day. Steam was gotten up for the purpose of

## Mechanical Engineering at the University.

In accordance with the drift of modern opinion and custom, that practical instruction in the use of tools and machines should be given to students in special branches, a committee of the faculties of the University of California is now at work upon the question of revising the course of study in the various colleges. One of its recommendations will be that shop-work be made obligatory for at least three hours each week for the freshman year in all the scientific colleges. Professor Hesse has prepared a plan by means of which this work can be done. President Holden recognizes the importance of the mechanical engineering department, and wants to see the freshman classes of all the scientific colleges receive practical instruction in the simple forms of mechanical work. He thinks they should have at least one year of practical shop-work.

The present work-shops are arranged for fine work, and are occupied by the older students, not being suitable for elementary instruction. The president is of the opinion that the most economical way to carry out the plan proposed would be to build a small building 28x90 feet, specially for the purpose, to cost about \$3500.

fixed in his mind in this way, and in no other. In the institution with which I am best acquainted, namely, the University of Wisconsin, 865 hours are required of all students in mechanical engineering, and the experienced and competent professors there say that this time is not too much.

"Shop-work which has been done outside of the University should be credited to the student at a value of half the number of hours actually spent in the work. It should not count for more than that number of hours, because instruction in the University shops will be directed to the elucidation of mechanical principles, whereas in ordinary shops the object is to make commercial success."

## Deposits and Purchases of Silver.

The total value of the silver, computed at its coining rate in standard dollars, which is the accounting rate at the mints, deposited, purchased and parted at the mints and assay offices of the United States, during the last fiscal year, amounted to \$37,917,026.36 (32,584,944.61 standard ounces). Of this amount the sum of \$2,422,843.12 consisted of fine and unparted bars of the several institutions redeposited, leaving the net value of the silver deposit-

CONCENTRATING PLANT WITH ROLLS, JIGS AND DUNCAN CONCENTRATORS.

to be desired when anything like favorable conditions exist. The MINING AND SCIENTIFIC PRESS recognized years ago the fact that it was only a question of time when it would be necessary to put up ore-dressing works, which would concentrate the custom ores for miners. We repeatedly urged the matter in our columns. The great difficulty was, however, to do this sufficiently cheap. And, moreover, our people did not seem to take kindly to concentrating at first, as it looked to many as a needless handling of the ore, they preferring to work it direct, without reducing the bulk of the gangue.

Now these concentrating mills are springing up in many directions, and their utility and economy are recognized. This is specially the case where the ores have to be shipped to any great distance for reduction.

The illustration we give on this page represents a modern concentrating mill of from 30 to 50 tons of lead or copper ore per day. The ore passes over grizzlies and through the ore-crusher as in the ordinary quartz mill. After passing through the crusher it is conducted into a large set of high-speed crushing rolls, which reduce it to about the fineness of grains of wheat. It is then elevated to the top of the building by means of a belt elevator and conducted into the sizing screens. That portion which passes through the first screen (about 20 mesh) is conducted into the remaining screens, where it is sized and thence conducted to the jigs. That portion which does not pass through the first screen is conducted to a small set of

lowering the superintendent to ascertain the extent of a cave which threatened to swallow up the pump engine. At a depth of little more than 100 feet below the surface was discovered a cave large enough to engulf a block of five-story buildings. In order to save the pump engine from being drawn into the chasm it was necessary to disconnect the pump-rod. Superintendent Sharon officially authorizes the statement that there is no present intention to drain the lower levels of the mines.

THE Albuquerque Journal says: "The copper industry of Arizona will be shortly opened up, and an impetus given to the mining industries of that Territory that will give employment to hundreds of people. A syndicate of three St. Louis capitalists have subscribed \$400,000 as a working capital, and will keep the property in their own hands, as they think they have one of the best plants on the Pacific Slope."

WORK at the Hillis & King coal mine on Mark West creek, Sonoma county, is progressing rapidly. The main or new tunnel is now in about 75 feet, and will have to be extended about 25 feet further before the ledge is struck. It is anticipated that the quality of coal will be far superior to that taken from the surface.

ARIZONA'S bullion output during 1886 is the smallest for the past five years. Her beef output is the greatest and the agricultural outlook has never been better.

To fit this building for instruction in carpentry, with the proper tools and benches, will cost about \$2000. To fit it for the proper working in metal, including tools, will cost about \$5000. To fit it for instruction in blacksmithing and forging will cost about \$400. With furniture, shelves, cases, etc., the total cost will be \$11,300. It will accommodate from 30 to 40 students at a time. If this plan is carried out, all the engineering colleges of the University will become even more important to the State than they now are.

In speaking of this subject, in his report to the Governor on behalf of the Regents, President Holden says:

"It appears to be obvious that a graduate from an engineering college should have had some experience in handling all the tools—both hand and machine tools—that are used in ordinary work, and also in forging and molding. Such knowledge is necessary in nearly every position to which a mechanical or other engineer may be called in practical life. No student in mechanical engineering can become a good draughtsman or designer of machines without knowledge of this sort. The conclusion appears to be obvious that shop-work should be required from every graduate in the college of mechanical engineering, and I presume at least in the freshman year from all scientific students. It is impossible to teach a student in these colleges anything more than the elements of such work; but the principles which govern all mechanical operations can be

ed, purchased and parted, \$35,494,183.24 (30,502,817.78 standard ounces), against \$36,789,774.92 of the preceding fiscal year, being a falling off of 1,113,399.13 standard ounces of the value of \$1,295,591.68.

Of the net value of the silver deposited for bars, parted from gold and purchased for coinage during the year, namely, \$35,494,183.24, the sum of \$32,454,644.50 was classified as of domestic production, \$1,480,425.43 of foreign bullion, \$279,292.39 U. S. coins melted, \$812,664.50 of foreign coins, and the remainder, \$467,156.63, of old jewelry, plate, etc.

The silver coinage during the year consisted of \$29,838,905 in silver dollars, \$3,052.50 in half-dollars, \$3,626.25 in quarter-dollars, and \$176,764.20 in dimes. The total silver coinage amounted to 31,627,157 pieces, of the value of \$30,022,347.95, against 31,699,096 pieces, of the value of \$28,848,959.65, in the preceding fiscal year. The silver coinage was executed principally at the mints at Philadelphia and New Orleans.

In the local market for metals there is nothing new to report. Quicksilver is quiet and unchanged. Tin is nominal and out of season. Coal is steady and the amount on the way from foreign ports to arrive in the near future is not excessive. The late improvement in the ocean freight market, however, had a tendency to increase forward supplies from Europe.

A PROJECT is on foot for the establishment of a mining stock exchange at Portland.

## Liquid Fuel.

## Details of Trials on San Francisco Bay.

For two or three years past some very interesting trials of the use of oil for fuel, instead of coal, have been conducted by the Central Pacific Railroad Company on the freight and passenger ferry steamers on San Francisco Bay. When, therefore, a short time since, the use of this liquid fuel was abandoned by the company, and the furnaces of the boilers again altered to burn coal, it was concluded that oil-burning was a failure. It was thought strange, too, because it was understood that the oil was the more economical fuel, doing away as it did with the numerous firemen on the steamers, since the oil was fed to the furnaces by an automatic arrangement. A number of reasons were given by the general public for this abandonment of oil as fuel, among them that the supply was insufficient; that it cost too much, and finally, that it burned the furnaces and boilers out so badly that it cost more than it came to finally.

As the matter is of considerable general, as well as local importance, we have obtained some information on the subject, which, being mainly official, will be read with interest.

In the first place, as to the character of the liquid fuel itself. It is not a crude petroleum, as many suppose. It is a residue or refuse. The Pacific Coast Oil Co. before selling this material, remove the lighter oils, which enables them to sell the refuse at low cost. The first product removed is a gasoline of 84° specific gravity; the second is naphtha of 74° specific gravity; the third is benzine of 63° specific gravity; the fourth is what is known as water-white illuminating oil of 48° specific gravity. Then they remove the standard white illuminating oil of 44° specific gravity. This leaves a refuse of about 26° specific gravity, which is the fuel oil used on the steamers.

## The Steamer's Records.

The liquid fuel was used on three of the largest steamers of the company, the Thoroughfare, Piedmont and Solano—the latter the largest ferry steamer in the world. The records of the runs and results of work on these steamers we obtain from the office of the Auditor of the Motive Power and Machinery Department of the railroad company.

The first steamer to consider is the Thoroughfare, which runs from Oakland creek to the depots at the southern end of this city, carrying freight trains across the bay.

STEAMER THOROUGHFARE, DEC., 1883, TO DEC., 1884, WITH COAL.	
6169 tons Lone coal at \$3.96.....	\$25,017 20
62 tons Carbon Hill at \$5.50.....	506 00
	\$25,523 20
Pay of firemen.....	3,049 61
Total cost of fuel and firemen.....	\$29,572 81
Miles run.....	22,662
Cost per mile in cents—fuel.....	115.27
Cost per mile in cents—firemen.....	13.46
Total cost.....	128.73

STEAMER THOROUGHFARE, JAN., 1885, TO AUG., 1886, WITH OIL.	
2,135 barrels of oil at \$1.65.....	\$3,523 16
11,519 barrels of oil at \$1.70.....	19,582 72
	\$23,105 88
Pay of firemen.....	2,227 35
Total cost of fuel and firemen.....	\$25,333 23
Miles run.....	40,800
Cost per mile in cents—fuel.....	55.63
Cost per mile in cents—firemen.....	5.46
Total cost.....	62.09

The above shows 66 64-100 cents per mile in favor of oil, or 51 77-100 per cent. In this statement it is shown that 58.14 gallons of oil equal one ton of coal.

The Piedmont, a large steamer, is in the ferry traffic between Oakland mole and San Francisco. She was originally devised for coal, but was afterward fitted for oil (as were the other steamers).

PIEDMONT, NOV., 1884, TO AUG., 1885, WITH COAL.	
4929 tons Carbon Hill coal at \$5.00.....	\$24,646 25
1385 tons Carbon Hill coal at \$5.50.....	7,067 50
	\$31,713 75
Pay of firemen.....	7,658 04
Total cost of fuel and firemen.....	\$39,371 79
Miles run.....	43,525
Cost per mile in cents—fuel.....	72.86
Cost per mile in cents—firemen.....	17.59
Total cost.....	90.45

STEAMER PIEDMONT, SEPT., 1885, TO AUG., 1886, WITH OIL.	
4,136 barrels oil at \$1.65.....	\$6,829 35
15,955 barrels oil at 1.75.....	27,174 50
	\$34,003 85
Pay of firemen.....	4,541 76
Total cost of fuel and firemen.....	\$38,545 61
Miles run.....	44,307
Cost per mile in cents—fuel.....	76.74
Cost per mile in cents—firemen.....	10.25
Total cost.....	86.99

The above shows 3 46-100 cents per mile in favor of oil, or 3 8-10 per cent. In this case it took 133.63 gallons of oil to equal one ton of coal.

The Solano is the immense steamer which takes the overland trains, freight and passenger, across Carquinez straits, between Benicia and Port Costa. The run is very short.

STEAMER SOLANO, DEC., 1883, TO FEB., 1885, WITH COAL.	
1027 tons Carbon Hill coal at \$5.00.....	\$5,137 50
2690 tons Carbon Hill coal at \$5.50.....	12,047 75
5724 tons Empire coal at \$3.79.....	21,694 91
	\$38,880 16
Pay of firemen.....	8,476 70
Total cost of fuel and firemen.....	\$47,356 86
Miles run.....	7,504
Cost per mile in cents—fuel.....	518.12
Cost per mile in cents—firemen.....	112.96
Total cost.....	631.08

STEAMER SOLANO, MARCH, 1885, TO AUG., 1886, WITH OIL.	
2,395 barrels oil at \$1.65.....	\$3,952 16
16,909 barrels oil at \$1.70.....	28,745 30
	\$32,697 46
Pay of firemen.....	8,496 84
Total cost of fuel and firemen.....	\$41,194 30
Miles run.....	7,308
Cost per mile in cents—fuel.....	447.42
Cost per mile in cents—firemen.....	116.26
Total cost.....	563.68

The above shows 68 40-100 cents per mile in favor of oil, or 10 68-100 per cent. This gives the result of 94.16 gallons of oil equal to one ton of coal.

Last month the Pacific Coast Steamship Company, desiring to get some idea of details of cost of use of oil, with a view to adopting it on their steamers if possible, had Mr. John Bermingham examine the matter for them. He wrote the following letter to Edwin Goodall, secretary of the company:

Edwin Goodall, Esq.—DEAR SIR: I have examined the condensed results of the relative values of coal and oil on the Solano, Thoroughfare and Piedmont. There is great apparent saving in favor of the oil fuel on the two first-named steamers and a slight apparent saving of 3 3-10 per cent in favor of oil fuel on the Piedmont. I have no means of knowing whether the price charged for Carbon Hill coal is excessive as compared with other well-known fuels consumed here, or to the reverse. But there is one very important element that has not been taken into account by the railroad company's statistician, and that is, the relative speed developed by the Piedmont while using the different fuels above mentioned. In journeying across the bay on that vessel I have been informed by her officers that the trips were made with coal in from 17½ to 18 minutes, while with oil 19½ to 20 minutes were consumed. If that be true the difference in speed in favor of the coal would be almost one mile per hour, which means 25 per cent, as it requires that percentage to increase the speed of a vessel one mile per hour ("eight times the power to double the speed"), so if the speed obtained by the use of the oil could have been brought up to that obtained by the coal, 25 per cent more oil would have been consumed; or, vice versa, if the coal speed had been brought down to the oil speed, 25 per cent less coal would have been consumed.

It requires from eight to 12 per cent of the water evaporated by oil fuel to perfect its combustion. The railroad statistician does not appear to have taken the cost of that water into account.

The Piedmont had to keep her oil fuel burning all the time between trips in order to "bottle up" steam to give her a spurt across the bay. I know nothing of the relative speeds with oil and coal in use on board the Solano and Thoroughfare, where the oil appears to be the most economical.

Your oil steamers might possibly use that fuel with diminished speed, but you would have to make provision for three tons of fresh water per day for its consumption.

J. BERMINGHAM.

A copy of the above letter was forwarded to Master Mechanic Stevens, of the Southern Pacific Co., who brings out further facts in connection with the subject in his answer, which is as follows:

SACRAMENTO, Dec. 3, 1886.

Geo. Loomis, Esq., President Pacific Coast Oil Co.—DEAR SIR: I am in receipt of your favor of the 22d ult, inclosing copy of a letter written by Mr. J. Bermingham to Edwin Goodall, Esq., in regard to oil fuel burned on the steamer Piedmont.

Mr. Bermingham figures in this instance altogether from theory. At the outset he says: "There is a great apparent saving in favor of the oil fuel on the two first named steamers, and a slight apparent saving of the three and three-tenths per cent in favor of the oil fuel on the Piedmont."

So far he is correct; but he does not take into consideration the saving effected on board the steamer Piedmont by the use of oil fuel in the reduction of firemen—an item amounting to about \$14 per day. Neither does he consider the \$6 per day which it costs to place the coal on board the boat—the oil was handled by the deck hands at no extra expense whatever.

Further on Mr. Bermingham states: "There is one very important element that has not

been taken into account, and that is, the relative speed developed by the Piedmont while using the different fuels above mentioned."

The element of speed was duly considered; and, permit me to say, there was no such difference as the gentleman mentions—coal 17½ to 18 minutes and oil 19 to 20 minutes. True, the time of crossing of the Piedmont was somewhat less with coal than with oil, but not to exceed half a minute less per trip run on an average. In the case of the Solano the speed was always equal to and usually greater with oil than with coal, and the steam could be increased while under way to any pressure desired.

In making this comparison there is another important factor which Mr. Bermingham and others who have manifested so much interest in the matter seem to have entirely overlooked: that is, the construction of the Piedmont boilers. These boilers were constructed specially for burning coal; they are flue boilers and not adapted for oil fuel; while with the steamers Solano and Thoroughfare the case is materially different; the boilers of the latter boats are of good design or pattern for burning oil fuel.

Mr. Bermingham further says: "It requires from 8 to 12 per cent of the water evaporated by oil to perfect the combustion. The railroad statistician does not appear to have taken the cost of that water into account."

Our records show nothing of the kind. They show, however, that the consumption of water with coal and oil was the same per trip run. True enough, it took some steam to perfect combustion, but it was hardly appreciable, though, of course, it amounted to something.

Referring again to the steamers Solano and Thoroughfare, I will say that the saving effected by those steamers by the use of oil was considerable (I believe you have the reports showing just what it was), and if the saving by the use of oil was so great on those boats why should it not be just as great on the Piedmont? The reason, the true reason, and the only reason, lies in the difference in the design of the boilers, I will state further that during the time the different boats were burning oil, we were not called upon to make repairs to the boilers; while with burning coal there is not a week when more or less repairs are not necessary.

I will add, taking Mr. Bermingham's statement, that "12 per cent of the water evaporated was required to perfect combustion." Assuming this to be the case, 12 per cent of the water actually evaporated during the test of oil for six days is 19,968 gallons. Our records of the test show the same number of gallons evaporated in both cases.

Yours truly,

A. J. STEVENS,  
General Master Mechanic.

From these statements it will be seen that the oil fuel was the most economical, notwithstanding it has been given up by the company. The only explanation of this is in the surmise that as the company owns an extensive coal mine, coal steamers, etc., they can afford to use coal when others cannot.

## Mining Accidents.

Thomas Griffith, an old pioneer and miner of Amador county, through a mistake in the signal bell was run into the sump of the Pacific shaft, at Plymouth, on Friday of last week, and died from his injuries.

Silas Daws was badly hurt in the Idaho mine at Grass Valley last week. He was working in the 1600-foot level and a large piece of hanging wall struck him in the face, breaking his lower jaw and cutting his upper lip horribly, loosening the flesh from the bone to the eyes. He also sustained a compound fracture of the right arm. Isaac Martin, a brother-in-law to Daws, was recently killed in the mines in Montana, leaving Daws the support of his widowed sister.

At the Willietta mine, near Jacksonville, last week, says the Tuolumne Independent, Foreman S. D. Wagoner had a narrow escape from instant death. Himself and C. Keith had charged two holes with a stick of Giant powder each, and ignited the short fuses. Keith's charge exploded, but the other did not, and Mr. Wagoner supposed he had not lighted his fuse. He proceeded to investigate, and when within four feet the charge blew out—being tamped with sand—without blowing the rock. It was a close call, but did no serious damage beyond the shock and a scare. Mr. W. has probably used over \$1000 worth of Giant powder and never had an accident before; but familiarity with danger will cause even the most cautious to become careless.

THE mines on the ridge west of us, and around Gold Lake, are looming up each week as they are being developed. Next spring will, from present appearances, show up a few very rich ledges, and business will be lively around the mines. A quartz mill will be built at the Mountain King, and the Gold Valley Company will also put in a quartz mill. The new saw-mill will supply the lumber. Timber and water are plentiful.—Sierra Valley Leader.

## Christmas.

The annual recurrence of this day has been made a season of festivity in all civilized lands, and nowhere has it received a more joyful welcome than among English-speaking people. It comes in with the merry chime of bells and a burst of all sorts of musical instruments. For many generations it was the custom on Christmas eve to light large wax candles, roll into the fireplace a huge back log, and trim the houses with various kinds of evergreens. The Druidic tradition, that whatever grew upon the oak trees was a gift from heaven, made the mistletoe a universal favorite. It was a season when conventional civility was laid aside, the staid old proprieties locked up in a closet, and full rein given to the "Lord of Misrule" and the mirth-making Merry Andrew. In the palace and hovel, down in the earth where sooty miners delved, and far out to sea where ships tossed on the waves, Christmas came in with shouts, songs, and an infinite variety of fun and jollity. Every one put on his best clothes and for the nonce threw work and dull care away. It was the season of mighty feasting and family gatherings. Among our English ancestors the festival began by bringing in with frolicsome ceremony the favorite dish—the soused boar's head with an apple in its mouth and trimmed with rosemary; and how the table was heaped with turkey, game, big joints of beef and haunches of venison flanked with mince pies, plum pudding, has long been familiar to the reader of Dickens' gustatory traditions. The sight of such a table now would make a modern dyspeptic turn pale, and scare a good theosophist into a conniption fit, and fill a Buddhist with holy horror at the cannibalism that feasted upon its ancestors.

The age of the mighty eating Christmas has passed. While the spirit of kindness, goodwill and gift-making still attends and adorns it, the immense joints of beef, haunches of venison, monstrous wreaths of sausages, head-cheese and pot-pies which delighted the senses of a former generation, would now, instead of stimulating the appetite and making the mouth water, sicken and disgust. Hygiene, chemistry, and the fashion for French cooking have come in, and the fondness for "little dishes," that fascinating branch of the culinary art that Miss Corson has written so much about, has quite banished the lusty indulgences of the table. Gluttony has gone off to keep company with drunkenness and other deadly sins.

Even festive reunions have felt the withering breath of change. They are not so common, so generally observed, so anxiously expected, as in former times. When the sons and daughters and relatives were grouped in the same neighborhood, the sense of kinship was kept warm and ebullient by frequent visits and interchanges, and Christmas became the greatest day of the year, when all the clans gathered under one roof-tree. But our modern ways of steam traveling have so widely scattered families that this has become impracticable. And what is still more painful, the wide dispersion tends to weaken the ties of relationship. Brothers and sisters become as strangers. Already the patriarchal homestead, with its rosy memories, and the family burying ground, with its sad, sweet associations, have gone away and become memory and tradition.

But what if the Christmas dinner is not made so much of, and roast turkey and cranberry sauce, buckwheat cakes and honey are not so intimately associated with happiness and a good time! The Christmas trees are more abundant and more heavily laden with their peculiar fruit. What if the gambols and carols have ceased, and the mirth is less boisterous! The art of giving has become more delicate and expressive of good taste, love and friendship. What if our family gatherings are not so large! The spirit of mercy, goodwill and charitableness was never so expansive and odorous. There is every indication of a wholesome growth of the home sentiment and a development of the spirit that gave the day its meaning the world over. The spirit of the choir of angels who serenaded humanity the morning of the Advent singing "Glory to God in the highest, and on earth peace and goodwill toward men."

A FLOOD OF IMMIGRANTS.—Mr. Welch, southwestern passenger agent of the Missouri Pacific, reports that during the past 30 days more than 8000 people have arrived in Southern California from the East.

## JAMES' PATENT RECIPROCATING STAMP MILL.

(PATENTED AUG. 16, 1881.)

Weight of Boss and Shoes (1200 pounds) acts on each Shoe separately. It is practically the same as the regular Stamp Mill.

Capacity, 6 Tons in 24 Hours. 4 H. P.

Parties wishing to test the Mill with any ore they may bring, will find one in operation at our works in this city.

**PRICES:**

Reciprocating Stamp Mill, \$350 00

Rock Breaker, - - - 100 00

Automatic Ore Feeder, - 50 00

Single Track Ore Car, - - 40 00

SEND FOR CIRCULAR.

**TATUM & BOWEN,**

34 & 36 Fremont St., San Francisco.

91 & 93 Front St., Portland, Oregon.

## Narrowing the Area for Prospecting.

It is unfortunate that the distinction between mineral and agricultural lands is not more sharply drawn in the mining regions of this coast. It is true that testimony is generally taken as to the character of the land when it is in a mineral region, but the burden of proof generally rests on the miners who may have no interest in the matter whatever. Certain witnesses are brought forward by the agricultural claimant, who testify that in their opinion the land is worth more for agriculture than for mining. As these men generally know nothing of mines or minerals, and are most frequently agriculturists, they can easily testify to this with clear consciences. If any one objects, he must prove that the land does contain minerals. In most cases no one has a personal interest in objecting, and, while he may be pretty certain that the land is mineral, he may not be able to prove it, and the agriculturist gets his patent, no one opposing. It is only when people have mining interests in the land in question that opposition is made.

The consequence of this is that small ranches are being taken up in all directions in little valleys, plots and sections in the mining regions. And once the agriculturist has his patent the miner must stand off. The result is that the regions for prospecting are gradually but surely being reduced in this State. Let a prospector go near one of these plots taken up for farming purposes and he is warned off by the proprietor. Even if it is proven that there is a ledge on the property after the patent is given, and the legal publication and posting have been done, there is no redress.

It is not to be implied that the miners have the slightest objection to agriculturists taking up purely agricultural land wherever they find it. But they do object to their getting hold of tracts in purely mineral regions, only partly prospected, since it narrows the prospector's chances in localities designed by the Government for his special use. Agricultural land is much more abundant than mineral in every State and Territory. There is complaint from many sections, notably Amador and neighboring counties, of the practice of patenting for agricultural land, sections which are known to be mineral in their character, but which are patented as agricultural because no one has any personal interest in combating its alleged agricultural character.

## Discussing a Patent Bill.

A bill has been introduced in Congress limiting the jurisdiction of the United States Courts in patent cases, and to protect persons who, without notice, are bona fide manufacturers, purchasers, vendors and users of patent articles. The bill limits the jurisdiction of the United States Courts in patent cases wherever the amount in controversy exceeds \$200 against one person or citizen.

One of the sections provides that the purchasers of any patent right for actual use shall not be liable to damages, royalty or for the value of the same, or for infringing the same in any manner, who at the date of such purchase had no knowledge of the claims of any third person, or that the inventor of the same has an interest therein adverse to the seller thereof; that no person who shall in good faith purchase, use, manufacture or sell without previous knowledge of the existence of the patent therefor any article, machine, machinery or other thing for the exclusive use, sale or manufacture of which any patent has been or hereafter may be granted (to any person, persons or corporation whatever, shall not be liable in damages or otherwise for an infringement of such patent until after written notice of the existence thereof shall have been personally served on such person or persons or corporation.

Townsend, of Illinois, who, on behalf of the Patent Committee, tried to have the rules suspended and pass this bill, states that the only purpose of the measure is to protect innocent purchasers against blackmail.

Hammond, of Georgia, opposes the bill and declares that the first section would strike down seven-eighths of all the patents in the country, while the second section would place a premium upon scoundrelism.

Butterworth, of Ohio, regarded the bill as a bold attempt to kill the goose that laid the golden egg.

Townsend saw in the opposition to the bill a renewal of the old struggle between monopoly and anti-monopoly. In order to prevent a vote being taken on the bill, Mills, of Texas, moved to adjourn, and the House acquiesced.

## Fresno County Mines.

## Hildreth Notes.

A correspondent of the Fresno *Expositor*, writing from Hildreth, says:

The continual monthly bullion shipments from the Abby mine and increasing ore reduction by the numerous arastras in this section are commencing to open the eyes of the unsophisticated Missourian of the valleys of Fresno county, as well as the mining population of other counties, judging from the "phiz" of the new-comers that arrive by the Fresno and Madera stage lines. This district is being more closely watched by mining capitalists than any other section in the State, for the simple reason that heretofore continuous quartz ledges were not supposed by theorists and mineralogists to exist, but such principles are of late being put aside, and mining men have come to the conclusion that "gold is wherever it is found." Since gold was discovered in the sandstone formation running through the book cliffs of South-eastern Utah, and veins of quartz containing chloride of gold incased in walls of asbestos have been found in the Sierra La Selle range of mountains in Southwestern Colorado, the prospector and miner use their own judgment in preference to the theories announced by experts on geology.

Such is the case in this section; more so on account of the various formations through this mineral belt, which is twenty miles in width, bearing north forty degrees east, extending through our northern county and ending south of us in the majestically appearing table mountains on the east side of the San Joaquin river.

The developments now going on, and the prospects in view of the sale of the James & Francis and Wilson mines to outside companies, are going to make this district one of the largest gold-producing mining camps on the coast. At present the monthly shipments of precious metal do not exceed over \$100,000 in this and adjoining camps, but these figures are considered large for the amount of money invested in machinery and development. And, again, one can say conscientiously that the gold is here, and lots of it, but more capital is needed to bring it to the surface. One hundred and five thousand dollars has already been invested in this district for machinery, and if locators would sell their prospects at reasonable prices, according to the judgment of San Francisco mining men, three times that amount would be invested. But, like in all camps, on the strength of one or two producing mines, prospectors have an idea that their claims are all mines.

For the benefit of inquiring miners who are not informed on the state of affairs in regard to employment, let me say that at present the working companies are not in need of miners, as plenty can be had from the number around town. The going rate of wages is \$2.75 per day, or \$2 and board at the companies' eating houses. The mines are wet, but not to that extent that miners' candlesticks cannot be used to advantage.

The McNally mine is working on a five-foot vein of ore at the 600-foot level, and the ore mills \$45 per ton. The sulphurets average \$270 per ton. Winzes are being sunk on the 600-foot level to connect with stopes on the 600-foot level. The owners are also pushing their drifts on the lower levels.

The Hanover mine has been started up. It is owned by S. H. Williams, of Madera. The ore averages \$35 free gold per ton; sulphurets, \$150 per ton.

James & Francis still continue to hoist rich ore from their ledge. The ore mills from \$200 to \$300 per ton, wire gold, and the sulphurets are very good. Their property contains the richest continuous body of ore in the county.

Harry Clark and Barney have struck a rich thing by sinking upon their ledge. The incline shaft is down 45 feet on a ledge of quartz two feet wide, which is accompanied by clay selvages that prospect rich. The foot and hanging walls are granite.

Winter has commenced, if one would judge from the amount of rain that is falling and from the lofty table mountain to the East. The Sierras are covered with snow, which promises to last until spring.

Prospectors are flocking to their winter placer claims to sluice out the precious metal from the bedrock of the numerous gulches of this district. The placer ground in this vicinity prospects, on an average, 12 cents to the pan (or 20 pounds of dirt) of gold that is worth \$15.65 per ounce. It is no easy matter to obtain the approximate amount of gold dust that is being washed out and gathered on account of the number that follow placer mining as a business. Some is sent away by the store and hotel-keepers, while a certain portion leaves by express.

H. Lee and R. Bywerns have discovered a very rich vein of quartz that will assay into the hundreds. Work will be commenced immediately to sink upon the vein by an incline shaft. This property lays in the primitive formation, being composed of talc, porphyry and decomposed quartz, without walls, and most likely will extend down 80 or 100 feet before a change into syenite and granite formation.

The casing of the vein prospects \$18 per ton. It is known as the Oakland quartz claim, and is an extension of the Fresno mine, owned by Hitchcock, Keith and Byrd.

The Fresno mine is still improving as the ledge is developed. The boys in this locality intend to survey out a town site and elect

Superintendent Thomas Keith as Mayor of the town of Keithville. Byrd will do the welding of tires in the shop, according to Bob Bywerns' directions. As soon as Hitchcock sends over Stump a double shift will be put on.

Joseph Pfeiffer, one of the owners of the McNally mine, has arrived from San Francisco, and is much pleased at the improvement in the White Rock mine. Work will soon be started on the company's Stockton mine, which is thought to be equally as good as the McNally mine.

The McNally ledge is looking fine, and the ore continues to pile up the amalgam in the batteries. The ore from the 600-foot drifts is increasing in value in sulphurets.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING DECEMBER 14, 1886.

- 354,298.—STOOL AND SEAT—Ivy Baldwin, S. F.  
354,398.—SHEEP SHEARS—Bills & Hamilton, Oroville, Cal.  
354,391.—RUBBER-DAM CLAMP—O. Carpenter, Oakland, Cal.  
354,318.—RAILWAY TRICYCLE—Wm. Hayes, Los Angeles, Cal.  
354,420.—GRAFTING TOOL—C. W. Hoit, Sacto.  
354,421.—HARVESTER—Dan'l Houser, Stockton, Cal.  
354,513.—CLOD CRUSHER AND SEEDER—David Lubin, Sacto.  
354,481.—SAFETY SNAP HOOK—I. M. McKay, Rocklin, Cal.  
354,345.—NEUTRALIZING FUMES OF EXPLOSIVES—Thos. Price, S. F.  
354,355.—COMBINED RAKE AND HOE—J. S. Seatter, Visalia, Cal.  
354,363.—FRUIT-GATHERING SHEARS—L. H. Titus, Los Angeles, Cal.  
354,282.—VEHICLE BRAKE—H. Welisch, Cochise Co., A. T.  
R. 10,790.—ANATOMICAL CHART—J. T. White, S. F.  
13,863.—TRADEMARK—W. T. Coleman & Co., S. F.  
354,368.—FEED-WATER HEATER—H. Wilson, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

In addition to the notices of recent patents printed on page 406, we give the following:

GRAFTING TOOL.—Chas. W. Hoit, Sacramento. No. 354,420. Dated Dec. 14, 1886. This invention relates to a grafting tool or device for cutting a kerf or notch in the limb or stick and to a corresponding formation of the end of the slip which is to be grafted upon it.

HARVESTER.—Daniel Houser, Stockton. No. 354,421. Dated Dec. 14, 1886. This improvement in harvesting machinery is of that class in which the header or mechanism for cutting the grain is connected with a thrashing, separating and cleaning mechanism so that it may be cut, transferred from the header to the thrasher, separated and cleaned at one operation, and while the machine is hauled about the field. The patent covers several improvements in construction and operation.

SHEEP-SHEARS.—Robt. M. Bills and Albert S. Hamilton, Oroville, Butte Co. No. 354,378. Dated Dec. 14, 1886. This patent covers the following claim: "In sheep shears, the blades, having extensions or shanks fitting in similarly shaped hollow handles, in combination with the adjusting screws adapted to press upon opposite edges of the flat sides of the shank, whereby the shanks and blades may be turned so as to present the edges of the blades to each other at any desired angle." By this construction the blades can be set to cut to the best advantage without either crossing or slipping upon each other without cutting.

RUBBER-DAM CLAMP.—Oliver Carpenter, Oakland. No. 354,391. Dated Dec. 14, 1886. This invention relates to operative dentistry, and particularly to the class of clamps which are used for holding rubber dams in place around the tooth. It consists in a novel jointed frame, carrying in its ends the separate and removable jaws, and a set-screw, by which the jaws are made to clamp tightly on the tooth. The object of the invention is to provide a simple and effective rubber-dam clamp which may be applied by reason of its separate removable jaws, to any of the 10 anterior teeth in each jaw for the purpose of holding the rubber dam back from the labio-cervical cavities in said teeth while filling such cavities, or which may be applied in other suitable positions.

CLOD CRUSHER, PULVERIZER AND SEEDER.—David Lubin, Sacramento. No. 354,513. Dated Dec. 14, 1886. The apparatus is for crushing and pulverizing clods or lumps of earth and simultaneously seeding the ground and covering the seed, the whole being completed at a single operation. It consists of roller or series of disks mounted upon a shaft so as to rotate independently, or, when desired, keyed fast to the axle, provided with radial arm or fingers,

a series of lifting-fingers projecting forward between the toothed disks so as to raise the lumps or clods and bring them into position to be broken between the teeth and fingers as the disks rotate, and in connection therewith of a seeder of any suitable or desired construction which seed the ground, and a device by which the seed thus deposited may be covered.

FRUIT-GATHERING SHEARS.—Luther H. Titus, Los Angeles. No. 355,363. Dated Dec. 14, 1886. This device is specially intended for gathering such fruit as would be injured by falling, or by rough or careless handling. It consists of shears or a cutter mounted upon a frame with a spring by which the blades may be opened or separated, and a lever by which they may be operated to close and cut, the frame being fitted to the hand in such a manner that it can be worn upon one hand and bring the cutter-blades in such a position that when the fruit is grasped in the hand the shears will be in position to sever the stem, leaving the fruit in the hand, ready to be deposited in the proper receptacle. This device is specially useful because all the work of holding and cutting the fruit may be done with one hand, and the operator, standing upon a step-ladder within reach of the fruit, can reach to the extent of the arm on either side, gathering all the fruit within reach, while steadying himself with the other hand.

FEED-WATER HEATER.—Harry Wilson, Philadelphia, Penn. No. 354,368. Dated Dec. 14, 1886. This water-heater for steam boilers is intended especially for those upon steamers where superheated steam is used. It consists essentially in a suitable feed-water heater, connected directly with the steam drum of the boiler, whereby it may receive live steam, by which the water is raised to a much higher temperature than could be obtained with exhaust steam. It consists particularly in the cylinder, its heads, tube-sheets and tubes, its air pipes and controlling valves, and its drain and controlling cock and indicator, together with certain details of construction. Feed-water heaters have heretofore been supplied with exhaust steam. This steam does not raise the temperature of the water sufficiently, and its use is frequently inconvenient and sometimes impossible, as when the engine is stopped. The main object of this invention is to supply the feed-water heater with live steam, whereby the water is heated more effectively, and to this end Mr. Wilson makes a heater which can be directly connected with the steam drum of the boiler and can be so adjusted and regulated that objections to such a source of heat are avoided.

## Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, to those who pay fully one year in advance of date, if requested, the following articles (while this notice continues) at the very greatly reduced figures named at the right:

- 2.—World's Encyclopedia, 794 pages, 1200 illustrations (exceedingly valuable).....\$0.50
- 3.—Dewey's Patent Elastic Binder (cloth cover), name of this paper stamped in gilt.....50
- 4.—To New Subscribers, 12 select back Nos. of this paper.....Free
- 7.—Any of Harper's, Frank Leslie's and most other first-class U. S. periodicals, 15 per ct. off regular rates.
- 9.—Pacific Coast and Eastern Dailies, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent off advertised retail rates.
- 10.—Picturesque Arizona, 380 pages, in cloth and gilt.....25
- 11.—Californian, 100 pages, Magazine, 1880 to 1882 (3 Vols.) single Nos.....03
- Per volume, unbound, 5 Vols.....20
- Per volume, bound, cloth back and stiff paper sides, about 600 pages. (Send two-cent stamp for sample).....40
- 14.—Dewey's Pat. Newspaper Fileholder (18 to 36 in.).....25
- 15.—Life among the Apaches, 322 pages, stiff cloth.....25
- 17.—Architecture Simplified, 60 pages.....15
- Webster's Dictionary, 634 pages, with 1600 illustrations; very handy and reliable.....50
- De Groot's History of Mining in California, 16 pages.....05
- Beautiful Poetic Review, entertaining and instructive, 35 pages (a handsome and pleasing present).....25

NOTE.—The cash must accompany all orders. Address this office, No. 252 Market St., S. F. Send for any further information desired. Inform your neighbors about our offers and paper. Sample copies of this paper mailed free to person thought likely to subscribe.

## Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, \$3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,  
252 Market Street, San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.  
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.  
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Vulcan Nos. 1, 2 and 3,  
The Best NITRO-GLYCERINE POWDERS Manufactured.  
SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.  
Caps and Fuse of all Grades at Bottom Rates.  
VULCAN POWDER CO.  
218 California Street, San Francisco, Cal.

## THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,  
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE, which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO, CAL.

## THOMAS PRICE'S ASSAY OFFICE, CHEMICAL LABORATORY,

BULLION ROOMS and ORE FLOORS,  
524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

## Metallurgy and Ores.

**SELBY  
SMELTING and LEAD CO.,**  
416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY  
And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

...MANUFACTURERS OF...

BLUESTONE,  
LEAD PIPE,  
SHEET LEAD,  
SHOT, Etc., Etc.

ALSO MANUFACTURERS OF

Standard Shot-Gun Cartridges,  
Under Chamberlin Patent.

## JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE  
AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG  
GISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

## Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,  
Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1869

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications furnished for the most suitable Process for Working Ores.

Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,

(Formerly Huhn & Luckhardt, )

Mining Engineers and Metallurgists.

J. KUSTEL. H. KUSTEL.  
★ **METALLURGICAL WORKS,**  
318 Pine St. (Basement,  
Corner of Leidesdorff Street, - SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my Process.  
Assaying and Analysis of Ores, Minerals and Waters.  
Mines Examined and Reported on.  
Practical Instruction given Treating Ores by improved processes.

G. KUSTEL & CO.,

Mining Engineers and Metallurgists.

C. H. AARON,  
ASSAYER AND METALLURGIST,  
NOGALES, ARIZONA,  
Will attend to business in connection with mines in Sonora or Arizona.

WM. D. JOHNSTON,  
ASSAYER AND ANALYTICAL CHEMIST.  
514 Kearny Street,  
SAN FRANCISCO, - CALIFORNIA  
ASSAYING TAUGHT.

Personal attention insures Complete Returns.

**SPENCERIAN  
STEEL PENS**  
Are The Best  
Established 1860.  
USED BY THE BEST PENMEN  
Noted for Superiority of Metal,  
Uniformity, and Durability.  
20 Samples for trial, post-paid, 10 Cents.  
IVISON, BLAKEMAN, TAYLOR, & CO.,  
753 and 755 Broadway, New York.

## Mining Share Market.

The prices of stocks are by no means as high as they were during the wild excitement of a few weeks back, though they are still pretty firm. The falling off in prices has not, of course, affected the mines themselves. In fact many of the old Comstock claims are being reopened and developments extended. Among the long idle ones being reworked are the Baltimore, Bullion, Iowa, Quinn, Alpha, Exchequer, Overman and others mentioned in our mining summary. The *Enterprise*, in speaking of the situation on the Comstock, says: All sorts of rumors, probable and improbable, continue to prevail as usual. The last day or two rumors of improvement in Crown Point, also that crosscutting at the south end of Ophir had developed the fact that a rich projection of the Consolidated California and Virginia runs right straight into it. Also that steam was being gotten up at the Yellow Jacket new works with the intention of pumping out Gold Hill forthwith. As regards the Ophir rumor, nothing satisfactory can be obtained at headquarters regarding it, and we must patiently await progress of development. The assessment of 50 cents on Ophir is tangible enough, and there are plenty of other mines in the long list which must also be assessed in due time. The Baltimore has been demonstrated to contain good deposits of paying ore, and has as good surface machinery as is to be found on the Comstock. The Bullion has good ore at its northern end, which is to be extracted through the old Ceres shaft, very neat and efficient new hoisting works being just completed for the purpose. A fine body of high-grade ore is being developed, and Chollar also shows a good vein of ore at its southern boundary, running into Potosi. Savage has an extensive body of high-grade, being explored by the winze below the 600 level, and the newly-found bonanza in the Consolidated California and Virginia still holds out its good showing and yield, although, as before stated, some of the winze and drift openings have run through into porphyry and low-grade ore.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

GLADSTONE G. & S. M. Co., Dec. 17. Location, Storey Co., Nev. Directors—J. B. Dayton, A. V. Lancaster, E. M. Hall, C. E. Watkins and W. H. Loftus.

PACIFIC PINE LUMBER Co., Dec. 17. Object, to buy and sell lumber (by the cargo); also real estate, to do a general banking and mercantile business in this city. Capital stock, \$10,000 in \$5 shares. Directors—A. D. Moore, C. S. Holmes, Charles Hanson, W. J. Adams, A. W. Jackson, E. M. Herrick and W. H. Talbot.

LOCOMOTIVE M. Co., Dec. 20. Location, Pima Co., Arizona. Capital stock, \$10,000,000. Directors—Horace Baker, J. D. Dawson, H. B. Murray, George R. Wells and John F. Willis.

COMMERCIAL BUILDING AND LOAN ASSOCIATION, Dec. 20. Object, accumulating and loaning money to members. Capital stock, \$1,000,000 in \$200 shares. Directors—C. Shipper, F. A. Hornblower, J. Rafferty, F. E. Myers, A. Vignier, J. Knarston and F. Kleebauer.

WEST POTOMI M. Co., Dec. 21. Location, Nev. Capital stock, \$10,000,000. Directors—C. W. Kellogg, Thomas Cole, J. B. Dayton, J. L. Browne and P. A. Humbert.

KENNEDY M. & M. Co., Dec. 20. Object, reducing ores and metals in this city. Capital stock, \$10,000,000. Directors—Thomas Varney, M. W. Belshaw, F. Reichling, R. W. Gorrill and John Barton.

SILVER CITY G. & S. M. Co., Dec. 20. Location, Nevada. Capital stock, \$10,000,000. Directors—John Landers, G. W. Britain, H. Zadig, A. Hinz and G. Frier.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. Virginia and California, Dec. 19, \$105,000; Moulton, 15, \$19,840; Silver Bow, 15, \$20,304; Lexington, 15, \$23,032; Hanauer, \$4510; Bannock, 14, \$1700; Queen of the Hills, 14, \$1630; Hanauer, 15, \$4475; Bannock 15, \$1885; Queen of the Hills, 15, \$1375; Hanauer, 17, \$3720; Queen of the Hills, 17, \$1195; Hanauer, 18, \$3800; Bannock, 18, \$1836; Stormont, 19, \$2554; Hanauer, 19, \$6450; Queen of the Hills, 19, \$1390. The shipments of ore and bullion out from Salt Lake City for the week ending Saturday, Dec. 18, inclusive, were 18 cars of bullion, 552,383 lbs.; 8 cars silver ore, 234,850 lbs.; 8 cars copper ore, 223,800 lbs.; total, 34 cars, 1,011,033 lbs.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

## New York Metal Market.

Telegraphic advices dated Dec. 23d give the following New York prices:

BAR SILVER—\$1.99 1/2 per oz.  
BORAX—5 1/2 @ 5 1/4 c.  
COPPER—LAKE—\$11 1/2 @ \$12.  
IRON—No. 1, \$18.50 @ \$19.50.  
LEAD—\$4.85 @ \$4.95.  
QUICKSILVER—52 1/2 @ 53c.

The following is the latest by mail from the "New York Metal Exchange Market Report":  
COPPER—Neglected, spot closing at 11.95 @ —.  
Transferable Notices (Lake) issued at 11.95.  
Transferable Notices (Chili Bars) issued at 13.95.  
LEAD—Quiet and steady at \$4.30 @ \$4.40 spot.  
Transferable Notices issued at \$4.32 1/2.  
TIN—Quiet at \$22.30 @ \$22.45. Transferable Notices issued at \$22.40.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$22.40 @ \$22.60; Billiton Tin, \$23.00 @ \$23.10; Banca Tin, \$23.00 @ \$23.50; Baltimore Copper, \$10.35 @ \$10.95; Orford Copper, \$10.50 @ \$11.00; P. S. C. Copper, \$10.25 @ \$11.00; Foreign Lead, \$4.40 @ \$4.80; Foreign Spelter, \$4.35 @ \$4.75.  
MAKER'S PRICES—At tidewater. 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$20.00 @ \$20.50; No. 2, \$18.50 @ \$19.00; Grey Forge, \$17.00 @ \$18.00; Hudson River, Grade No. 1, \$19.50 @ \$20.00; No. 2, \$18.50 @ \$19.00; Grey Forge \$16.00 @ \$16.25; Southern, Grade No. 1, \$19.50 @ \$20.50; No. 2, \$18.00 @ \$18.50; Grey Forge \$17.00 @ \$17.50.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

CARRYING COALS TO NEWCASTLE.—In conversation with Mr. C. H. Evans, successor to Thomson & Evans, 110 and 112 Beale street, this city, it was learned that a crank and fly-wheel steam pump has been recently made by him for the U. S. Government, ordered by the quartermaster at Jeffersonville, Ind. This is the second order received from that department, and speaks highly for one branch of our coast manufactures.

At present there is a marked influx of Eastern immigrants into various parts of the State by all the railroads. A train carrying 650 passengers left Kansas City for Los Angeles on the 9th instant, and even larger parties are to follow.

By C. H. AARON.

## PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

## Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scoriaficing; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 252 Market street, San Francisco.

## PARTS II and III.

## Lead, Copper, Tin, Mercury, etc. Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

## Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Processes; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of

## About Obtaining Patents.

### Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

### Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of \$5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however, and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of \$20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds \$40, and for this we do all we can without appealing the case.

### Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings of a prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

### Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 26 years. Few agents, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications intrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily—when distant agents are employed—is wasted in preliminary writing back and forth.

This happy-combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

### Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee is \$10 additional. To enable us to prepare caveat papers, we require only a sketch and description of the invention.

### Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

## Golconda Mining Company.—Location of principal place of business, San Francisco, California.

Location of works, Calico Mining District, San Bernardino County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 22d day of December, 1886, an Assessment, No. 2, of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 27th day of January, 1887, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Wednesday, the 16th day of February, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. M. BUFFINGTON, Sec'y.

OFFICE—Room 4, 309 California St., San Francisco, Cal.

659 Clay St., S. E. cor. Kearny, S. F.

### A CHANCE TO INVEST.

A patent was granted me Sept. 9, 1886, on a STATION INDICATOR. The design of the invention is to show passengers on railroads or street cars the names of stations or streets when or before they arrive at them. A bell gives warning, and at the same time a hand on a dial-plate points to the name of the next street or station. The working has been tried and proved successful. The inventor is desirous of forming a company to get further patents, and to manufacture and introduce the article in the U. S. of America. For further information, address,

G. H. BADE,  
Prescott House, San Francisco.

## Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by DEWEY & Co., Publishers, 252 Market St., San Francisco.

## COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for \$2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

## HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

**PLANTS FOR GOLD AND SILVER MILLS,**  
embracing machinery of LATEST DESIGN and  
MOST IMPROVED construction. We offer our cus-  
tomers the BEST RESULTS OF 35 YEARS' EX-  
PERIENCE in this SPECIAL LINE of work, and  
are PREPARED to furnish from SAN FRAN-  
CISCO or CHICAGO, the MOST APPROVED  
character of MINING AND REDUCTION MA-  
CHINERY, adapted to all grades of ores and SU-  
PERIOR to that of any other make, at the LOWEST  
POSSIBLE PRICES.  
We are also prepared to CONSTRUCT and DE-  
LIVER in COMPLETE RUNNING ORDER,  
in any locality, MILLS, CONCENTRATION  
WORKS, WATER JACKET SMELTING  
FURNACES, HOISTING WORKS, PUMP-  
ING MACHINERY, ETC., ETC., of any DE-  
SIRABLE CAPACITY.

### WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD  
ores of NEW and ORIGINAL DESIGNS, covered  
by LETTERS PATENT. No other Furnace CAN  
COMPARE with these for DURABILITY, and in  
CAPACITY for uninterrupted work. MORE  
THAN 150 of them are now RUNNING in various  
parts of THIS COUNTRY, as well as many in  
FOREIGN COUNTRIES, giving results NEVER  
BEFORE ATTAINED as regards CONTINU-  
OUS running, ECONOMY of fuel, AMOUNT and  
QUALITY of BULLION produced. These  
CLAIMS have been PROVEN BY RESULTS in  
ANY NUMBER of INSTANCES, and the  
GREAT SUPERIORITY of this SYSTEM  
of smelting ores DEMONSTRATED BEYOND  
QUESTION. COMPLETE PLANTS furnished  
to order of any CAPACITY, with ALL IM-  
PROVEMENTS that experience has DEMON-  
STRATED as VALUABLE in this class of work.

Beyond question the cheapest and  
most effective machine of the kind  
now in use adapted to all grades and  
classes of ores.

This machine has been THOROUGHLY TESTED  
for the past TWO YEARS, under a GREAT VA-  
RIETY of CONDITIONS, giving most EXTRA-  
ORDINARY results FAR IN ADVANCE of  
anything EVER BEFORE REALIZED. A re-  
cent COMPETITIVE TEST at the Carlisle Mine in  
Mexico, showed an ADVANTAGE OF OVER 30  
PER CENT in favor of THE DUNCAN. The  
amount SAVED OVER THE TRUE being suffi-  
cient to PAY THE ENTIRE COST of the ma-  
chines EVERY MONTH OF THE YEAR. One  
of its MOST VALUABLE features is as an AMAL-  
GAMATOR. It saves all THE AMALGAM GOLD  
and SILVER that ESCAPES the BATTERIES,  
PANS or SETTLERS, making the machine worth  
MORE than ITS COST for THIS PURPOSE  
ALONE.

### BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a  
FIRST-CLASS HOIST, and affording means for the  
CONTINUOUS OPERATION of a BLOWER,  
WITHOUT interfering with the HOISTING AP-  
PARATUS. It is made ENTIRELY OF IRON,
